BIOGRAPHY.

The names of those living at the time of the continuous publication of the 'English Cyclopædia of Biography,' are preceded by an asterisk.

GADDI.

GADDI. The name of a celebrated old Florentine family of artists of the 13th and 14th centuries.

GADDO GADDI, the contemporary and friend of Andrea Tafi and Cimabue, was born at Florence in 1249, according to Vasari. Gaddo was a painter and mosaic-worker, and assisted Tafi in the mosaics of San Giovanni. He executed alone the mosaic of the 'Coronation of the Madonna,' in Santa Maria del Fiore, which is still extant. This work obtained him a reputation all over Italy, and he was ordered in 1308 by Clement V. to Rome, to execute some mosaics in the new church and palace of San Giovanni in Laterano, which was rebuilt after the fire of 1307. He executed other works in St. Peter's, and in Santa Maria Maggiore, which last still exist. There is also a Madonna by him in mosaic in the cathedral of Pisa. He executed some paintings in 'tempera,' but they have all perished. He died in 1312, and was buried in Santa Croce, where his son Taddeo painted his portrait beside that of Andrea Tafi, in a 'Marriage of the Virgin' in the Capella Baroncelli.

TADDEO GADDI, born in 1300, was a much more able man than his father, after whose death he lived twenty-four years with Giotto, who was his godfather. He was the most distinguished of Giotto's scholars and imitators.

Vasari mentions the paintings of the sacristy of Santa Croce in Florence, as Taddeo's first works; the altar-piece, however, of this chapel is altogether similar to the other paintings, and it bears the date of 1378, which was some years after the death of Taddeo: the portion which Vasari attributes to Taddeo are the five subjects from the life of the Magdalen. The frescoes of the Baroncelli (now Giugni) chapel in the same church, representing the life of the Virgin, also by Taddeo, according to Vasari, are in a different style, and in one which assimilates more with the characteristic style of the period. Taddeo enlarged somewhat upon the style of Giotto; he gave more bulk and motion to his figures. The frescoes of this chapel are perhaps the best of his works that remain: they have been engraved by Lasinio. Taddeo painted also in Santa Maria Novella and other churches at Florence, and at Arezzo, and in 1342 at Pisa; but little remains of his works besides those mentioned above, and a few small altar-pieces in tempera, in the gallery of the academy at Florence and at Berlin.

In Santa Maria Novella, Taddeo painted in fresco a wall and the ceiling of the Capella degli Spagnuoli, formerly the chapter-house. The ceiling represents the Resurrection and the Ascension of Christ, the 'Descent of the Holy Ghost,' and 'Peter saved from Shipwreck': in the 'Resurrection' light proceeds from the body of Christ. The painting of the wall is apparently an allegory to the glory of St. Thomas Aquinas, commemorating his extensive knowledge and his great services to the church. The other walls of the chapel were painted by Memmi at the same time as the works of Taddeo were executed, but are much inferior to them; on one of the walls are the reputed portraits of Petrarch and Laura. Taddeo's works in this chapel are the most considerable efforts in painting of the 14th century; but they are not in a sufficient state of preservation to judge adequately of their merits, though sufficient to justify his reputation as the best craftsman of his age or century. In composition he was symmetrical and nude, in character natural, and in expression not superior but equal to Giotto. Taddeo was likewise a distinguished architect; he built the present Ponte Vecchio in 1345, and the Ponte della Trinità, which was destroyed by the flood of 1557, and was replaced by the present bridge by Ammanati.

BIOG. DIV. VOL. III.

GAERTNER, JOHANN ANDREAS.

Taddeo Gaddi amassed great wealth, by means of which he established his family, and the Gaddi have been for many centuries one of the most distinguished families of Florence. It is not known when Taddeo died, but Rumohr has shown that he was still living in 1366. He was buried near his father in Santa Croce.

His most distinguished scholars were Giovanni da Milano and Jacopo da Casentino, to whom he intrusted the care of his sons Giovanni and Angelo. Giovanni died young, after giving great promise as a painter.

ANGELO GADDI was born about 1326, died in 1389, according to Vasari and Baldinucci. He excelled in colour, and generally in the technical practice of the period, which appears to have been thoroughly established in his time. He executed several great works, especially in Santa Croce, where he painted the history of the Discovery of the Cross; but they are all in imitation of Giotto and his father, though he was inferior to both in expression and to his father in design. He executed many works in Florence in various churches; and he visited Venice not only in the capacity of a painter but as a merchant also. He established a commercial house there, together with his sons, and realised a great fortune: his sons devoted themselves exclusively to mercantile pursuits.

Angelo left two distinguished scholars—Stefano da Verona, and Cennino Cennini, who is the author of the earliest known treatise on painting—'Trattato della Pittura,' Rome, 1821: it was written in 1437.

(Vasari, *Vite de' Pittori*, &c.; Speth, *Kunst in Italien*; Rumohr, *Italienische Forschungen*.)

GADEBUSCH, FREDERIC CONRAD, a learned German, born in 1719, in the island of Rugen. After having studied at different universities of Germany, he went, in 1750, to Livonia, where he remained till his death in 1788. He was a very laborious writer, and left several works in German, which throw considerable light on the history of the Baltic provinces of Russia. His principal works are—'Memoir on the Historians of Livonia,' Riga, 1772; 'Livonian Bibliotheca,' Riga, 1779; 'Essays on the History and Laws of Livonia,' Riga, 1777-85; 'Annals of Livonia, from 1030 to 1761,' 8 vols. in 8vo, Riga, 1780-83.

GAERTNER, or GÄRTNER, JOHANN ANDREAS. Descended himself from a family of architects, Johann Gärtner claims notice both on account of his own professional talents, and as being the father of the celebrated FRIEDRICH VON GAERTNER, noticed below. Johann Andreas was the son of a former Andreas, a Dresden architect and artist of considerable reputation in the early part of the last century; and was the nephew of Johann Gärtner, a clever architect of the same period and the same place. He was born at Dresden in 1743, and was at first more inclined towards the military profession; but going to Poland he was induced by Count Minitszek not to give up architecture entirely, but rather to apply himself to engineering also, and he was employed by that nobleman to erect various buildings upon his estates. After that he visited Vienna, Berlin, and Paris, in which last capital he remained nine years, when he was invited to Coblenz, to finish the Residenz or electoral palace there. He next entered the service of the Prince-bishop of Würzburg, being glad to quit Coblenz (where his son Friedrich was born), the disturbances arising out of the French Revolution having both rendered that city an insecure place of abode, and cut off all prospect of professional employment. He erected several buildings at Würzburg and in its neighbourhood, all of which display superior talent and taste; among others the theatre, the restorations

of the church of St. Michael at Würzburg, and Count Schönborn's château at Gumbach; and he continued to reside at Würzburg until political changes had annexed it to Bavaria, and after he himself had been nominated as a Bavarian architect, for he did not remove to Munich till 1804, when he had been appointed Hofbauintendant there. He did not however find opened to him in that capital the enlarged scope for the display of his abilities which he had promised himself, for of the various designs which he produced, scarcely any—none of the more important ones—were adopted for execution. Towards the close of his life he felt the disappointment so bitterly, that instead of selecting his best designs and publishing them as a memorial of his talents, he destroyed them with his own hands, as if to prevent others from availing themselves of the ideas which he had been able to work out only upon paper. Could he have foreseen how much more prosperous a career was reserved for his son, he would probably have borne his own disappointments with less impatience of temper. He died in 1826, aged eighty-three.

GAERTNER, or GÄRTNER, FRIEDRICH VON, architect, was born at Coblenz in 1792, and was the son of Johann Andreas Gaertner. Brought to Munich at an early age, he received a general scientific education, and in 1809 entered the Academy of Arts in order to devote himself specially to architecture. After three years he went to Paris, to enter the Academy there; and here he enlarged his knowledge under the guidance of Percier. France had been during many years regarded as the school of Germany in art—for German art was then only about to re-assert independent character, such as under Gärtner and other artists it soon acquired. In 1814 Gärtner went to Italy, where he remained four years. He visited Rome, Naples, and other places of general interest, but would appear to have devoted himself to the antique monuments as much as to later works, although it is the character of the Byzantine and early Italian styles to which the designs in his own buildings are nearest allied. He especially studied the ruins in Sicily, including those at Girgenti, Segesta, and Taormina, which he drew and published in lithography, in 1819, in a work entitled 'Views of the best preserved Greek Monuments of Sicily, with Explanatory Text.' In 1819 also he came to England, and was induced to think of residing here; but in 1820, being made professor of architecture in the Munich Academy, he was from that time engaged in Bavaria. Well qualified by his studies and taste to co-operate in the grand revival fostered by the Crown Prince (afterwards Louis of Bavaria), Gärtner became connected with several important branches of manufacture. The superiority in forms and character attained in the works of the porcelain factory, of which he became director in 1822, was due to him, as also in great part was the revival of glass-painting. In 1829 the sphere of his influence was enlarged. King Louis, appreciating his talent, instructed him to design the Ludwigs-Kirche, which eventually was magnificently decorated internally with the aid of the painter Cornelius. Near the church is the great library and record-office, by the same architect. In 1833 he commenced the Blinden-Institut. Amongst his other buildings about the same time, or subsequently, were the University, the Erziehungs-Institut, the Damenstift, the Priester-Seminar, the Salzamt, the Ludwigs-thor, and the Feldhernnhalle, all at Munich. Besides these he built the palace at Wittelsbach, the pump-room at Kissingen, and the Befreiungshalle at Kelheim—a great monument in the form of a rotunda, designed to commemorate the liberation of Germany.

In 1836 Gärtner accompanied the king to Athens to study the Greek monuments, and there he was directed to design a new Residenz, or palace, for King Otho. At Athens he re-opened the quarries of Pentelic marble, said to have been forgotten since the time of Hadrian. On his return, he was appointed oberbaurath, or architect to the court, and received the order of Civil Merit of the Crown of Bavaria; and on the departure of Cornelius for Berlin in 1841, he was made Director of the Academy of Arts. In addition to the works above mentioned, Gärtner was architect of the Pompeian House at Aschaffenburg—one of those efforts to collect a series of examples of styles, through which, in consequence of that aim, the value of King Louis's still great services to art is reduced. Gärtner also restored the Isar-thor, and portions of the cathedrals at Regensburg and Bamberg. He died on the 21st of April 1847, aged fifty-five years.

Gärtner's style, as described by Raczyński ('Histoire de l'Art Moderne en Allemagne'), is one which "recalls" the idea of the Byzantine; which, as a general statement, is correct. The University and the Bibliothek have however a marked Florentine character. The architect constantly uses the arch-headed window, divided into two lights by a centre-column, and avoids the characteristics of the late Italian styles,—whilst ornament of original character is freely introduced. Much of the fame of Munich for interior decoration in buildings, and the influence of which has spread even to this country, is due to Gärtner. A publication of his designs was commenced about 1844 or 1845.

GAFFURIUS. [GAFORIUS.]

GAFORIUS, FRANCHINUS, or FRANCHINO GAFORI, a very learned writer on music, was born of humble parents at Lodi in 1451. In his boyhood he was devoted to the service of the church, and among other branches of knowledge to which he applied himself with marked diligence, he studied music under a Carmelite friar named Godendach, of which science, both theoretically and practically, he

became a complete master. It does not seem certain that the sacerdotal dignity was ever conferred on him, though it has been confidently stated that he entered into holy orders. He first went to Verona, publicly taught music there during some few years, and also wrote his work, 'Musice Institutiones Collocationes.' The reputation he thereby acquired procured him an invitation from the Doge to visit Genoa, which he accepted, but soon after proceeded to Naples, where he met Tincto, Garnerius, Hycart, and other celebrated musicians, and, according to the usage of the time, held public disputations with them. At Naples he also produced his 'Theoricum Opus Harmonice DisCIPLINAE.' But the Turks having brought war and the plague into the Neapolitan territory, he was driven from that part of Italy, and by the persuasion of Pallavicini, bishop of Monticello, returned to Lodi, gave lectures on music, and began his 'Practica Musicae utriusque Cantus,' his greatest work, which was first printed at Milan in 1496. Of this, Sir J. Hawkins has given a copious abstract, an honour to which it was entitled, not only on account of its intrinsic merit, but because it is the first treatise on the art that ever appeared in print. It is full of that kind of information which was called for, and proved eminently useful at the period in which it was published, quickly spreading the author's fame throughout Europe; but, touched by the pedantic spirit of the age, he invented terms that must have cost him vast labour to compound, and which doubtless exacted no less from his readers to understand. His work lying before us, we are tempted to give a specimen of the language of art adopted in the 15th century, as it appears in the heading of one of his chapters: 'De Proportione Subquadruplasupertripartientiquarta.'

Gaforius (erroneously called Gaffurius by Hawkins, Burney, &c.) wrote other works, which were held in high estimation. It is supposed that he died in or about the year 1520.

GAGERN, HANS CHRISTOPH ERNST, FREIHERR (Baron) VON, was born January 25, 1766, at Klein-Niedesheim, near Worms, in the German duchy of Hesse-Darmstadt. He completed his studies at the universities of Leipzig and Göttingen. At an early age he entered the service of the Prince of Orange-Nassau, and was employed as a minister, and sent as an ambassador to Paris. When the Prince of Orange in 1814 became the sovereign of Holland, Baron von Gagern became his prime-minister, and in 1815 was his ambassador to the Congress of Vienna. The Prince of Orange having become King of the Netherlands, Baron von Gagern continued to be his principal minister, and was employed on important occasions as his ambassador. In 1820 the King of the Netherlands rewarded his services by a pension, and he then retired to reside upon his estate at Hornau in the duchy of Hesse-Darmstadt, where he died Oct. 22, 1852, at the age of ninety. He is the author of several valuable works on subjects of history, politics, and national law.

* GAGERN, HEINRICH WILHELM AUGUST, FREIHERR VON, was born August 20, 1799, at Baireuth, in the kingdom of Bavaria, and is a son of the preceding baron. He studied in the universities of Göttingen, Jena, and Heidelberg. He entered the service of the Grand Duke of Hesse-Darmstadt, and in 1829 became a member of the government-council. In 1832 he was appointed Controller of the Ministry of the Interior and of Justice. When the German parliament was assembled at Frankfurt for the purpose of forming a confederation of the smaller states under a central government, Heinrich von Gagern was appointed president, May 19, 1848; and on the 30th of June, when his first term of office expired, he was re-elected. On the 18th of December he resigned the presidency of the assembly, and Eduard Simson of Königsberg was elected as his successor, the Baron von Gagern being nominated by the Regent of the Empire to the offices of Minister of Foreign Affairs and President of the Council of Ministers. After many discussions it was resolved, March 28, 1849, that the German states should be constituted an empire, and that the imperial dignity should be offered to the King of Prussia. The offer was accordingly made, and negotiations between the parliament and the king continued for some time; but the king ultimately refused to accept the dignity, under the conditions proposed, and the assembly was dissolved without producing any result.

GAIL, JEAN BAPTISTE, born at Paris in 1753, distinguished himself in the study of Greek, and was made, in 1791, Professor of Greek Literature in the Collège de France. In 1794 he married Mademoiselle Sophie Garre, who afterwards acquired celebrity as a musical composer. Jean Baptiste Gail wrote numerous works, chiefly translations from the Greek; a Greek grammar, 1799, with a supplement, or 'Essai sur les Prépositions Grecques considérées sous le rapport Géographique,' 1821; and 'Cours de Langue Grecque, ou Extraits de différens Auteurs,' in four parts, 1797-99. He wrote also 'Observations sur les Idylles de Théocrite et les Eclogues de Virgile,' 1805; and lastly he furnished the materials for the 'Atlas contenant par ordre de temps, les Cartes relatives à la Géographie d'Herodote, Thucydide, Xenophon, les plans de bataille,' &c., 4to, Paris; to which are added 'Observations Préliminaires,' and an Index, by Gail. Gail was made Knight of the Legion of Honour by Louis XVIII, and Knight of St. Wladimir by the Emperor Alexander.

GAILLARD, GABRIEL HENRI, a celebrated modern French historian, was born in 1726. After receiving a good education, he was admitted advocate at an early age, but he soon left the bar in order to devote himself entirely to literature. In 1745, when he was only

nineteen years old, he wrote a treatise on rhetoric for the use of young ladies. In 1757 he published the 'History of Mary of Burgundy,' daughter of Charles the Bold and wife of the emperor Maximilian I., a work which had great success. In 1766 was published his 'History of Francis I. of France.' The subject is well treated, though Gaillard presented it in a rather uninviting form for the generality of readers, having divided the history of that celebrated reign into separate parts, such as civil, political, military, ecclesiastical, and literary history, the private life of the king, &c. He adopted the same plan in his 'History of Charlemagne,' 1782, in 4 vols. 4to. Besides the objection to his mode of dividing the subject-matter, it was further objected to the 'History of Charlemagne' that Gaillard had sunk the biography of his hero between two long dissertations on the first and second races of the French kings. The best work of Gaillard is his 'History of the Rivalry between France and England,' of which the first three volumes appeared in 1771, the four following in 1774, and the four concluding volumes in 1777. This work embraces not only the political and military relations between the two countries, but also the internal history of both, so arranged as to present a constant parallelism. His 'History of the Rivalry between France and Spain,' 8 vols. 12mo, a work highly appreciated in France, is written on the same plan. Gaillard was the author of the 'Historical Dictionary' in the 'Encyclopédie Méthodique,' 6 vols. 4to, and many other minor works, the most valuable of which are a 'Life of Malesherbes,' his personal friend, 1805, 1 vol. 8vo; and 'Observations on the History of France,' by Velly, Villaret, and Garnier, 4 vols. 12mo, 1806. Gaillard died in 1806, in consequence of his severe application. His moral character stood very high.

GAINSBOROUGH, THOMAS, born in 1727, at Sudbury in Suffolk, was one of the most eminent English landscape-painters of the last century. His father being a person in narrow circumstances, the education which his son received was very scanty; and it is probable enough that in his boyish days he passed much less time at school than in the woods of Suffolk, where he acquired that relish for the beauties of quiet nature and that intimate acquaintance with them for which his early pictures are so peculiarly distinguished. Having almost from his childhood amused himself with sketching any object that struck his fancy, an old tree, a group of cattle, a shepherd and his dog, &c., he ventured on colouring, and had painted several landscapes before he was fourteen years of age, when he was sent to London. There he was for some time with Mr. Gravelot, the engraver, and Hayman, the painter, with whom he did not remain long, but, setting up as a portrait-painter, supported himself, till at the age of nineteen he married a young lady who had a fortune of 200*l.* per annum. On his marriage he went to Ipswich, where he resided till 1760, when he removed to Bath. Having practised portrait-painting with increasing success, he removed in 1774 to London; and having painted portraits of some of the royal family, which were much admired, he soon acquired extensive practice and proportionate emolument. But though his portraits were much valued at the time as striking likenesses, this was too frequently their chief merit: they were often painted in a rough careless manner, in a style of hatching and scumbling entirely his own, producing indeed an effect at a distance, but undetermined and indistinct when viewed near. At times he would take more pains, and show what he could do. But Gainsborough in fact considered this loose manner as so peculiarly characteristic, if not excellent, that he was desirous that his pictures in the exhibition might be so hung as to be within reach of close inspection. Gainsborough was one of the thirty-six members chosen at the foundation of the Royal Academy, and at the first exhibition of the academy in the following year he contributed two portraits, a boy's head and a large landscape.

The fame of Gainsborough now rests on his landscapes, to the painting of which he more and more devoted himself from the time of his removal to London; and what might be called fancy-pieces, such as the celebrated 'Cottage-Door,' now in the collection of the Marquis of Westminster. But in speaking of his landscapes, there must be remarked a striking difference between his early and his later performances. In the former every feature is copied from nature in great detail, and yet without stiffness; so that they, in a measure, look like nature itself reflected in a convex mirror. In his latter works striking effect, great breadth and judicious distribution of light and shade, and depth, glow, and richness of colour, produce a grand and even a solemn impression. Both styles have their admirers; but in the present fashionable tendency to minute imitation, Gainsborough's most highly-detailed early landscape would be probably regarded as coarse and unfinished. Gainsborough may not deserve to be ranked, as some would have him, with Vandyck, Rubens, and Claude, in portrait and in landscape, yet all will assent to the opinion of Sir Joshua Reynolds—"That if ever this nation should produce genius sufficient to acquire to us the honourable distinction of an English school, the name of Gainsborough will be transmitted to posterity as one of the very first of that rising name." He was in fact the first really original English landscape-painter. Every work of his pencil bears upon it a marked impress. A landscape by Gainsborough—even though one of his earlier works—is never a mere view of a particular spot, but a poetic rendering of the scene as coloured by the imagination of the artist, and a realisation, as far as may be, of the idea it has assumed in his mind.

Gainsborough died of a cancer in the neck, August 2nd, 1788, in the sixty-first year of his age.

(Cunningham, *Lives of British Painters*; Fulcher, *Life of Gainsborough*, 1856.)

GAIVS, or CAIVS, one of the Roman classical jurists whose works entitle him to a place among the great writers on law, such as Papinian, Paulus, and Ulpian. Nothing is known of the personal history of Gaius beyond the probable fact that he wrote under Antoninus Pius and Aurelius. His works were largely used in the compilation of the 'Digest,' or 'Pandect,' which contains extracts from the writings of Gaius under the following titles:—'Res Cottidianæ sive Aureorum,' (Dig. xl. 9, 10, &c.); 'De Casibus,' (xii. 6, 63, &c.); 'Ad Edictum Ædilium Curulium,' (xxi. 1, 18, &c.); 'Liber ad Edictum Prætoris Urbani,' (xl. 12, 6, &c.); 'Ad Edictum Provinciale,' (xiv. 4, 9, &c.), which consisted of thirty books at least; 'Fidei Commissorum,' (xxxii. 1, 14, &c.); 'Formula Hypothecaria,' (xx. 1, 4, &c.); 'Institutiones,' (i. 6, 1, &c.); 'De Verborum Obligationibus,' (xvi. 1, 70). There are also extracts from several other works of Gaius in the 'Pandect.'

The 'Institutiones' of Gaius were probably the earliest attempt to present a sketch of the Roman law in the form of an elementary textbook. This work continued in general use till the compilation of the 'Institutiones' which bear the name of Justinian, and which were not only mainly based on the 'Institutiones' of Gaius, but, like this earlier work, were divided into four books, with the same general distribution of the subject-matter as that adopted by Gaius.

The 'Institutiones' of Gaius appear to have been neglected after the promulgation of Justinian's compilation, and were finally lost. The detached pieces collected in the 'Digest,' and what could be gathered from the 'Breviarium Alaricianum,' as the code of the Visigoths is sometimes called, were all that remained. But in 1816, Niebuhr discovered a manuscript in the library of the chapter of Verona, which he ascertained to be a treatise on Roman law, and which Savigny, founding his opinion on the specimen published by Niebuhr, conjectured to be the 'Institutiones' of Gaius.

This conjecture of Savigny was soon fully confirmed, though the manuscript has no author's name on it. Goeschen, Bekker, and Hollweg undertook to examine and copy this manuscript, an edition of which appeared at Berlin in 1820, edited by Goeschen. To form some idea of the labour necessary to decipher this manuscript, and of the patient perseverance of the scholars who undertook this formidable task, the reader must refer to the report of Goeschen to the Academy of Berlin, November 6, 1817. The manuscript consists of one hundred and twenty-seven sheets of parchment, the original writing on which was the four books of the 'Institutiones' of Gaius. This original writing had on some pages been washed out, so far as was practicable, and on others scratched out; and the whole, with the exception of two sheets, had been re-written with the epistles of St. Jerome. The lines of the original and of the substituted writing run in the same direction, and often cover one another; a circumstance which considerably increased the difficulty of deciphering the text of Gaius. In addition to this, sixty-three pages had been written on three times: the first writing was the text of Gaius, which had been erased; and the second, which was a theological work, had shared the same fate, to make room for the epistles of St. Jerome.

A second examination of this manuscript was made by Bluhme ('Præfatio Novæ Editionis'), and a new edition of the 'Institutiones' was published by Goeschen, at Berlin, in 1824, which presents us with an exact copy of the manuscript with all its deficiencies, and contains a most copious list of the abbreviations used by the copyist of Gaius.

The discovery of a work, the loss of which had so long been regretted, produced a most lively sensation among continental jurists, and called forth a great number of essays. In England it attracted comparatively little attention, though it is undoubtedly one of the most valuable additions that have been made in modern times to our knowledge of Roman Law. The fourth book of the 'Institutiones' is particularly useful for the information which it contains on actions and the forms of procedure. The style of Gaius, like that of all the classical Roman jurists, is perspicuous and yet concise.

Among the most useful editions of Gaius is that by Klenze and Böcking (Berlin, 1829), which contains the 'Institutiones' of Gaius and Justinian, so arranged as to present a parallelism, and to furnish a proof, if any were yet wanting, that the manuscript of Verona is the genuine work of Gaius; and Böcking's subsequent edition, 12mo, Bonn, 1841.

In addition to the references already made, the reader may consult an ingenious essay by Goeschen on the 'Res Quotidianæ,' of Gaius, *Zeitschrift für Geschichtliche Rechtswissenschaft*, Berlin, 1815; Hugo, *Lehrbuch der Geschichte des Römischen Rechts*; Dupont, *Disquisit. in Commentarium iv. Instit. Gaii, &c.*, Lugd. Bat. 1822; Huschke, *Zur Kritik und Interp. von Gaius Instit.*, in his *Studien des Röm. Rechts*, 8vo, Bres. 1830. The Institutes of Gaius have been translated into French by Boulet, 1826; Domenget, 1843; and Pellat, 1844, &c.; and the first book into German by Von Brockdorff, 1824.

*GAJ, LJUDEVIT, the founder of modern Illyrian literature, was born about 1810, at Kropina in Croatia, where his father was an apothecary. Gaj studied law at Peth, and there came under the

influence of Kollar, the Slovakian poet, who, born in Hungary, but of a Slavonic stock, had adopted the kindred language of Bohemia as the vehicle of his genius. Gaj, who afterwards studied in some of the German universities, returned to Croatia about 1835, where he proposed to establish a periodical publication in the Croatian language. To do this, as Croatia was an Hungarian province, it was necessary to apply to the Hungarian authorities for permission, and it was refused. Gaj then applied to the Austrian government direct, and the permission is said by some to have been granted at a personal audience by the Emperor Francis, with the purpose of baffling the views of the Hungarians for the extension of their language, which they had already succeeded in introducing into the schools of Croatia. The Croatian newspaper was successful, and its editor's views began to enlarge. He perceived, that as his friend Kollar in the north of Hungary had abandoned Slovakian to write in Bohemian for a larger public, so the Slavonic dialects of the south of Hungary—Croatian included—would be intelligible to a large circle of readers if their provincial peculiarities were kept in the background, and their general resemblance more carefully attended to and made prominent. The Servians, the Dalmatians, the Bosnians, the Croats—all speak what is radically the same language, but so disfigured by different alphabets, and different systems of orthography, that the great fact has been kept out of view. Scattered under the Austrian and the Turkish government, and in one case independent, as in Montenegro—divided between the Greek and the Roman church, and in one case perverted to Mohammedanism, as in Bosnia—the great race of the South Slavonians is still essentially one, and if as much pains were taken to unite it as to keep it divided, a South Slavonic language and literature might extend from Turkey to within sight of Venice. Gaj's purpose was to further this end by obliterating provincial peculiarities from his Croatian, and writing what he proposed to call 'Illyrian,' which was to form a common standard for all the dialects. He gave to his newspaper the name of 'Ilirska Novina,' or 'The Illyrian News,' and to a literary supplement, published in connection with it, that of 'Danica Ilirska,' or 'The Illyrian Morning Star.' The movement met with much success, as a bevy of young authors appeared, who followed in the path which Gaj had pointed out. The opposition of the Hungarians furnished him with the exclamation, "You Magyars are but an island in the midst of a Slavonic ocean; if you stand too much in the way the waves will overwhelm you." In 1837 he published an Illyrian grammar, and soon after an Illyrian and German dictionary. He prepared a settled system of orthography, which was adopted by a considerable number of writers. His efforts were of course already distasteful to the Hungarians, and not thought to be entirely acceptable to the Austrians, whose attention was frequently called by his opponents to the danger of exciting a common feeling of Slavonic enthusiasm among populations not subject to a Slavonic government. The Servians were also found unwilling to call the language they spoke Illyrian, or to resign their Russian alphabet in favour of a Roman one, over which indeed their own presents many advantages. The great outbreak of 1848, in which Jellachich, the Ban of Croatia, was the champion at once of the national language, and of the Austrian government, seemed likely to decide the triumph of the Illyrian cause, but though the result of the struggle was the overthrow of Hungary, Illyrianism seems to have made less progress since than before. Gaj, who had taken an active part in the struggle, has been little heard of of late; it is certain that he is now looked on with suspicion by the Austrians, and it is said that he had been subjected to imprisonment for carrying too far his Slavonic tendencies. He is of some eminence as a poet, and a national ballad by him, in imitation of the popular Polish national song, 'Ieszcze Polska niezginie,' or 'Poland has not finished yet,' with the sentiment applied to Croatia, was a few years back on the lips of every Croat.

GA LANI'NO, the name by which Baldassare Aloisi is generally known. He was born at Bologna in 1578, was educated in the school of the Carracci, and became one of the most distinguished of the Italian portrait-painters: he is sometimes called the Italian Vandyck. He practised chiefly at Rome. Galanino was also a very able historical painter and a skilful etcher: he died in 1638.

GALBA, SE'RVIVS SULPIT'IVS, born under the reign of Augustus, of a patrician family, served with distinction in Germany, was afterwards proconsul, first in Africa, and afterwards in the Tarraconensis province of Spain, in which office he acquired a reputation for justice and moderation. He was still in Spain when Julius Vindex, the proconsul of Celtic Gaul, rose against Nero; Galba joined Vindex, and Otho, governor of Lusitania, followed his example. The assembled multitudes saluted Galba as emperor and Augustus, but he declared that he was only acting as the lieutenant of the senate and people of Rome, in order to put an end to the disgraceful tyranny of Nero. The Prætorian guards at Rome soon after having revolted against Nero, proclaimed Galba, and the senate acknowledged him as emperor. Galba hastened from Spain to Rome, where he began by calling to account those favourites of Nero who had enriched themselves by proscriptions and confiscations, and by the senseless prodigality of that prince; but it was found that most of them had already dissipated their ill-gotten wealth. Galba, or rather his confidants who governed him, then proceeded against the purchasers of their property, and confiscations became again the order of the day. At the same time

Galba exercised great parsimony in the administration, and endeavoured to enforce a strict discipline among the soldiers, who had been used to the prodigality and licence of the previous reign. The emperor, who was past seventy years of age, soon became the object of popular dislike and ridicule, his favourites were hated, and revolts against him broke out in various quarters, several of which were put down and punished severely. Galba thought of strengthening himself by adopting Piso Licinianus, a young patrician of considerable personal merit, as Cæsar and his successor; upon which Otho, who had expected to be the object of his choice, formed a conspiracy among the guards, who proclaimed him emperor. Galba, unable to walk, caused himself to be carried in a litter, hoping to suppress the mutiny; but at the appearance of Otho's armed partisans his followers left him; and even the litter-bearers threw the old man down and ran away. Some of the legionaries came up and put Galba to death, after a reign of only seven months, counting from the time of Nero's death, A.D. 68. Galba was seventy-two years of age at the time of his death. He was succeeded by Otho, but only for a short time, as Vitellius superseded him, and Vespasianus soon after superseded Vitellius. (Tacitus, *Histor.* i.—iv.)

Coin of Galba.

British Museum. Actual size. Brass. Weight 395 grains.

Reverses of coins of Galba.

GALENUS, CLAUDIUS, one of the most celebrated and valuable of the ancient medical writers, was born at Pergamum, A.D. 131. The exact time of his death is not known, but as he speaks of Pertinax and Severus as emperors, we may conclude that Suidas (v. Γαληνός) is not far from the truth in stating that he lived to the age of seventy. He was early instructed in the doctrines of the Aristotelian and Platonic philosophy, and appears also to have devoted some time to the study of the peculiar tenets of the other sects; for while yet very young, he wrote commentaries on the *Dialectics* of the Stoic Chrysippus.

His anatomical and medical studies were commenced under Satyrus, a celebrated anatomist; Stratoniceus, a disciple of the Hippocratic school; and Æschron, a follower of the Empirics. After the death of his father he travelled to Alexandria, at that time the most famous school of medicine in the world. His studies were so zealously and successfully pursued, that he was publicly invited to return to his native country. At the age of thirty-four he settled himself in Rome, when his celebrity became so great from the success of his practice, and more especially from his great knowledge of anatomy, that he quickly drew upon himself the jealousy of all the Roman physicians. At the solicitation of many philosophers and men of rank, he commenced a course of lectures on anatomy; but by the jealousy of his rivals he was quickly compelled to discontinue them, and eventually to leave Rome entirely.

The instruction which Galen had received in the principles of the various sects of medical philosophy, had given him an acquaintance with the peculiar errors of each, and he speaks of them all at times in the language of no measured contempt. The school which was founded by himself may justly merit the title of Eclectic, for its doctrines were a mixture of the philosophy of Plato, of the physics and logic of Aristotle, and of the practical knowledge of Hippocrates. On many occasions he expresses himself strongly on the superiority of theory to mere empiricism; but upon those matters which do not admit of being objects of experience, such as the nature of the soul, he confesses his ignorance and inability to give any plausible explanation.

But in order to form a correct estimate of the merits of this physician, it is necessary for us to mention particularly some of his contributions to medical science. Anatomy was at all times the favourite pursuit of Galen, but it does not appear that he had many opportunities of dissecting the human subject. This we may infer with certainty from the gratification he expresses at having discovered a human skeleton at Alexandria, and having been enabled to make observations on the body of a criminal which had remained without burial. His dissections were principally confined to the apes and lower animals; and it is to this circumstance that many of the errors in his description are referrible; for from the examination of these animals he attempted to infer analogically the structure of the human body. He describes the sternum as consisting of seven pieces instead of eight. He supposes the sacrum to consist of three pieces instead of five, and looks upon the coccyx as a fourth, whereas it is a distinct bone in men till twenty or twenty-five, and in women as late as forty-five.

His descriptions of the muscles appear to be more generally correct. He described for the first time two of the muscles of the jaws, and two which move the shoulder. In addition to these he discovered the popliteal muscles and the *platysma myoidea*. He denied the muscular texture of the heart on account of the complicated nature of its functions, but he gave a good description of its transverse fibres and its general structure. The knowledge of the vascular system which Galen possessed does not appear to have been greater or more accurate than that of his predecessors. He supposed the veins to originate in the liver, and the arteries to take their rise from the heart. He likewise showed by experiment, in opposition to Erasistratus, that the arteries contained blood, and not merely the animal spirits, as that physician maintained. He had observed the structure and use of the valves of the heart, and, arguing from their evident intention, concluded that a portion of the blood passed with the animal spirits from the pulmonary artery into the pulmonary vein, and so to the left side of the heart. He was also aware of the connection between the veins and arteries by means of the capillary vessels. The existence of the ductus arteriosus and foramen ovale during the stage of foetal life was not unknown to him, and he had also noticed the changes which they undergo after birth.

Galen understood generally the distinction between nerves of sensation and nerves of motion; but his knowledge upon this point does not appear to have been great, for he supposed that the former proceeded only from the brain, and that the latter had their origin exclusively in the spinal marrow. This opinion is the more remarkable, as he himself describes the third pair of cerebral nerves, or principal motor nerve of the eye. In his description of the cerebral nerves he notices the olfactory, though somewhat indistinctly, the optic, the third pair, two branches of the fifth, the two divisions of the seventh pair, and some branches of the par vagum and hypoglossal nerves; but he appears to have confounded these together very much in his description. He detected the mistake of those anatomists who thought there was an entire crossing of the optic nerves, but fell himself into the error of supposing that no decussation at all takes place.

In order to form correct physiological views, it is necessary to employ many and varied experiments, and to modify them in different ways, that we may be able to satisfy the numerous conditions which every problem in physiology presents. To this mode of inquiry Galen sometimes had recourse, and it were to be wished that he had more frequently made use of it. To prove the dependence of muscular motion upon nervous influence, he divided the nerves which supply the muscles of the shoulder, and found that after the division all power of motion ceased. But he does not seem to have noticed that the nervous influence is only one of the many stimuli which call the muscles into action. As he considered the heart to be devoid of nerves, he might have avoided this error, had he not fortified himself against the truth by assuming that its structure is not muscular. He also deprived animals of their voice by dividing the intercostal muscles, by tying the recurrent nerve, or by injuring the spinal cord. In theoretical physiology his arrangement of the vital phenomena deserves to be particularly recorded, as it forms the groundwork of all the classifications which have since been proposed. It is founded upon the essential differences observed in the functions themselves. Observing that some of them cannot be interrupted without the destruction of life, and for the most part are unconsciously performed, whilst another class may be suspended without injury, are accompanied by sensation, and subject to the power of the will, he divided the functions into three great classes. The vital functions are those whose continuance is essential to life; the animal are those which are perceived, and for the most part are subject to the will; whilst the natural are performed without consciousness or control. He then assumed certain abstract principles upon which these functions were supposed to depend. He conceived the first to have their seat in the heart, the second in the brain, and the third in the liver. Thus the pulsations of the heart are produced by the vital forces, and these are communicated to the arteries by the intervention of the *pneuma*; this is the more subtle part of the air, which is taken in by respiration, and conveyed from the lungs to the left side of the heart, and thence to the different parts of the body. In the brain the *pneuma* forms

the medium by which impressions from external objects are conveyed to the common sensorium. The same principle is applied to the explanation of the natural functions also. Observing that these forces are not sufficient for the explanation of the different vital phenomena, Galen had recourse to the doctrine of elements, of which, after the example of Aristotle, and before him Plato in the 'Timæus,' he admits four, and from the mixture of these deduces the secondary qualities. It may be worth while to observe how he employs this hypothesis in his treatise 'De tuendâ Valetudine' (Ed. Johan. Caii, Basil, ap. Froben, 1549), in the explanation of the phenomena of health and disease. The injurious influences to which animal bodies are liable are of two kinds: innate or necessary, and acquired. The former depend upon their original constitution. They are formed of two substances: the blood, which is the material ($\delta\lambda\alpha\gamma$); and the semen, the formative principle. These are composed of the same general elements—"hot, cold, moist, and dry, four champions fierce," or, to express them in their essences instead of their qualities, fire, air, water, and earth. Their differences depend upon the proportions in which these elements enter into their composition. Thus in the semen the fiery and aeriform essences predominate; in the blood, the watery and earthy; and in the blood the hot is superior to the cold, and the moist to dry. The semen again is drier than the blood, but yet upon the whole is of a moist nature; so that in the original formation of the body there is a predominance of the moist principle. After birth therefore there is a necessity for an increase of the dry principle. This is obtained not from the earth itself, but through the medium of fire. From the increasing influence of this principle, the changes which take place in the body during life are to be explained: as, for instance, the softness and flexibility of the limbs in childhood compared with their rigidity in old age. By eating and drinking we obtain a fresh supply of the dry and moist principles. By respiration and the pulsations of the heart a due supply of the cold and hot principles is kept up; but as they cannot be obtained in a fit state for the different uses of the animal economy, organs are necessary to digest, separate, and remove the unsuitable portions.

Health consists in the perfect and harmonious admixture of these various elements; but we must assume, in addition, that the body is free from pain, and that there is no obstacle to the due performance of the functions. From this idea of health we may easily form the conception of disease. It is that state of body in which the functions are in any way interrupted. It depends upon some disproportion in the constituent elements, or some unnatural condition of the organs. The causes of disease are divided by Galen into occasional and predisposing. The predisposing causes are supposed to depend upon some degeneration of the humours. This degeneration was called by him a putrefaction. Thus the quotidian fever is referred to putrefaction of the mucus; tertian, to that of the yellow bile; and quartan, to that of the black bile—this last humour being slow of motion, and requiring a greater time for the completion of the paroxysm. It was upon this theory of the putrefaction of the humours that the practice of physicians was founded for centuries after the death of Galen, and their remedies were directed to the expulsion of the supposed offending matter. Inflammation depends, according to Galen, upon the passage of the blood into those parts which in their normal condition do not contain it. If the blood be accompanied by the spirits, the inflammation is spirituous; if the blood penetrates alone, it is phlegmonous. Erysipelatous inflammation is caused by the admixture of bile; oedematous, by that of mucus; and schirous, by the addition of black bile. The same divisions of inflammation are still retained by systematic writers, but we are content to abstain from referring them to these assumed causes.

The reputation of Galen was established upon the general reception which his theories met with, and his passion for theorising was so great that he has left us but few good descriptions of disease. In these his principal object seems to have been to display his own talent for prognosis. From a character like this we are not to expect much information in the application of particular remedies, but the general principles which he lays down in respect to indications of treatment are worthy of notice. He directs us to draw our indications especially from the nature of the disease; but if this be undiscovered, from the influence of the seasons and the state of the atmosphere, from the constitution of the patient, his manner of living, or his strength, and in some few instances from the accession of the disease. He is said to have occasionally performed surgical operations, but during his stay in Rome he commonly refused to do so, in compliance with the custom of the Roman physicians.

The unbounded influence which the authority of this great and learned physician exercised over the minds of his successors, unquestionably contributed to retard the progress of medicine; for while physicians were occupied in the study of his works, and in vain attempts to reconcile the phenomena of nature with the dicta of their master, they had little time and less inclination to interrogate Nature herself, and pursue the study of medicine in those fields in which alone it can be followed with success.

Galen was a most voluminous writer. Though many of his works are said to have been burnt in his house at Rome, and others in the course of time have been lost, there are still extant 137 treatises and fragments of treatises, of which 82 are considered undoubtedly genuine.

From 30 to 50 treatises are still in manuscript, and 168 are mentioned as the ascertained number of those that are lost. The writings of Galen are valuable, not only for the history of medicine, but the great variety of miscellaneous matter which they contain.

Numerous editions of his works have been published, and several Latin translations, since the discovery of printing. Five Latin editions of the collected works of Galen were published before the Greek text: the first Latin edition is that by Bonardus, Venice, 1490, 2 vols. fol. His '*Historia Philosophica*' was printed by Aldus in 1497, together with some treatises of Aristotle and Theophrastus; and in 1625 the same printer published the first complete edition of the Greek text at Venice in 5 vols. fol., which was edited by And. and Fr. Asulanus, and was dedicated to Clement VII. The text of this edition was by no means correct, but the impressions on large paper are scarce and valuable. An edition was published at Basel, 1562, in 4 vols. fol., with prolegomena, by the naturalist Gesner. His treatises, '*De Methodo Melendi*,' '*De Naturali Facultate*,' '*De Sanitate Tuenda*,' were translated by our countryman Linacre; and an edition of his treatise, '*De Sanitate Tuenda*,' and of some other works, was published by Caius. More recently an edition in Greek and Latin has been published by C. G. Kühn (20 vols. 8vo, Lipsic, 1821-33). Most of the writings of Galen exist also in Arabic, and some in Hebrew translations. The reputation of this great writer was for a long time as unbounded and his authority as absolute among the Arabs as among the physicians of Europe.

GALERIUS. [MAXIMIANUS.]

GALIANI, FERDINANDO, was born at Chieti, in the Abruzzo, in 1728, and studied at Naples, where he first attracted attention by some humorous compositions which he published under an assumed name, to ridicule certain pedantic academicians ('*Componimenti varii per la morte di Domenico Jannaccone carnefice della Gran Corte della Vicaria*,' 1749). In the following year his important work, '*Della Moneta*,' on the 'coin,' or 'currency,' was also published under an assumed name. In this work he established the principle, which was then far from being acknowledged, that money is a merchandise, and that its value and interest ought to be left free like other goods. This work produced a great sensation on the Continent, and especially at Naples, where the government adopted its principles, and left the trade in bullion free. It is generally believed that Bartolommeo Intieri and the Marquis Rinuccini, two Tuscan economists of that time, furnished Galiani, who was then a young man scarcely twenty-one years of age, with their ideas on the subject, which Galiani extended and produced in a readable shape. He published a second edition of this work, thirty years after, in 1780, with additions. In the first book he examines the intrinsic value of the precious metals, independent of their use as currency; in the second he treats of the use of a metallic currency as a medium of exchange; and in the third he discusses the relative value of the three metals used for coin, the conventional value of the coined currency of a country in relation to the prices of goods, and the occasional expedient adopted by some governments to raise the value of the currency.

In 1759 Galiani was sent to Paris as secretary of legation, and his vivacity, wit, and repartee rendered him a favourite among the fashionable and literary coteries of that capital. He remained in Paris several years, visited England and Holland, and on his return to France wrote his '*Dialogues sur le Commerce des Blés*,' which was his second work on political economy. He did not publish this essay himself, but left the manuscript in the hands of Diderot, who had it printed in 1770. The French economists were then divided into two parties, one of which advocated a free trade in corn, and the other was opposed to it. An edict, published in 1764, permitting the free exportation of corn, was followed by a rise of prices and a scarcity, which by some were considered as the effects of that measure, whilst others denied the inference. Galiani supported neither of the two systems absolutely: he contended that the laws concerning the corn-trade must vary according to the situation of various states, the nature and cultivation of the respective soils, the relative position of their corn districts or provinces, and also the form of their governments. In a letter to Suard, dated 1770, he explains himself more clearly on this last topic, saying, "that under a despotic government a free exportation of corn might prove dangerous, as it might be followed by a famine, which would rouse the people against its rulers; that in a democracy the same freedom is a natural result of the political institutions; whilst in mixed and temperate governments the freedom of the corn-trade must be modified by circumstances."

On his return to Naples, Galiani was appointed by the king to the Board of Trade, and afterwards to the Board of Finances, and to the superintendence of the crown domains. His health, naturally weak, suffered from constant application, and he died in October 1787, at the age of fifty-nine years. He left in manuscript a commentary or series of disquisitions on the life and character of Horace and the spirit of his poems, extracts from which are found in the '*Correspondence de Galiani avec Mademoiselle d'Epinau*,' Paris, 1818; in the notes to the '*Traduzione d'Orazio di T. Gargallo*,' Naples, 1820; in the

'*Vita dell' abate Ferdinando Galiani, scritta da Luigi Diodati*,' Naples, 1788; and in the '*Mélanges de l'abbé Suard, tirés de la Gazette littéraire d'Europe*;' see also Ugoni, '*Della Letteratura Italiana*,' vol. ii., art. 'Galiani.'

* GALIANO, ANTONIO ALCALA, one of the most eminent of modern Spanish authors and politicians, was born at Cadix on the 22nd of July 1789. His father, Don Dionisio Aloah Galiano, a distinguished naval officer, was sent in 1792 in command of an expedition from Lima to discover a northern passage from the Pacific to the Atlantic, and published an account of the voyage, '*Relacion del Viaje hecho por las goletas Sutil y Mexicana*,' which has been often referred to since recent events have drawn attention to the coasts of California and Oregon. Antonio, who at the age of seven was made a cadet of the royal Spanish guards, accompanied his father on a voyage to Naples to fetch the Neapolitan bride of the Prince of the Asturias, afterwards Ferdinand VII., and became passionately fond of the sea, but his father would not listen to his desire to enter the service. Don Dionisio fell by a cannon-ball at the battle of Trafalgar, when his son was of the age of sixteen. The boy had from his earliest years been remarkably liberal in his opinions, but three years after, when the invasion of Spain by Napoleon took place, he joined with ardour the cause of independence, and took refuge in Cadiz, where he soon began to show his talents as a writer on political subjects. His maternal uncle was at that time one of the regency, but Galiano, thinking the regency too deferential to the Duke of Wellington and the English, assailed them in an article which, among other consequences, seems to have had that of causing him to lose his appointment to a post in the embassy at London. He went to Sweden instead, from which he returned in 1814, and was so indignant at the turn affairs had taken in the re-establishment of Ferdinand VII., that he became an active conspirator against the government, and had a large share in the revolt of the Isle of Leon, which established the constitution of 1820. Elected a member of the Cortes, he became the principal orator of the liberal party, and displayed extraordinary powers of fervid eloquence. It was he who proposed the answer returned by the Spanish ministry to the Congress of Verona, and the suspension of the king from his authority. On the triumph of the French invasion under the Duke of Angoulême, he was of course compelled to seek safety in flight, and took refuge in England, where he resided for the seven years from 1823 to 1830. He learned to speak the English language well, and to write it still better; and was indebted for much of his support to the articles he wrote in the English reviews, particularly the '*Westminster*' and the '*Foreign Quarterly*.' On the establishment of the London University he was appointed the first professor of the Spanish language and literature, and his introductory lecture, delivered on the 15th of November 1828, was admired for its matter, its composition, and its delivery.

His most important production in English is however his '*History of Spanish Literature in the 19th Century*,' published in the '*Athenæum*' for 1834, which is decidedly superior in many respects to everything else that has been written on the subject, and which it is to be much regretted has not made its appearance in a separate form. Before its publication, Galiano had left England, having, on the occurrence of the French Revolution of 1830, thrown up his professorship, and gone first to Paris and then to Tours, in the hope that new projects were opening for Spain. He was disappointed in his hopes of an outbreak, and while King Ferdinand lived his name was expressly excepted from every amnesty. In 1834 he was at last, in the ministry of Martinez de la Rosa, allowed to enter Spain. He soon resumed his former eminence as a political writer and a speaker in the Cortes, and in 1835 was thrown into prison by the then minister, Toreno, because an insurrection of the force called the urban militia had taken place, with which he stood in no kind of connection, but which was in support of the principles he advanced in the Cortes. He hurt his influence soon after by forsaking the Mendisabal ministry which he had supported, and allying himself with Mendisabal's opponent, Isturiz, in conjunction with whom he came into power, and in conjunction with whom he was overthrown by the strange revolution of La Granja. Two years and three months after he had entered Spain from France as an exile who had suffered for liberal opinions, he made his escape into France from Spain, with his life threatened as the member of an anti-liberal ministry. The new government of Madrid, by an extra-judicial proceeding, condemned him with Toreno and others to the loss of his employments and the sequestration of his property, but in the same year he, with Toreno, returned to the Cortes and again took part in political affairs. In 1840 he had once more to fly for his life in consequence of an insurrection at Barcelona, and in 1842 he was again in London, where he published a pamphlet in English, entitled '*An Appeal to the Good Sense of the British Nation in favour of the moderate Spanish liberals*,' by a Spaniard. By this time however he had fallen into discredit as a politician, from doubts both as to his consistency and his courage, and his friends were not displeased to see him devote himself more closely to a literary career. One of his most important literary productions was a translation into Spanish of Dr. Dunham's '*History of Spain*,' originally published in '*Lardner's Cabinet Cyclopaedia*,' in which Galiano was assisted with introductory and other matter by his friends Donoso Cortes and Martinez de la Rosa. He has also translated Thiers' '*History of the*

Consulate and the Empire,' and of late years his name has been little heard of in connection with politics. Galileo has been twice married. His first marriage, which took place at the age of nineteen, was very unfortunate, and exercised a prejudicial influence on part of his early career.

GALILEI VINCENTIO, a noble Florentine, and father of the illustrious Galileo Galilei, was born in the early half of the sixteenth century, and studied music under Zarlino, though he did not hesitate to attack the opinions of his master, in a 'Discorso intorno all' Opere del Zarlino,' and afterwards in his great work, the 'Dialogo della Musica antica e moderna,' a folio volume, printed at Florence in 1581. This work, which displays vast erudition and laborious research, has afforded much assistance to the musical historians of later days; but the author occasionally betrays a hardness in assertion, of which his more philosophic son was never guilty. He was an exquisite performer on the lute, an instrument, he tells us, that was better manufactured in England than in any other part of Europe. He was a rigid Aristoxenian, and his prejudices in favour of the ancients were strong; nevertheless his 'Dialogo' is well worth the notice of the curious inquirer into musical history.

GALILEI GALILEO, who is most commonly known under the latter, which was his Christian name, was the son of Vincentio Galilei. He was born at Pisa, in Tuscany, on the 15th of February 1564.

Having acquired, during his boyhood, and under adverse circumstances, the rudiments of classical and polite literature, he was placed by his father at the University of Pisa in his nineteenth year. Galilei was designed for the medical profession, but that genius for experiment and demonstration, of which he exhibited the symptoms in his earlier youth, having found a more ample scope in the university under the kind auspices of Guido Ubaldo, with whom he had become acquainted through his first essay on the Hydrostatic Balance, he determined to renounce the study of medicine and pursue geometry and experimental philosophy. This resolution, to which his father reluctantly agreed, was highly approved by those who had witnessed his extraordinary talents, and was perseveringly followed up by him through the rest of his life.

His first important discovery was the isochronism of the vibrations of a simple pendulum sustained by a fixed point. This property is not rigorously true where the arcs of oscillation are considerable and unequal, nor does Galilei ever seem to have adopted any contrivance similar to a fly-wheel, by which these arcs may be rendered equal. His knowledge too of the force of gravity, of the decomposition of forces, and of atmospheric resistance, was too imperfect to conduct him to any valuable improvement of the instrument, and hence the fair claims of his successor, Huyghens, so well supported by his treatise 'De Horologio Oscillatorio,' cannot with any justice be transferred to Galilei, whose merits are sufficiently abundant and conspicuous to need no borrowed attributes. This equality or near equality of the time of vibrations Galilei recognised by counting the corresponding number of his own pulsations, and having thus perceived that the pendulum oscillated more slowly or rapidly according to its less or greater length, he immediately applied it to the medical purpose of discovering the state of the pulse; and the practice was adopted by many Italian physicians for a considerable time.

Through the good offices of Ubaldo, who admired his talents and foresaw their future development, Galilei became introduced to the grand-duke Ferdinand I. de' Medici, who appointed him mathematical lecturer at Pisa (1589), though at an inconsiderable salary. Here he commenced a series of experiments on motion, which however were not published until long after, and then only a scanty portion. This circumstance is probably not much to be regretted, since his inferences on the relation of velocity to space were incorrect at first; but he had learned enough from his experimental course to perceive that most of the scholastic assumed laws of motion were untenable.

The mind of Galilei becoming thus unfettered from the chain of authority, he resolved to examine the rival systems of astronomy—the Ptolemaic, with its cumbrous machinery of cycles and epicycles, eccentrics and primum mobile, and the Copernican, which, from its simplicity and gradually-discovered accordance with phenomena, was silently gaining proselytes amongst the ablest observers and mathematicians. He soon discovered and proved the futile nature of the objections then usually made against it, which were founded on a complete ignorance of the laws of mechanics, or on some misapplied quotations from Aristotle, the Bible, and the Fathers; and having also observed, that many who had at first believed the former system, had changed in favour of the latter, while none of those attached to the latter changed to the Ptolemaic hypothesis—that the former required almost daily some new emendation, some additional crystalline sphere, to accommodate itself to the varying aspects of the celestial phenomena—that the appearance and disappearance of new stars contradicted the pretended incorruptibility of the heavenly bodies, together with other reflections which he has collected in his dialogues,—he became a convert to the Copernican system, and in his old age its most conspicuous martyr. So strong however were the religious prejudices on the subject of the quiescence of the earth, that Galilei thought it prudent to continue to lecture on the hypothesis of Ptolemy, until time should afford a favourable opportunity to destroy the visionary fabric by incontestable facts.

One of the false doctrines which he first combated was that bodies of unequal weights would fall through the same altitude in unequal times: thus, if one body were ten times as heavy as another, it should fall through 100 yards while the lighter had only fallen through ten. But though the experiment was performed from the leaning tower at Pisa, and both bodies reached the ground at almost the same instant (the small difference, as Galilei rightly observed, being attributable to the unequal resistances of the air), the witnesses of this experiment were not convinced, so inveterately were they prejudiced in favour of the doctrines in which they had been taught to place implicit belief.

Instead of making converts by his experiments, Galilei discovered that he had made many secret and some open enemies; he therefore left Pisa and removed to the university of Padua (1592), where he was appointed to a professor's chair for the limited period of six years. Here he invented an imperfect species of thermometer, depending on the expansion of the air which remained after a portion was expelled by heat from a narrow glass tube, which was then inverted and immersed in water. His correspondence with Kepler commenced about the same period, and continued with the greatest mutual friendship and regard until his death. A treatise on the 'Sphere,' after the Ptolemaic system, which is attributed to Galilei, appeared about the same time. (Afterwards published at Rome, 1665.)

On his reappointment to the professorship at Padua his salary was doubled, his fame increased, and his lectures were crowded; but these flattering events were overbalanced by a disagreeable intermittent disease to which he then first became subject, and which pursued him for the remainder of his life. A new star, almost as brilliant as that which directed Tycho Brahe's mind to the study of astronomy, having appeared in 1604, in the constellation of Ophiuchus, he made it the subject of his lectures, which it may be presumed were less explanatory of its cause, than intended as an attack upon the Ptolemaic system. The conjecture now most generally adopted relative to these remarkable phenomena is, that luminosity is not essential to the central body or sun of a planetary system, consequently the star may be quite opaque or partially luminous, and therefore would be either absolutely invisible or only seen when the luminous portion was in the line joining the earth and star: this explanation is sufficient for those which appear and disappear with regularity; in other cases this transitory phenomenon may merely indicate an epoch of change in the cosmogony of the peculiar system of the star.

Astronomy did not however engross all the attention of Galilei. He read and admired Gilbert's work, 'On the Nature of Bodies,' and adopted his views on the subject of terrestrial gravity, and constructed magnets after his example; about the same time he attacked with some bitterness one Capra, who ascribed to himself the invention of a species of compass which Galilei had made; and he wrote also on practical methods for the measurement of heights and distances. Shortly afterwards he states in a letter, that "he intended hereafter to write three books on the system of the universe; three books on local motion; three books of mechanics; also on sound, speech, light, the tides, continuous quantity, animal motion, and castrametation; many of which, it is supposed, were destroyed by his relatives after his death, at the instance of the family confessor.

The year 1609 was signalised by the construction of the Galilean telescope, which consisted of a plano-convex object-glass, and a plano-concave eye-glass, and thus he laid the foundation of the brilliant discoveries in the solar system, which have rendered that science the most perfect of which the objects are the most remote. It is true that Jansen, a Dutch optician, and some others previous to him, had constructed microscopes, and perhaps imperfect telescopes, but they cannot claim the invention of the astronomical telescope, their articles having been more intended for toys and puerile amusement than any valuable practical purpose; and as they had no notion of applying them to the heavenly bodies, it is obvious that their random constructions would be totally inapplicable to such a purpose. However the long-mooted question of the invention of this noble instrument of science may be decided, its application by Galilei to astronomy, for the first time, is indisputable. His first telescope was presented to the Doge of Venice, by whom the professorship at Padua was confirmed to him for life, with the greatest salary which had ever been there given to the mathematical professor, namely about 1000 florins.

Galilei, impatient to obtain ocular evidence of what he called the "structure of the universe," soon provided himself with a second instrument, and on directing it towards the moon, this luminary became immediately stripped of the character of geometrical perfection, absurdly attributed to all the celestial bodies by the schoolmen, according to whom they were all perfectly round, self-luminous, and uncorrupted by any terrestrial tarnish.

The more obscure parts of the lunar surface, which they imagined had arisen from some earthly taint consequent on the proximity of the moon, being now rendered distinctly visible, taught Galilei that the surface of the moon was irregular and uneven, having mountains and valleys of much greater extent, in proportion, than those on our globe; the faint light on the darkened portion of the moon's surface he recognised to be the reflection of the sun's rays from the earth; the luminous isolated points near her inner border, and the jagged

outline of that border, showed the great inequalities on her surface, since the mountain-tops would be illuminated by the sun, while the sides and base would lie in obscurity, in consequence of the convexity of the surface. In pursuing these observations, he found that the moon turns towards the earth the same face constantly, so that nearly a hemisphere of her surface can never be visible to us. From this remarkable fact he does not appear to have drawn the inevitable consequence, that the time of her rotation round her own axis, and the time of a revolution round the earth, must be exactly equal. Lagrange afterwards suggested that this effect was primitively caused by the determination of the lunar figure, in which the heavier part being originally accumulated towards the attracting primary, the moon, in its revolution, would always have a tendency to fall towards the heavier side so determined. Galilei subsequently observed the librations of the moon, by which small portions of her more distant hemisphere are alternately brought in view; but he was not in a situation to give a satisfactory explanation of the cause, from the imperfection of theoretical astronomy. The idea which was suggested from the appearance of oceans and continents, mountains and valleys, on the moon, that she might be habitable, overwhelmed the schoolmen with horror, and struck the religious with alarm.

On examining the nebulae, and particularly the Milky Way, with his glass, he perceived that they were composed of myriads of stars, or, in the language of Milton, "powdered with stars." It may be remarked in passing, that Milton visited Galilei, and entertained the highest opinion of his philosophy, to which he makes several beautiful allusions in his 'Paradise Lost.'

The planet Jupiter furnished matter for still greater wonder. Galilei perceived three very small stars eastward of the planet, and close to its disc; two of them, on a subsequent observation, had distinctly changed position to the westward: he soon perceived that they were satellites; and shortly afterwards he discovered the fourth. The strength which this discovery gave to the Copernican system, from the analogy with our moon, however gratifying to Galilei in a speculative point of view, did not prevent his ever-active mind from perceiving its great practical importance in the question of determining longitudes at sea; but it was reserved for a future age to bring this and other methods to a degree of perfection then impracticable. The theory of astronomy and the construction of chronometers were, at that time, in a most imperfect state; and though Galilei offered his services to Spain, then a great maritime power, it is doubtful whether he would not have had cause for regret if the wished-for arrangement had taken place. The manner in which he was assailed after this discovery must have caused him amusement rather than chagrin: some would not look through his glass to be convinced; one Horky asserted that he had used the telescope, and that he saw nothing of the kind; one thought it odd that nature should give satellites to Jupiter for no purpose but to immortalise the Medici family (for Galilei had denominated them Medicæan stars, in honour of his patron). Some time after, his opponents found out five satellites for Jupiter instead of four; while one had the impudence to say that he actually saw nine satellites. (1610.)

On examining Saturn with the telescope he perceived his ring, or rather rings (as Sir W. Herschel has since shown), but viewing it in perspective, he took the lateral portions for two small stars, which induced him to announce in transposed letters the following sentence—

"Altitissimum Planetam tergeminum observavi."
(The most distant planet I have observed to be threefold.)

Huyghens was the first who corrected this error; though it is remarkable that the occasional disappearance of the supposed lateral planets, which arose from the relative change of the position of the ring, which so much astonished Galilei, had not suggested to him the correct nature of the phenomenon: we must however remember the great imperfections of the first-constructed telescopes.

His next discovery he also concealed in the same enigmatical manner: the transposed letters signify, in their proper order—

"Cynthia figuræ æmulator mater amorum;"
(Venus rivals the moon's phases;)

alluding to the crescent form of this planet when in or near conjunction. His discovery of spots on the sun's disc, which were evidently attached to that luminary, was a severe blow to the imaginary perfection of the schoolmen.

The Jesuits had always entertained a cordial hatred for Galilei, as he had joined the party by whom they had been expelled from Padua; the progress of his discoveries was therefore reported to the Inquisition at Rome as dangerous to religion, and he was openly denounced from the pulpit by Caccini, a friar. In his own justification he wrote letters, one to his pupil Castelli, and another to the Archduchess Christina, in which he repudiates any attack upon religion, and states that the object of the Scriptures was to teach men the way of salvation, and not to instruct them in astronomy, for the acquiring of which they were endowed with sufficient natural faculties. Nevertheless the Inquisition was implacable, and ordered Caccini to draw up depositions against Galilei; but his appearance in person at Rome in 1615, and his able defence of his conduct, for a moment silenced his persecutors.

In March 1616 the pope (Paul V.) granted Galilei an audience, and

assured him of his personal safety, but positively required him not to teach the Copernican doctrine of the motion of the earth: Galilei complied, and left Rome in disgust. He had soon occasion to turn his attention again to astronomy, for in 1618 there appeared no less than three comets, on which occurrence Galilei advised his friends not to conceive too hastily that comets are like planets, moving through the immensity of space, but that they may be atmospheric; his reasons for this, though ingenious, are fallacious, as are those which he afterwards gave for the causes which produce tides, which he attributes to the unequal velocities of different parts of the sea by reason of the combination of the rotatory and progressive motions of the earth, which at some points conspire together and at others are opposed. Wallis afterwards seems to have adopted the same opinion, which could never have been entertained had either of them reflected on the complete independence of the rotatory and progressive motions of bodies. The motion of the whole solar system too would, on their supposition, have affected the tides; but dynamics had as yet no existence, and Galilei often frankly confesses that he is more a philosopher than a mathematician. He afterwards went to Rome, and was received with great kindness by the next pope (Urban VIII.): his enemies were silenced for awhile, and he was sent home to Tuscany loaded with favours and presents; and though his patron, Cosmo II. de' Medici, was dead, his successor, Ferdinand II., showed him strong marks of esteem and attachment.

In 1630 he finished, and in 1632 completed, his celebrated work, 'Dialogue on the Ptolemaic and Copernican Systems,' which he dedicated to Ferdinand II. By giving the work this form, his object seems to have been to evade his promise not to teach the Copernican doctrine. Three fictitious persons conduct the dialogue: Salviati, a Copernican; Sagredo, a banterer on the same side; and Simplicio, a Ptolemaist, who gets much the worst both by jokes and arguments. In his dialogue Galilei was thought to have aimed at the prohibition in some of his sarcastic remarks; and the pope, who had been personally friendly with Galilei, fancied, apparently with some reason, that he was the person held up to ridicule in the last character, as some arguments which he had used had been put into Simplicio's mouth; he was therefore mortally offended, and the Inquisition resolved not to allow the attempted evasion of Galilei's solemn promise. Galilei was accordingly summoned to Rome, though he was seventy years of age and overwhelmed with infirmities; he had however all the protection and comforts which the grand duke could confer on him, being kept at the Tuscan ambassador's house; and this spirited man (Nicolini) even wished to maintain him at his own expense when he perceived a penurious disposition in Ferdinand's minister.

After some months' residence in Rome he was again summoned before the Inquisition, and on the 20th of June appeared before the assembled inquisitors in the convent of Minerva. The whole of his sentence is too long to be transcribed here, but a portion of it is too curious to be omitted:—

"By the desire of his Holiness, and of the most eminent Lords Cardinals of this supreme and universal Inquisition, the two propositions, of the stability of the sun and motion of the earth, were qualified by the Theological Qualifiers as follows:—

"1st. The proposition that the sun is the centre of the world and immovable from its place, is absurd, philosophically false, and formally heretical; because it is expressly contrary to Holy Scripture.

"2ndly. The proposition that the earth is not the centre of the world, nor immovable, but that it moves, and also with a diurnal motion, is absurd, philosophically false, and theologically considered at least erroneous in faith."

After a long and declamatory exposé, from one passage in which it has been suspected that Galilei was put to the torture, it concludes thus:—

"We decree that the book of the 'Dialogues' of Galileo Galilei be prohibited by edict; we condemn you to the prison of this office during pleasure; we order you, for the next three weeks, to recite once a week the seven penitential psalms, &c. &c."

To obtain so mild a sentence Galilei was obliged to abjure, on the Gospels, his belief in the Copernican doctrine. We quote a part of his abjuration:—

"With a sincere heart and unfeigned faith I abjure, curse, and detest the said errors and heresies (viz. that the earth moves, &c.); I swear that I will never in future say or assert anything, verbally or in writing, which may give rise to a similar suspicion against me. . . .

"I Galileo Galilei have abjured as above
with my own hand."

Rising from his knees after this solemnity, he whispered to a friend, "E pur se muove" ("It moves, for all that").

This sentence and abjuration having been generally promulgated, the disciples of Galilei found it necessary to act with prudence; but their esteem for their master was not diminished by this compulsory abjuration.

Afflictions followed quickly the old age of Galilei. In April 1634 he lost a beloved daughter, who was his only stay. He was allowed to return to Arcetri, where she breathed her last, but he was still kept in strict confinement. After two years spent in this unhappy condition, his confinement became more rigorous through some new suspicions entertained by the pope; so that, after having been allowed

to remove to Florence for the benefit of his declining health, he was ordered to return to Arcetri. In 1636 he became totally blind, about which time he finished his 'Dialogues on Motion,' which were remarkable enough for the time or for any other man, though not perhaps commensurate with the high ideas associated with the name of Galilei; and though he believed this work could not annoy the holy office, yet the terror was so great and universal that he could not get it published until some years after, when it was undertaken at Amsterdam.

Amongst the most celebrated pupils of Galilei are Viviani and Torricelli, the former of whom in particular bore a strong attachment for his master. While Torricelli was arranging a continuation for the 'Dialogues on Motion,' Galilei was suddenly taken ill with a palpitation of the heart, and, having lingered two months, he died on the 8th of January 1642.

Galilei appears to have been of a sprightly temperament, easily crossed and easily reconciled; his kindness to his relatives, which distinguished him from his childhood to old age, and which went frequently to such an extent as to embarrass himself, forms a noble trait in his domestic character; he was somewhat attached to the bottle, and was considered a good judge of wine; he contrived to have his son Vincentio legitimated, but afterwards had the misfortune to find his hopes in this lad rather disappointed. Galilei was also acknowledged to have an excellent taste for music, painting, and poetry, and the style of his 'Dialogues' is still much praised by his countrymen.

Galilei's works have been collected in 13 vols. 8vo, Milan, 1811; there have been also several other collections of the same, and they have been published in separate tracts.

Viviani, his disciple, wrote his life, and left a legacy to raise a monument to his memory. Newton was born one year after Galilei's death.

One of the best-written biographies of Galilei that has yet appeared is by Mr. Drinkwater, in the 'Library of Useful Knowledge.' A learned and elaborate, though not very temperate, defence of the proceedings of the Roman Catholic Church, was published in the 'Dublin Review' for July 1838.

GALL, DR. FRANZ JOSEPH, the founder of the system of phrenology, was born at Tiefenbrunn, in Suabia, on the 9th of March 1757. If the story told of him be true, he, at a very early age, evinced habits of accurate observation; for it is said that, when a boy at school, he amused himself with remarking the differences of character and talent among his brothers and sisters, his playmates and schoolfellows; and he soon arrived at the conclusion that these characters and talents seldom changed by education. He observed, it is said, that the boys who were his most formidable competitors were all distinguishable by a peculiar expression of countenance, the result of unusual protrusion of the eyeball, which seemed to him a certain sign of talent. On his removal to another school he still found himself invariably beaten by his "bull-eyed" companions, as he called them, and making the same observations as before, he found all his playmates still distinguished for some peculiar talent or temper. He next went to the university of Vienna to pursue his studies for the medical profession, and at once began to search for prominent eyes among his fellow-students; all that he met with were, as he found, well known for their attainments in classics, or languages generally, or for powers of recitation; in short, for talent in language; and hence the prominent eye, which he had first thought indicated talent generally, he became convinced marked a facility for acquiring a knowledge in words, which was the principal study in the schools of his boyhood. This coincidence of a peculiar talent with an external physiognomic sign, led him to suspect that there might be found some other mark for each talent, and remembering that at school there were a number of boys who had a singular facility in finding birds' nests, and recollecting where they had been placed, while others, and especially himself, would forget the spot in a day or two, he began to search among his fellow-students for all who indicated a similar knowledge and memory of places, that he might see in what feature that would be indicated, and he soon thought he found them all marked by a peculiar form of the eye-brow. He now felt convinced that by accurate observation of the shape of the head in different persons, he should find a mark for every kind of talent, and he lost no opportunity of examining the forms of the head in poets, painters, mechanics, musicians, and all distinguished in art or science. He found, as he fancied, external signs in each class that separated them from the rest, and he thought he could now clearly discern the character of each by their cranial formation before he inquired into their pursuits or reputation. He had observed that persons remarkable for determination of character had one part of their heads unusually large, and he was therefore led to seek whether there were not signs of the moral affections similar to those which he believed he had discovered to indicate the intellectual powers. After some time he imagined that these affections also might be ascertained by discerning how far one portion of the head surpassed the others in size. His mind was now completely engrossed with the pursuit of facts to support his belief that he should find a complete key to the human character, and his academic career was marked by no particular success.

To further his pursuit, he resorted to the works of the most esteemed metaphysicians of ancient and modern days, but here he found nothing that at all favoured the view which he had been led to take of the

human mind. He therefore gave them up, and resorted again to observation alone, and he now extended his field. Being on terms of intimacy with Dr. Nord, physician to a lunatic asylum in Vienna, he carefully examined all the insane there, observing the peculiar character of the insanity in each, and the corresponding forms of their heads: he frequented prisons and courts of justice, and made notes of the crimes and appearance of all the prisoners. In short, wherever there was any person made remarkable by good or bad qualities, by ignorance, or by talent, Dr. Gall lost no opportunity of making him a subject of his study. With the same views he was constant in his study of the heads and characters of both wild and domesticated animals. He had always felt sure, that the form of the skull in itself alone could stand in no relation to the intellect or disposition, but it was not till late in his pursuit that he resorted to anatomy to confirm his views. Having obtained his diploma, he made it his care, as far as possible, to ask for leave to examine the brains of all whose characters and heads he had studied during life, and satisfied himself that, as a general rule, the exterior of the skull corresponds in form with the brain contained within it.

At length, after upwards of twenty years exertion and study, Dr. Gall delivered his first course of lectures, in 1796, at his house in Vienna. Supported by a vast accumulation of facts, he endeavoured to prove that the brain was the organ on which all external manifestations of the mind depended; that different portions of the brain were devoted to particular intellectual faculties or moral affections; that, *cæteris paribus*, these were developed in a degree proportioned to the size of the part on which they depended; and that, the external surface of the skull corresponding in form with the surface of the brain, the character of each individual was clearly discernible by an examination of his head.

A doctrine so new, and so subversive of all that had been previously taught in psychology, produced no little excitement. To some the number of simple facts, the apparently clear and necessary deductions from them, and the ease with which the new system seemed to lead to the knowledge of a science hitherto so obscure, were sufficient to secure at once their assent, while others said that Gall, beginning with a theory, had found at will facts to support it; that a plurality of powers in the same organ was too absurd to be imagined, and that the doctrine, leading on the one hand to fatalism, on the other to materialism, would, if received, be subversive of all the bonds of society, and opposed to the truths of religion. It was argued with all the ardour with which new doctrines are so generally assailed and defended, but Gall took little part in these disputes, and still continued to lecture and collect more facts.

He gained disciples daily, and in 1800 Dr. Spurzheim became his pupil. In 1804 this gentleman was associated with him in the study of his theory, and to this event phrenology probably owes much of its present clearness and popularity. Spurzheim possessed a mind peculiarly adapted for generalising facts, of which phrenology at that time almost entirely consisted, and besides being most ardent and industrious in the pursuit of additional support for the doctrines, he had much suavity of manner and power of conversation.

Soon after their association, Drs. Gall and Spurzheim commenced a tour through the principal towns in Germany and Switzerland, diffusing their doctrines, and collecting everywhere with assiduous industry fresh evidence in their favour. In 1807 they arrived at Paris, which became at once the field of their principal labours, and of the most vehement discussion. It attracted the attention of Napoleon, who at first is said to have spoken in no measured terms of the savans of his country for "suffering themselves to be taught chemistry by an Englishman (Sir H. Davy), and anatomy by a German." He afterwards however expressed his disbelief in it, and hence the reason (say the most ardent supporters of the doctrine, why in 1809 the commission appointed by the Institute on the 'Mémoire' presented by Gall and Spurzheim, in March 1803, returned a report highly unfavourable both to phrenology and its author. Undaunted however by this severe check to their rising popularity, they continued to study and to teach both by lectures and by voluminous publications till 1813, when a dispute arising, partly as to the degree of credit which each merited for the condition at which phrenology had then arrived, partly from private motives, they separated. Dr. Gall remained in Paris; Dr. Spurzheim soon after proceeded to England.

Dr. Gall continued in Paris till his death, which occurred on the 22nd of August 1823. He had suffered for nearly two years previously from enlargement of the heart, which prevented him, except at intervals, from pursuing his lectures, and at length produced a slight attack of paralysis, from which he never recovered. At the post-mortem examination his skull was found to be of at least twice the usual thickness, and there was a small tumour in the cerebellum: a fact of some interest, from that being the portion of the brain in which he had placed the organ of amativeness, a propensity which had always been very strongly marked in him.

Whatever may be the merits of the phrenological system, Dr. Gall must always be looked upon as one of the remarkable men of his age. The leading features of his mind were originality and independence of thought, a habit of observation, and invincible perseverance and industry. Nothing perhaps but a character like this in its founder, and the very popular and fascinating manners of his chief supporter,

could have upheld the doctrine of phrenology against the strong tide of rational opposition and ridicule with which it was assailed. Whether the system be received or not, it will be granted that both in the collection of psychological facts which they had formed, and have published, and by the contributions which they have made to the study of the structure of the brain, to which their later labours had been particularly directed, they have conferred very great benefits on medical science. The character of Dr. Gall's writings is vivid and powerful; his descriptions, though slight, are accurate and striking; but his works are too voluminous to be acceptable to the majority of readers, and have therefore in this country been almost entirely superseded by those of Dr. Spurzheim, to which however in substantial value they are far superior. They comprise—'Philosophisch-Medicinische Untersuchungen über Natur und Kunst im Kranken, und Gesunden Zustande des Menschen,' 8vo, Leipzig, 1800; 'Anatomie et Physiologie du Système Nerveux en général, et du Cerveau en particulier: Mémoire présenté à l'Institut, Mars, 1808;' and under the same title his great work in 4 vols. 4to, and atlas folio, published in Paris, from 1810 to 1819, of which the first and half the second volume were written in conjunction with Dr. Spurzheim; and 'Sur l'Origine des qualités morales et des Facultés intellectuelles de l'Homme,' 6 vols. 8vo, Paris, 1825.

GALLAUDET, REV. THOMAS HOPKINS, to whom America is indebted for the introduction of instruction for the deaf and dumb, was born at Philadelphia, December 10, 1787. Having passed through Yale College, he commenced the study of the law, but being forced to abandon it, in consequence of ill-health, engaged for awhile in commercial pursuits; then, in 1814, entered the theological seminary at Andover, and upon being licensed to preach, was chosen pastor of a congregational church at Portsmouth, New Hampshire. While thus occupied he became much interested in a little deaf and dumb girl, Alice Cogswell, the daughter of a friend, and he was induced to attempt to instruct her. In this he was by great patience very successful, and her father, Dr. Cogswell of Hartford, was incited by the great benefit which his child had derived, to earnest efforts to extend the blessings of education to other children suffering under a similar deprivation. An association was formed, and funds being provided, a requisition was made to Mr. Gallaudet to resign his ministry, and proceed to Europe for the purpose of learning the system and organization of the existing deaf and dumb institutions.

After some hesitation, caused by a reluctance to separate from his flock, he accepted the offer, and in May 1815 embarked on his mission. He first addressed himself to the London Deaf and Dumb Asylum, but after considerable correspondence he was refused admission to the asylum, except as ordinary junior assistant, and to perform the usual drudgery of that class of assistants. As this he found would have obliged him to spend at least three years in the school, without any corresponding gain, he proceeded to Edinburgh, where there was an asylum in considerable reputation. But there, while the committee and master showed every sympathy with him, and would have been glad to assist him in his excellent object, there was an obstacle which it was found impossible to surmount. The teacher had learnt his system from the Messrs. Braidwood [BRAIDWOOD, THOMAS], and had been compelled by them to sign an engagement not to impart the method to any other person intending to become a teacher.

Thus baffled, Gallaudet was compelled to try Paris. Here he met from the Abbé Sicard a warm welcome. Everything was laid freely open to him, and every means that could be devised was used to accelerate his acquisition of the desired knowledge. He was able to return to America before the close of 1816, and the Abbé Sicard cheerfully consented to Lawrence Le Clerc, himself a deaf-mute, who had been one of the pupils, and was then one of the most valued teachers of the institution (he had indeed been already designated its 'glory and support'), accompanying him to America. During his absence in Europe, the society had been incorporated; Mr. Gallaudet was now appointed its principal, Le Clerc being his head assistant, and on the 15th of April 1817, 'The American Asylum for the Deaf and Dumb,' at Hartford, Connecticut, was formally opened.

Mr. Gallaudet remained the active head of the asylum until 1830, when he resigned from failing health. His devotion to his duties had been most exemplary, and his success as a teacher we are told was "uniform and pre-eminent." The system which he in conjunction with Mr. Le Clerc ultimately established, and which has been adopted in the other asylums (of which there are now fourteen) in the United States, was founded on that of the Abbé Sicard, but with very considerable modifications. It is known as the American system. The main principle with Mr. Gallaudet was to call out the intelligence of the pupil as much as possible, by exercising him in describing things for himself, and to discourage the mere learning by rote; and the result was to stimulate the mind of the teacher, as well as of the pupil, in no ordinary degree.

Mr. Gallaudet's exertions were by no means confined to the deaf and dumb asylum. He took an ardent and active interest in the improvement and extension of common schools, and in the raising up of a superior body of teachers, and wrote several pamphlets on the subject. He also zealously advocated the adoption of means of imparting moral and religious training to prisoners; and he was an earnest promoter of the movement for improving the management of

the insane. So strongly did he feel on this matter that, though in but feeble health, he accepted in 1833 the office of chaplain of the State 'Retreat for the Insane,' at Hartford; where, it is stated, "the experience of each successive year furnished accumulating evidence of the usefulness of his labours, and the efficacy of kind moral treatment, and a wise religious influence in the melioration and care of the insane."

He died on the 10th of September 1851. About twelve months before his death, the good old man, and his colleague Mr. Le Clerc, had the gratification of receiving from the deaf-mutes in America, as a testimonial of their gratitude, a service of plate each; and on the death of Gallaudet, his fellow-citizens proposed to erect a monument to his memory, as a mark of their sense of his services; but as soon as their intention became known, the deaf and dumb urged their superior claim to the performance of that duty, and accordingly a handsome and costly monument was erected to his memory at Hartford, at the "sole expense of the deaf-mutes of the United States;" the designer and the architect of the monument being both deaf and dumb persons.

The publications of Mr. Gallaudet are numerous, but chiefly pamphlets on the education of the deaf and dumb, and on other educational matters; lesson books; and articles in educational journals. But he also published a volume of sermons, and some books for the young, one of which, 'The Child's Book of the Soul,' had an extended popularity both in America and England, and was translated into French, Spanish, Italian, and German.

(Bernard, *Tribute to Gallaudet*, 8vo, Hartford, U.S., 1852.)

GALLIENUS, PUBLIUS LICINIUS, son of the Emperor Valerianus, was made Cæsar and colleague to his father A.D. 253. In a great battle near Milan he defeated the Alemanni and other northern tribes which had made an irruption into North Italy, and gave evidence of his personal bravery and abilities. He was also well informed in literature, and was both an orator and a poet. When Valerianus was taken prisoner by the Persians, in 260, Gallienus took the reins of government, and was acknowledged as Augustus. He appears to have given himself up to debauchery and the company of profligate persons, neglecting the interests of the empire, and taking no steps to effect the release of his father from his hard captivity, in which he died. The barbarians attacked the empire on every side; revolts broke out in various provinces, where several commanders assumed the title of emperor, whilst Gallienus was loitering at Rome with his favourites and mistresses. Yet now and then he seemed to awaken from his torpor at the news of the advance of the invaders, and, putting himself at the head of the legions, he defeated Ingenuus, who had usurped the imperial title in Illyricum. But he disgraced his victory by horrible cruelties. Meantime Probus, Aurelianus, and other able commanders, were strenuously supporting the honour of the Roman arms in the east, where Odenatus, prince of Palmyra, acted as a useful ally of the Romans against the Persians. Usurpers arose in Egypt, in the Gauls, in Thrace, in almost every province of the empire, from which circumstance this period has been styled 'the reign of the thirty tyrants.' At last Aureolus, a man of obscure birth (some say a Dacian shepherd originally), but a brave soldier, was proclaimed emperor by the troops in Illyricum, entered Italy, took possession of Milan, and even marched against Rome while Gallienus was absent. Gallienus returned quickly, repulsed Aureolus, and defeated him in a great battle near the Adda, after which the usurper shut himself up in Milan, where he was besieged by Gallienus; but during the siege the emperor was murdered by some conspirators, in 268. He was succeeded by Claudius II. Trebellius Pollio has written a history of the reign of Gallienus. See also Zonaras, Aurelius Victor, and Eutropius.

Coin of Gallienus.

British Museum. Actual size. Copper gilt. Weight 223 grains.

GALLUS, AELIUS, a contemporary of Cicero, and a learned jurist, wrote a treatise on the signification of terms (Gellius, x. 22), from which a single excerpt is given in the 'Digest' (50, tit. 16, s. 157).

GALLUS, C. AQUILIUS, was a Roman eques and a friend of Cicero. He was prætor B.C. 66. Gallus was a pupil of Q. Mucius Sævola, the Pontifex, and obtained a great reputation as a jurist. He was both a skilful advocate and a learned expounder of the law. The distinguished jurist Servius Sulpicius was a pupil of Gallus, and either edited his works or incorporated them in his own writings. Gallus was prætor in the same year that Cicero was, and presided on the trials on 'ambitus' (bribery at elections); and accordingly Cicero

calls him his colleague ('Topica,' 7), and in another passage he has preserved the legal definition of *Littus* which Gallus on some occasion gave. ('Topica,' 12.) Gallus was the author of an edictal rule or formula as to *dolus malus* (fraud) in matters of buying and selling, which he promulgated as prætor. (Cic., 'De Officiis,' iii. 14; 'Dig.' 9, tit. 2.) The *Lex Aquilia*, which gave the *actio damni injuria* ('Dig.' 9, tit. 2; Gaius, iii. 210), was not proposed by this Aquilius, but by a tribune Aquilius. The high opinion which Cicero entertained of his friend Gallus is expressed in his oration *Pro A. Cæcina* (c. 27), where he pronounces upon him a eulogium which few lawyers have merited: "The authority of such a man can never have too much weight, whose judgment the Roman people have seen tried in providing security against fraud, not in showing how fraud may be practised; a man who never separated the principles of law (*ius civile*) from those of equity, who for so many years dedicated his genius, his industry, and his integrity to the Roman people, which integrity was ever ready and ever at command; who is so great and good a man that he seems to have been formed a lawyer by nature, and not by education; so skilful and so learned that not knowledge only but goodness too appears to be the product of the law; whose genius is so powerful, whose integrity so manifest, that whatever you draw from that source you will find to be pure and clear." Cicero's oration *Pro P. Quintio* was made before Gallus as *iudex*. Gallus is cited several times in the 'Digest' (50, tit. 16, a. 77; 46, tit. 4, a. 18, &c.), but there is no excerpt from his writings. Gallus devised or expounded some clauses of the formula of *Acceptatio*. ('Dig.' 46, tit. 4, a. 18.)

GALLUS, JULIUS AQUILA, or Julius Gallus Aquila, a jurist under the empire, of uncertain date. There are two excerpts in the 'Digest' from his '*Liber Responsorum*' (26, tit. 7, a. 34; and 26, tit. 10, a. 12).

GALT, JOHN, was born at Irvine in Ayrshire, on the 2nd of May 1779. His father, a sea-captain in the West India trade, removed to Greenock, when John was about eleven years of age; and in that busy town he received an education for commercial pursuits. He spent some time as a clerk in the Greenock custom-house; whence he was transferred, in the same character, to the counting-house of a mercantile firm in the place. When he was between twenty and twenty-five years of age he left Scotland for London, where he intended to establish himself as a merchant. His literary propensities however which had previously led him into frequent compositions, were further nourished by a few months of inaction in the metropolis. The result was, the production of a poem in octo-syllabic verse called '*The Battle of Largs*,' portions of which were printed in the '*Scots Magazine*,' 1803 and 1804; and on the originality of which (as having preceded Sir Walter Scott's metrical romances) he prided himself not a little in after-life. Other studies, chiefly in history and political economy, were prosecuted occasionally after he had embarked in commerce. This he had done in partnership with another young Scotchman; but the partners disagreed, their affairs became entangled, and in about three years the firm was bankrupt. After a short attempt to re-establish himself in business along with a brother, Mr. Galt entered himself at Lincoln's Inn; but determining (partly for the sake of his health) to spend abroad some part of the time before his being called to the bar, he left England in 1809.

His travels lasted for nearly three years. He afterwards described them in two works: '*Voyages and Travels in the years 1809, 1810, and 1811, containing Statistical, Commercial, and Miscellaneous Observations on Gibraltar, Sardinia, Sicily, Malta, and Turkey*,' 1812, 4to; and '*Letters from the Levant, containing Views of the State of Society, Manners, Opinions, and Commerce, in Greece and several of the Principal Islands of the Archipelago*,' 1813, 8vo. Soon after his return he married Elizabeth, daughter of Dr. Tilloch, the editor of the '*Philosophical Magazine*,' and also proprietor of the '*Star*' newspaper, on which Mr. Galt was for some time employed. By this lady he left two sons. He now wrote the following works:—'*The Life and Administration of Cardinal Wolsey*,' 1812, 4to, 1818, 8vo; '*Reflections on Political and Commercial Subjects*,' 1812, 8vo; a volume of '*Tragedies*' (Maddalen, Agamemnon, Lady Macbeth, Antonia, and Clytemnestra), 1812, 4to; '*The Life and Studies of Benjamin West, Esq.*,' 1816, 8vo, 1818, 8vo. He edited also, during its short career, '*The New British Theatre*,' which was at first intended to contain a series of dramas rejected by the managers; and in which, besides other contributions of the editor, was printed a vigorous tragedy called '*The Witness*.' These productions however were composed in the intervals left by undertakings of other kinds, chiefly commercial. In the course of his travels he had devised a scheme for importing British goods into the Continent by way of Turkey, notwithstanding Napoleon's decree of exclusion; and he spent some time in vain endeavours to obtain support for this plan. On another occasion he acted as a parliamentary agent for a Scottish canal bill. He had given up the study of the law, but he was desirous to obtain a footing in some department of active business, entertaining a strong reluctance to making literature the main employment of his life.

Down to this time, indeed, his literary success had by no means been great. His works had not generally obtained credit even for the shrewdness and comprehensiveness of thinking, and the acute observation of life, which they really evinced: while his tendency to paradox in opinion, his oddity and clumsiness of language, and the

coarseness with which his vigour was alloyed, had furnished topics of ridicule to some who thought his works worth criticising.

He was hardly more successful in his next literary attempt, '*The Earthquake*,' 3 vols. 12mo, 1820, a serious novel, marked by that clumsy and gloomy strength of feeling which pervaded his dramas. But he now hit upon the ground in which lay his strength, the delineation of familiar Scottish life, in his own admirable vein of quaint, shrewd, homely, observant humour. In 1820 and 1821 his '*Ayrshire Legatees*' appeared in successive numbers of '*Blackwood's Magazine*;' and the work was immediately published separately. Its popularity encouraged him to a series of sketches similar in character. The next of these was '*The Annals of the Parish*,' 1821; which however had been written several years before. Then came the '*Provost*,' '*The Steamboat*,' and '*Sir Andrew Wylie*' (3 vols.), all in 1822; '*The Gathering of the West*,' in 1823; and then in a somewhat different style, '*The Entail*,' 3 vols. 1823; and two historical novels, '*Ringan Gilbaize*' and '*The Spaw-wife*,' in 1823.

The reputation which Mr. Galt had acquired for activity in business, and for acquaintance with the principles and practice of commerce, now opened up for him the most brilliant prospects of his life. Certain inhabitants of Canada gave him a commission as their agent, to prosecute their claims on the home government for losses which they had suffered during the occupation of the province by the forces of the United States. The negotiations arising out of this affair issued in the adoption by the government of a proposal made by Mr. Galt, to sell crown lands in Upper Canada, for the purpose of defraying the claims of his constituents. The Canada Company, incorporated in 1826, undertook to purchase those lands and to colonise them. Before the company obtained its charter, Mr. Galt had gone out as one of the government commissioners for valuing the lands, and had returned to England in the summer of 1825. In the autumn of 1826, when the sales had taken place, he was sent out by the Company, being at first employed in making inquiries for them and in arranging their system of management; but afterwards as the superintendent of their operations. Under his direction were founded the earliest of the settlements which have since risen into importance: Guelph was entirely a place of his making; and the village of Galt received its name from him. His conduct however, although distinguished by great intelligence, energy, and enterprise, appears to have been deficient not only in commercial caution, but in deference both to the provincial government and to his employers at home, and he himself maintained that the colonial authorities were prejudiced against him as a democrat, by misrepresentations of the tenor of his books of travels. The governor, Sir Peregrine Maitland, sent home complaints against him; alarm was excited about the Company's affairs; and the directors superseded him. He returned to England in the spring of 1829, after a residence of about two years and a half. Soon afterwards, being pressed by some of his creditors, he took the benefit of the Insolvent Debtors' Act.

After this unfortunate catastrophe, Mr. Galt, now fifty years old, did not again make any sustained attempt at obtaining mercantile occupation. The embarrassment of his affairs forced him upon authorship for the subsistence of himself and his family, and although he was not able to produce any work comparable to the few which had gained for him his literary celebrity, the circumstances in which his exertions were made were such as to render his active industry at once meritorious and touching. His earliest works in this period were his novels of '*Lawrie Todd*' and '*Southernman*,' and the caustic '*Life of Lord Byron*,' 1830. While writing the last of these he undertook the editorship of the '*Courier*' newspaper, which however he very speedily resigned. His health now broke up rapidly. He had already had a slight shock of paralysis; a second occurred soon after his withdrawal from the newspaper. But his literary exertions were never relaxed, unless for a short time, when he attempted the formation of a new American Land Company.

About midsummer 1832 paralysis recurred with increased violence; and from that time he was a confirmed invalid. He retired to Scotland, where repeated attacks of palsy made his body an utter wreck, but with surprisingly little effect on his courage or on the vigour of his intellect. His memory failed much, but his invention was active to the last. He continued to dictate his compositions long after he had lost the use of every limb. Volume after volume, so composed, and committed to the press, as he himself said, "to wrench life from famine," ought to receive, not the unfavourable judgment merited by unavoidable defects, but the compassionate forbearance due to the manly fortitude of the ill-fated author. Among these fruits of decay, there were, besides several novels and tales, and contributions to periodicals, two works which give, in a very incomplete and disjointed state, much information about his life and writings: '*The Autobiography of John Galt*,' 2 vols. 8vo, 1833; and '*The Literary Life and Miscellanies of John Galt*,' 3 vols. 12mo, 1834.

Mr. Galt died at Greenock on the 11th of April 1839, when he had almost completed his sixtieth year, and a few days after he had suffered his fourteenth stroke of palsy. The list of his writings, as given by himself (perhaps incompletely, and omitting many papers furnished to periodicals), is very large. His novels alone are twenty-four in number, making about fifty volumes; his dramas are hardly less numerous; his biographical and miscellaneous works are even more so.

GALUPPI, BALDASSARE, born 1703, died 1805, a composer of great reputation in his day, very commonly known by the name of *Buranella*, from his birth-place, Burano, near Venice. He was a disciple of Lotti, and his first opera was produced at Venice in 1722. In the middle of the last century Galuppi's works were highly esteemed, and some of his compositions would now, if properly arranged, find admirers among the lovers of good dramatic music.

GALVANI, ALOYSIUS (Lewis), was descended from a respectable family of Bologna, which had produced several distinguished men of letters. He was born in that town in 1737, and in consequence of a religious turn of mind which he strongly displayed during his childhood, was at first designed for holy orders and to take the monastic vows. He afterwards changed his intentions while studying at the university of Bologna, and married the daughter of his tutor Galeazzi, who was a professor at that university, and with whom he had for some time lived on terms of close intimacy. His degree of M.D. was conferred in 1762, and his fame had so far increased that he received the appointment of Lecturer on Medicine at the Institute of his native town. In the 'Memoirs' of this body we find contributions on various medical subjects by Galvani. He also published separately 'Observations on the Urinary Organs,' and 'On the Organs of Hearing in Birds;' but an accidental circumstance, of which he availed himself with acuteness and much judgment, introduced him to a novel subject, the announcement of which at that time excited deep attention throughout Europe, and gave birth to a new and fruitful branch of physics, which yet retains in all countries the name of its first observer.

During his temporary absence from his house, his wife, who was about to prepare some soup from frogs, having taken off their skins, laid them on a table in the studio near the conductor of an electrical machine which had been recently charged. She was much surprised, upon touching them with the scalpel (which must have received a spark from the machine), to observe the muscles of the frogs strongly convulsed. She acquainted him with the facts upon his return. Galvani repeated the experiment, and found that it was necessary to pass a spark or communicate electricity through the metallic substance with which the frogs were touched. After having varied the experiment in several ways, he was led to conclude that there existed an animal electricity both in nerves and muscles, and some future experiments appearing favourable to that erroneous inference, he seems to have clung to that opinion during the remainder of his life, notwithstanding the experiments of Volta and others, which showed at least that the moisture on the surface of the frog acted as a conductor.

The following circumstance was that on which Galvani most relied for the accuracy of his opinion:—Having seen the effects of the direct electricity of the machine on the muscles of frogs, and that by exposing only the spine, legs, and connecting nerves to the electrical action a very small charge was sufficient to produce the convulsive motions; he imagined that the atmospheric electricity, though of feeble tension, might be sufficient to produce like results. He therefore suspended some frogs thus prepared by metallic hooks to iron railings, when he observed that the convulsed motions depended on the position of the frog relative to the metals. The same phenomenon led Volta to an opposite conclusion, and a war of opinion for some time divided philosophers. Into this dispute it will not be necessary now to enter; ultimately Volta triumphed over Galvani, but failed to convince him.

The work in which Galvani developed his views relative to this new class of phenomena was published in 1791, under the title 'Aloysii Galvani de viribus Electricitatis in Motu Musculari Commentarius,' in which he infers that the bodies of animals possess a peculiar kind of electricity, by which motion is communicated by nerve to muscle, and in these experiments he regarded the metals acting only as conductors between these substances, which he thought accounted for the observed contractions of the muscle, in the same manner that the dissimilar electricities on the interior and exterior surfaces of a Leyden jar reunite with explosion through a metallic conductor. If the reader is desirous to make an experiment of this kind, let him separate the head and upper parts of the body of a frog, remove the skin from the legs, clear out the abdomen, separate the spine below the origin of the sciatic nerves, that they alone may form the connection with the legs; then envelop the spine and nerves with tinfoil, and, placing the legs on silver, complete the circuit by making the two metals touch: the convulsive motions will be instantly produced.

Philosophers in other countries hastened to repeat and vary these experiments. Fowler found that when the circuit was completed by the eyes, the contact of the metals produced the sensation of a flash of light; and Robinson remarked the acid taste when the tongue was used between the metals, to which he also attributed the peculiar taste of porter when drank from a pewter vessel. It may be added that Sulzer, as early as 1767, described the influence upon taste caused by the contact of different metals with each other and with the tongue; results of this kind were pursued with more eagerness than nature seemed willing to gratify, and the influence of Galvanism on the senses of smelling and hearing, which Cavallo thought he had observed, have not been verified, or rather have been disproved.

The interesting researches of Galvani having acquired such extensive notoriety (See 'Phil. Trans.,' 1793), introduced him to the pleasures

and the troubles of an extensive correspondence. In 1797 Galvani made a voyage along the shores of the Adriatic for the purpose of confirming his notions on animal electricity by experiments on the *Gymnotus*, from which he concluded that the brain contributed to produce the observed effects. His wife, who had proved herself a sensible and an affectionate woman, died soon after his return, a loss which he seems to have felt very severely. His afflictions were increased during the French occupation of Italy; he was expelled from the offices which he held, because he refused the prescribed oaths when Bologna formed a part of the Cisalpine republic. His pecuniary circumstances at this time, as well as his health, were in a very low state, and shortly after his restoration to his former offices he died, in 1798. Galvani gave his name to the department of electricity which originated from these experiments, though its early progress was due in a much greater degree to his contemporary, Volta, by whom piles were first constructed for increasing the intensity of the electricity produced by a single pair of plates.

GAMA, VASCO DE, the first European navigator who found his way to India by doubling the Cape of Good Hope, was born at the small sea-port town of Sines in Portugal. The date of his birth, and the circumstances of his early life, are not mentioned. It appears that he was in the household of Emanuel king of Portugal, and having devoted himself to navigation and discovery, was appointed to the command of an expedition which was to seek its way to the Indian Ocean by sailing round the southern extremity of Africa. The notion of this passage was by no means a new one, and when it was taken up by the Portuguese sovereign its practicability had been pretty well established. In 1487 Pedro de Covilham set out for India by way of the Mediterranean, the Isthmus of Suez, and the Red Sea, and he was accompanied as far as Egypt by Alfonso de Payva, who then left him to go in search of 'Prester John,' a great Christian king, who, after being sought for in various countries, was now reported to be living in a high state of civilisation in the eastern parts of Africa. Before their departure from Portugal, Caladilla, bishop of Viseu, gave these travellers a map of Africa, in which that continent was correctly described as being bounded on the south by a navigable sea. This map, or the materials for it, had probably been procured from the trading Moors of North Africa, to whom the Portuguese had long before been indebted for much information concerning that continent.

Payva added little to geographical knowledge; but Covilham crossed the Indian Ocean, visited Goa, Calicut, and other places on the coast of Hindustan, acquired an exalted notion of the trade and wealth of those parts, and on his return towards the Red Sea he obtained from Arabian mariners some information concerning the eastern coast of Africa as far as Sofala on the Mozambique Channel. Soon after his return he visited Abyssinia, where he was detained by the government for some thirty years. Shortly after arriving in that country he found means of forwarding letters to the king of Portugal, in which he stated that no doubt existed as to the possibility of sailing from Europe to India by doubling the southern point of Africa, and he added that that southern cape was well known to Arabian and Indian navigators. The reports of Covilham, and the well-known importance of the trade with India, greatly excited the Portuguese, who moreover had long been pursuing discovery on the western coast of Africa. At the end of December 1487, Bartholomew Diaz had returned to Lisbon after discovering 300 leagues of coast, and correctly laying down the Great Cape, which he doubled in a storm without knowing it, but which he had properly recognised on his return.

Vasco de Gama sailed from Lisbon on the 8th of July 1497, five years after the discovery of the New World by Columbus. The royal squadron which he commanded consisted only of three small vessels, with sixty men in all. The Cape of Good Hope seemed to merit the name which had been given to it by Diaz—Cabo Tormentoso. Dreadful tempests were encountered before reaching it, the winds were contrary, and their fears and their sufferings caused a mutiny among the sailors, who tried to induce Gama to put back. But the firmness of the commander quieted the apprehensions of his men, and on the 19th of November, with a stormy sea, he doubled the Cape and turned along the eastern shore. On reaching the African town of Melinda, which belonged to a commercial and civilised people, a branch of the great race of Moors, or Arabian Mohammedans, he found several Christian merchants from India, and he also procured the valuable services of Malemo Cana, a pilot from Guzerat. This man was a skilful navigator: he was not surprised at the sight of the astrolabe, or at their method of taking the meridian altitude of the sun. He told them that both the instrument and its uses were familiar to the mariners of the Eastern seas. Under the guidance of this pilot Gama made the coast of Malabar in twenty-three days, and anchored before Calicut on the 20th of May 1498, then a place of considerable manufactures and foreign trade, which was chiefly in the hands of Moors or Arabs. Gama opened communications with the zamarin or sovereign prince of Calicut, who, after some negotiation, agreed to receive him with the honours usually paid to an ambassador.

The sailors, who were well acquainted with the character of the Moors, feared that if their commander put himself in their power he would fall a victim to their treachery and jealousy. The officers also and his brother Paul strongly dissuaded him from landing. But Gama was resolved. Arming twelve of his bravest men, he went into his

boat, strictly charging his officers, in case he should be murdered, to return immediately to Portugal and there announce to the king the discoveries made and his fate. On landing he was received with great pomp and ceremony by the natives, who conducted him through the town to a house in the country, where on the following day the zamarin granted him an audience. At first his reception was very favourable, but the tone of the prince soon changed—a circumstance which the Portuguese attribute to the intrigues of the Moors and Arabs, who were jealous of the new comers. The ill-humour of the zamarin was not soothed by an unlucky omission. Gama had not brought any suitable presents, and the few paltry things he offered were rejected with contempt by the officer appointed to inspect them. Whatever may have been the designs of the zamarin against the Portuguese, Gama, it is said, at last succeeded in convincing him of the great advantages he might derive from a commercial and friendly intercourse with the Portuguese; and he certainly was allowed to get back to his ships in safety. As soon as he was on board he made sail, and after repairing his ships at the Angedive Isles, on the coast a little to the north of Calicut, he again stood across the Indian Ocean. He touched at Magadoxa, or Mukdeesha, on the eastern coast of Africa and nearer to the Straits of Bab-el-Mandeb than he had gone on his outer voyage. He next anchored at Melinda, and took on board an ambassador from the Mohammedan prince of that place. He arrived at Lisbon in September 1499, having been absent about two years and two months. His sovereign received him with high honours, and conferred on him the sounding title of Admiral of the Indian, Persian, and Arabian seas.

This voyage of Gama is a great epoch in commercial history: it showed the nations of the West the sea-road to the remote East; it diverted the trade of the East from the Persian Gulf, the Red Sea, Asia Minor, Egypt, and Italy, the routes in which it had run for 1400 years; and it led ultimately to the establishment in India of a vast empire of European merchants. The effect it had upon Italy was most disadvantageous, and though there were other causes at work, the decline of the great trading republics of Venice and Genoa may be traced to the discovery of the passage to India by the Cape of Good Hope. Soon after Gama's return Emanuel sent out a second fleet to India, under the command of Pedro Alvares de Cabral. The most remarkable incident of this voyage was the accidental discovery of Brazil. From Brazil however the little fleet got to India, and Cabral established a factory at Calicut—the first humble settlement made by the Europeans in that part of the world. But Cabral had scarcely departed when all the Portuguese he left behind were massacred by the natives or Moors, or by both. The Portuguese government now resolved to employ force. Twenty ships were prepared and distributed into three squadrons; Gama set sail with the largest division, of ten ships—the others were to join him in the Indian seas. After doubling the Cape, he ran down the eastern coast of Africa, taking vengeance upon those towns which had been unfriendly to him during his former voyage. He settled a factory at Sofala, and another at Mozambique. On approaching the coast of India he captured a rich ship belonging to the Soldan of Egypt, and after removing what suited him he set fire to the vessel; all the crew were burned or drowned, or stabbed by the Portuguese. He then went to Cananore, and forced the prince of that country to enter into an alliance with him; on arriving at Calicut, the main object of his voyage, he seized all the ships in that port. Alarmed at his display of force—for Gama had been joined by some of the other ten ships—the zamarin condescended to treat; but the Portuguese admiral would listen to no propositions unless a full and sanguinary satisfaction were given for the murder of his countrymen in the factory. Gama waited three days, and then barbarously hanged at his yard-arms fifty Malabar sailors whom he had taken in the port. On the next day he cannonaded the town, and having destroyed the greater part of it, he left some of the ships to blockade the port, and sailed away with the rest to Cochin, the neighbouring state to Calicut. These neighbours being old enemies, it was easy for Gama to make a treaty with the sovereign of Cochin, whom he promised to assist in his wars with Calicut. It is not quite clear whether a war existed at the time, or whether Cochin was driven into one by the manoeuvres of the Portuguese; and according to some accounts, Gama only renewed a treaty which had been made by Cabral two years earlier. It was Gama however who first established a factory in Cochin, at the end of 1502. In the following year, the Albuquerque obtained permission to build a fort on the same spot; the Portuguese then became masters of the port and the sea-coast, and Cochin was thus the cradle of their future power in India. Gama left the zamarin of Calicut with a war with Cochin on his hands; and five ships remained on the coast of Malabar to protect the settlement. The admiral arrived at Lisbon with thirteen of the ships in the month of December 1503. The court created him Count of Videqueyra. Gama however was not reappointed to the command in India, where the career of conquest was prosecuted by Albuquerque, Vasconcellos, and others. In 1524, eight years after the death of the great Albuquerque, Gama, who had been living quietly at home for nearly twenty years, was appointed viceroy of Portuguese India, being the first man that held that high title. He died in December 1525, shortly after his arrival at Cochin. His body was buried at that place, and lay there till 1538, when, by order of John III., his remains were carried to Portugal.

Vasco de Gama was a brave and skilful man, but owing to several circumstances his fame has been raised somewhat above his real merits. The main cause of this is probably to be found in the great national poem of the immortal Camoens, of a portion of which Gama is the hero, the adventures of his first voyage to India being described with even more than the usual brilliancy and amplification of poetry. (Barros, *Decades*; Castanheda and Lafitau, *Hist. Conqu. Portug.*; Cooley, *Hist. Mar. Discov.*; Camoens.)

GANDON, JAMES, an eminent architect, was born about 1741-2. He studied under Sir William Chambers, and was the first who obtained the gold medal for architecture at the Royal Academy, on which occasion Reynolds is said to have complimented him, and to have predicted his future fame. He began to make himself known in his profession by undertaking a continuation of Campbell's 'Vitruvius Britannicus,' the first volume of which, or fourth of the series, appeared in 1767, and the second in 1771. Though he had John Woolfe for his coadjutor in the work, Gandon appears to have taken the chief share of the management and editorship upon himself. The work is however a very poor one, being sadly deficient in regard to sections; and while many buildings of considerable interest are omitted, several are given which possess very little interest or merit; neither does the letter-press afford that information—easily given at the time—as to dates, architects, and other particulars, which would now be valuable. So far from being descriptive and explanatory of the respective buildings, the letter-press, which appears to have been written by Gandon himself, and which certainly does not say much for his literary abilities, tells us very little more than what may be made out from the plates themselves. Even as an architect Gandon does not appear to any particular advantage in the 'Vitruvius,' his 'Court-Hall' at Nottingham (vol. v.) being of little and that negative merit. Gandon however tells us that he made five different designs for that building, and that he was obliged to pare down his ideas to suit the notions and the frugality of his employers. Still his building at Nottingham obtained for him the notice of Sir George Savile, Mason the poet, and other persons of distinction, and probably brought him professional employment, as he discontinued the 'Vitruvius' after the second supplementary volume.

Gandon's architectural talents however found their true field opened to them in Ireland. On premiums being offered by advertisement for the best design for a Royal Exchange at Dublin, Gandon's obtained the second, and those by Cooley (COOLEY) and Thomas Sandby the first and second prizes. What Gandon's design was is not known, but its merits attracted the attention of the Earl of Charlemont, Colonel Burton Couryngham, and other admirers and patrons of art. Nor was it long before an opportunity presented itself in the Irish capital very far exceeding the Exchange both in magnitude and importance. The Custom-House of Dublin, a magnificent pile of 375 by 209 feet (begun in 1781 and finished 1791), is one of the noblest structures of the kind in the world—perhaps the noblest of all—and would of itself alone suffice for the fame of any architect. Dublin is also indebted to him for several others of its finest buildings,—the eastern front and Corinthian portico of the House of Lords, now the Bank of Ireland; the Four Courts (begun by Cooley, but completed by him, with great alterations from the original design), and the King's Inns. He also built the Court-House at Waterford, and probably many other edifices besides, although they have not obtained distinct notice. It is to be regretted that Gandon did not perform for himself and his own works the same office as he had in the earlier part of his life done for those of other architects; and that he did not bequeath us such an autobiography of his professional career. Gandon died at Cannonbrook, near Lucan, Ireland, at the beginning of 1824.

GANGANELLI. [CLEMENT XIV.]

GANS, EDWARD, was born at Berlin on the 22nd of March 1793, and descended from Jewish parents of great respectability. His father was a wealthy man, noted for his sarcastic wit, and highly esteemed for his patriotism: he enjoyed the particular confidence of the Prussian state chancellor, the Baron (afterwards Prince) Hardenberg. After having been educated at the gymnasium called 'Das Graue Kloster' (the Grey Cloister), in his native town, Gans entered the University of Berlin, in 1816, as a student of law. In the following year he went to Göttingen, and there, at the age of nineteen, obtained the prize for the best answer to the question proposed by the faculty of law on the history and the civil and political laws of the island of Rhodes: the dissertation which he wrote on the subject was printed at the expense of the faculty. In 1818 he left Göttingen, and went to Heidelberg, where he enjoyed the friendship and esteem of Thibaut the jurist and Hegel the philosopher, and his intercourse with these celebrated men had a lasting influence on his literary pursuits. At Heidelberg he wrote several articles for the 'Civilistische Archiv,' edited by Gonsler, Thibaut, and Mittermaier; and the 'Zeitschrift für die Wissenschaft des Judenthums,' in which he gave eminent proofs of his talents and learning. He took the degree of doctor in law in 1819, in the same university, and there also published a little work 'Ueber Römisches Obligationen-Recht.'

In 1820 Gans returned to Berlin, was admitted by the university as public lecturer on law, and in the same year published a work which created general sensation, namely, 'Scholien zum Gajus.' The

first complete edition of Gaius, by Göschen, only came out in the following year, 1821, but the printing was begun as early as 1819; the printed sheets were distributed among the friends of the editor, and parts of the 'Institutes of Gaius' had already appeared, and were commented upon in several learned reviews in Germany. The first in rank among the earlier commentators were Savigny and Göschen, and it was principally against their opinions that Gans took the field in his 'Scholia.' He was rather rash in publishing his 'Observations' at so early a period, and on the whole the work is superficial; but it contains some profound remarks, and shows the solid knowledge which the youthful author had acquired of the historical part of the Roman Law. The learned public in general considered it a most valuable work, and they were certainly not wrong in judging it favourably. Gans met of course with many distinguished opponents; and those who could not defeat him on the field of science traduced his character by styling his work the attempt of an insolent and self-conceited youth to overthrow the authority of his masters. Gans was not discouraged: he entered into a closer alliance with Hegel and Thibaut, who, with Feuerbach, Grollmann, and other distinguished jurists, were the originators of the school of philosophical jurisprudence, of which young Gans soon became one of the most eminent leaders. Their principal aim was, and still is, to explain the nature of law and its bearing upon the past as well as the future, through the medium of philosophical ideas, and to show its connection with the moral, social, and political progress of mankind; and it cannot be denied that they exercised a beneficial influence upon legislation, the bar, and the judicature. Many of their followers however were misled by the influence of some favourite system of metaphysics; forgetting that every law is, or at least ought to be, the product of some national want, they published legal commentaries fit to puzzle at once the most plain and straightforward judge and the most sophistical advocate; and it was apprehended that if they should ever obtain a complete ascendancy over legislation, Germany would be blessed with a new edition of Plato's 'Republic,' rather than with a new code and a constitution answering the wishes and the wants of the people. The historical school, on the contrary, cared little for the political or social progress of the people. Their attention was chiefly directed to the past; and, satisfied with having discovered the historical development of laws, they were prouder of having added to the knowledge of obsolete, forgotten, or obscure things than to the knowledge of modern law, however great might be its practical importance. It was apprehended that, if the historical school should become the director of legislation, they would reduce Germany to slavery, since the feudal system, though oppressive, and the Justinian law, though the result of absolutism, were both regarded with favour by them as being completely developed 'historical' productions. On the whole, the philosophical school found more adherents among practical lawyers, and the historical school among learned lawyers, scholars, and antiquarians.

Between the philosophical and the historical schools stood and still stands the school of positive jurisprudence, which comprehends all such jurists, mostly practical lawyers, as write on law with a practical view, the labours of the other two schools being rather of a theoretical character. One of the most distinguished positive jurists is Solomon Philip Gans, an advocate of the supreme court at Celle in Hanover, and the author of several excellent works and treatises on law, and who ought not to be confounded with his late kinsman, Edward Gans. In the scientific struggle between the philosophical and the historical school Edward Gans was better enabled to take a leading part, as he had a profound knowledge of the history of the Roman law, combined the qualities of a scholar with those of an eloquent and acute advocate, and could consequently attack his opponents with success on the very field where they thought themselves invincible. His first attack, as already said, was contained in the 'Scholia' to Gaius. The second was 'Das Erbrecht in weltgeschichtlicher Entwicklung,' Berlin, Stuttgart, and Tübingen, 4 vols. 8vo, 1824-35 (the Law of Succession, its historical development, and its importance for the history of the world), by which he placed himself among the first jurists of Germany. In this splendid work the author treats on the law of succession of the most eminent nations of the world, ancient and modern, European, American, and Asiatic, even those of the Chinese, and shows how the alterations which the law has gradually undergone are combined with the history of the nations, and their advance towards social and political perfection. In 1825 Gans was appointed professor extraordinarius, and some years afterwards professor ordinarius at the university of Berlin. The latter dignity is not bestowed upon Jews in Prussia, but Gans had adopted the Christian religion at Hamburg some time previous to his appointment. In 1826 he published 'System des Römischen Civil-Rechts' ('System of the Roman Civil Law'), and founded a new review, of which Berlin stood in great need, the 'Jahrbücher für wissenschaftliche Kritik' ('Year-Books for Scientific Criticism'). After the outbreak of the French revolution in 1830 he went to France, a country which he had already visited previously, as well as England; and his fame being already established in France, he was well received by the most eminent men in Paris, among whom he preferred those who stood at the head of the great political movement. From France he went to England. The Prussian government now became suspicious, and set spies upon him, who reported every

word they could catch. On his return to Berlin he began a course of lectures on modern history in the university, and his learning, eloquence, wit, and liberal principles attracted an immense crowd not only of students, who alone are entitled by law to attend the lectures delivered in the German universities, but of public functionaries, advocates, officers in the army, and others who endeavoured to get and actually got admission. He lectured in the largest room of the university, which was not only full to suffocation, but hundreds of gentlemen were seen standing outside, in the hall and in the great court, in spite of a very severe winter (1832-33), and all eager to learn from their friends inside the subject of the lecture, or the spirited observations of the lecturer. This was a capital opportunity for the enemies of Gans to denounce him to the Prussian government as a demagogue; and after some time the government compelled him to give up his lectures, on the pretext that he, being a professor of law, had no right to deliver lectures on history. Little discouraged by this check, Gans introduced subjects connected with modern history into his lectures on law; and the Prussian government, dreading his sharp tongue as well as his principles, now commenced a system of annoyance and petty persecution against him, in which it was well assisted by the numerous enemies of the professor, and which embittered his life, and undoubtedly contributed to his untimely death. In the following years Gans published 'Vorlesungen über die Geschichte der letzten fünfzig Jahre' ('Lectures on the History of the Last Fifty Years'), in Raumer's 'Historisches Taschenbuch' for 1833 and 1834; 'Verzählte Schriften juristischen, historischen, staatswissenschaftlichen und ästhetischen Inhalts' ('Miscellaneous Writings on Jurisprudence, History,' &c.), Berlin, 1834, 2 vols. 8vo; 'Rückblicke auf Per-onen und Zustände' ('Retrospective View of Individuals and Events'), Berlin, 1836; 'Grundlage des Besitzes' ('The Basis of Possession'), Berlin, 1839, an attack upon Savigny's celebrated work on the 'Law of Possession among the Romans.' Most of his time he devoted to a complete edition of the works of Hegel, those that were published already, and those which Hegel left partly unfinished in manuscript, especially on Hegel's 'Philosophy of History'; and without Gans the world would perhaps never have seen a complete edition of Hegel, he being, according to Hegel's own words, the only man who thoroughly understood his great but obscure master. On the 1st of May 1839, while dining with a friend, Gans fell suddenly speechless from his chair, being struck by apoplexy; after lingering a few days, he died on the 5th of the same month.

Gans was one of the most learned, most witty, and most eloquent men of Germany; distinguished as an author and unsurpassed as a lecturer. His fame would have been still greater had he had an opportunity of displaying his talents on the political stage. No man was his equal in controversy: he confounded the most skilful of his adversaries by his sarcastic replies. Those whom he wounded deepest and spared least were men of acknowledged authority, or of high rank or birth, and among them he had his bitterest enemies. He belonged to those highly-gifted Jews, his contemporaries, who held, or still hold, such an eminent rank among the learned, the poets, and the artists of Germany, as Heine the poet, Börne the political writer, Mendelssohn the composer, Michael Behr the poet, his brother Meier Behr, commonly called Meyerbeer the composer, and many more. Gans's successor as professor of law in the University of Berlin was Dr. Stahl, a man of ultra-monarchical principles, and a disciple of Haller, the author of the 'Restoration of Political Science.'

(*Neuer Nekrolog der Deutschen; Allgemeine Zeitung* (Supplement) of 1839, No. 132; *Conversations-Lexicon der Gegenwart*.)

GARAY, JA'NOS, a popular modern Hungarian poet, was born in 1812, at Szegszard, in the county of Tolna; first attracted attention in 1834 by his heroic poem of 'Caatar,' written in imitation of Vörösmarty's epics; and continued rising in reputation for some years, during which he was one of the favourite contributors to three or four of the Hungarian annuals, and gained several prizes from the societies which offer premiums for successful contributions to the Magyar drama. He gained a scanty subsistence by literary labours of less ambition—by a 'Handbook of Hungarian and German Dialogues,' and by editing a sort of almanac, and at one time a newspaper. In his later years, when his health was bad and he had almost lost his eyesight, he and his family were preserved from positive want by his appointment to a subordinate place in the university library of Pesth, where he died, after a long illness, on the 5th of November 1853. He was a member of the Hungarian Academy. His last productions are 'Elizabeth Batori,' a play in 5 acts; 'Christina Frangepán,' a poetical tale; a series of historical legends entitled 'The Arpads'; a collection of poems called 'The Pearls of the Balaton Lake'; and 'Saint Ladislaus,' an historical poem. He was enthusiastically patriotic, and took a warm interest in the progress of Hungary during what is now almost looked back upon as its golden age, from 1840 to 1848. In his lyric poems he takes by preference national subjects, and those connected with modern improvement, such as the power of steam, and the wonders of railways.

GARÇÃO, PEDRO ANTONIO CORREA, the best lyric poet of Portugal, was born at Lisbon in 1735. After labouring strenuously to correct the bad taste of his countrymen, his somewhat premature death at forty prevented the further success of his talents and exemplary perseverance. His attempt to supersede rhyme by quantity

proved however a failure; not indeed from any lack of ingenuity on his part, but owing to the similarity and slight difference between long and short syllables, and the want of a dactylic copiousness which characterise modern languages, in even southern Europe. Garção's odes, which are clothed in the diction of the 16th century, soar above the wearisome sameness of the sonnet and the eclogue of many a distinguished poet. His satires and epistles may be reckoned among the best in modern literature, and are decidedly more Horatian than Ferreira's. His simple drama in iambics, the 'Theatro Novo,' was evidently intended to counteract the passion for the operatic pomp of the Portuguese stage. The 'Assemblea, ou Partida,' another specimen of his plays, in the manner of Terence, is of the same kind as the 'Cecile' of Poinset, a satire on the fashionable world, not merely a picture of fashionable manners, as Bouterwek calls it. The 'Obras poeticas de P. A. C. Garção,' in 8vo, were first published at Lisbon in 1778. Garção died about 1775. (Bouterwek; and Sismondi, *Littérature du Midi de l'Europe*, or its translation by Roscoe.)

GARCILASO DE LA VEGA, the intimate friend and associate of Boscan in the radical and successful reformation of Spanish poetry, was born at Toledo in 1500, or, according to some biographers, in 1503. His family enjoyed great consideration and military reputation; and Garcilaso himself from the age of eighteen followed Charles V. over Europe and in his expeditions to Africa till the disastrous retreat of the Imperialists from Marseille in 1536, when, being the first to mount the breach of a tower, which he was ordered to carry by assault, he lost his life in the attempt.

Despising the clamour raised against introducing into a brave nation the effeminate taste (as his opponents called it) of the conquered Italians, Garcilaso, with equal boldness but greater skill than Boscan, substituted the modern Sapphic or Italian hendecasyllabic verse, both for the short metre of the ancient romances and redondillas, and for the heroic Alexandrine and all the verses of *arte mayor*. The sweetness of many of his thirty-seven sonnets captivates the ear, while the contrast of fear and desire, of sorrow and love, which they express, touches the sympathies of his readers. His odes are still more uniformly excellent; and his last is much praised by Muratori, as his 'Flor de Gnido' is by Paul Jovius and Sir William Jones. But his masterpiece is the first of his three eclogues, which has never been equalled by any of the numerous imitations of it. Garcilaso wrote it at Naples under the inspiration of Virgil's tomb, and stimulated by Sanazaro's reputation. It is to be regretted that in this piece, as in others, his facility and copiousness of expression betrayed him into diffuseness and over-refinement. Nevertheless he is at the head of the pastoral poets of Spain, and he would perhaps have been the first of her lyric poets if he had lived longer, or if Herrera in the following century had not gained that title for himself.

Garcilaso's poems have been printed very often, and commented upon by Herrera, Sancho de las Brozas, Tamaio Vargas, and Azara, the elegant translator of Middleton's 'Life of Cicero,' and they have been excellently translated into English by the late G. H. Wiffen.

GARCILASO, the Inca, as he styled himself, was born at Cuzco, in Peru, towards the middle of the 16th century, after the conquest of that country by the Spaniards. His father, Garcilaso de la Vega, allied by blood to the noble houses of Feria and Infantado, served under the Pizarros in that expedition. He married, at Cuzco, Elizabeth Palla of the race of the Incas, who is stated in her son's epitaph at Cordova to have been sister to Huayna Capac, the last emperor of Peru. Young Garcilaso proceeded to Spain at an early age, about 1560; he obtained the rank of captain in the Spanish service, but he seems to have lived the greater part of his life at Cordova, where he died in April 1616. His contemporary, Father Benaventura de Salinas, in his 'Memorial de la Historia del Nuevo Mundo,' chapter ii., says "that he was much esteemed by the Catholic kings for the talents he displayed in writing his historical works; that he lived piously, and bequeathed by will his property, which was moderate, to the souls in purgatory." He was buried in the cathedral of Cordova, in a chapel which has been called in consequence 'Garcilaso's Chapel.' (See the Introduction to Garcilaso's 'History of Florida,' Madrid, 1723.) Garcilaso wrote a history of Peru: 'Comentarios Reales que tratan del Origen de los Incas, de sus Leyes y Gobierno,' &c., fol., Lisbon, 1609. Garcilaso's history has been much praised for its impartiality, but its merits have been exaggerated from the supposition that the author, in consequence of his Peruvian connections, had peculiar sources of information. This however seems not to have been the case. One advantage he had, that of understanding well his maternal language; and he says in his introduction that he was able to correct the misinterpretations of Peruvian words by Spanish writers. His style is reckoned inelegant and diffuse. He wrote an account of the conquest of Florida by Fernando de Soto: 'La Florida del Yncá,' Lisbon, 1605. Both Garcilaso's 'History of the Incas,' and his 'History of Florida,' were translated and published in French, 2 vols. 4to, Amsterdam, 1727.

GARCZYŃSKI, STEPHEN, Palatine of Poznan, died in 1755, at an advanced age. He spent all his life in public employments, which gave him the opportunity of acquiring a thorough knowledge of the affairs of his country. He published in Polish a political work on Poland, entitled 'The Anatomy of the Republic of Poland,' Warsaw, 1761, and Berlin, 1764.

GARCZYŃSKI, a young man of the same family, who died in 1832, in consequence of the fatigues of the Polish war of 1831, left behind him several poems, which are characterised by great beauties.

GARDINER, STEPHEN, Bishop of Winchester and Lord Chancellor of England, although he was called by another name, was believed to be the illegitimate son of Dr. Woodvil, bishop of Salisbury, who being brother to Elizabeth, Edward IVth's queen, was also related to Henry VIII. He was born at Bury St. Edmunds in 1433. His studies at Trinity Hall, Cambridge, were directed not only to Latin and Greek, but also to civil and canon law, and it was partly his skill in this latter branch of learning that led to his future greatness. When master of Trinity Hall, through his intimacy with the Duke of Norfolk, he became acquainted with Wolsey, who afterwards made him his secretary, and in this capacity he was brought under the notice of the king, with whom he rapidly ingratiated himself. An office of trust was soon committed to his charge. Dr. Stephens (as Gardiner at this time was usually called) was sent to Italy in 1527, to procure the pope's consent to the divorce of Catherine of Aragon, and no better proof can be given of his high favour with Henry than the fact that from Rome he wrote a letter to the king so private that even Cardinal Wolsey was not to see it (Burnet's 'Reformation,' where the letter is given). Though he failed in the object for which he was sent to Rome, he rendered services at this court both to the bishop of Norwich (who afterwards rewarded him with the archdeaconry of Norfolk), and to Wolsey by promoting his interests as a candidate for the papal throne. He was recalled from Rome to manage the process for the divorce in England; and because he was esteemed the greatest canonist of his time, the king would commence no proceedings until he returned. After his arrival he was made secretary of state, and having in the spring of 1531 been further advanced to the archdeaconry of Leicester, was installed bishop of Winchester in the following November. We pass over his embassies to France and Germany in order to speak more fully of his opposition to all such measures as were intended to procure a religious reformation in England. Gardiner was attached to the doctrines and forms of the Roman Catholic church; he was believed to have already reconciled himself to the pope, with whom he had had differences while urging the divorce; and he had no sooner returned to England than he urged the king to punish the sacramentaries (persons who denied the corporal presence of Christ in the eucharist) and to turn a deaf ear to the proposals of the reformers. It was impolitic, he said, to offend the pope, not only on account of the power of the holy see itself, but because the emperor would break off all commerce with him if he went to extremities against the Roman Catholic religion.

His advice was partially taken, the innovations of the reformers were obstructed, and Lambert and others were condemned and executed for their heretical opinions. "He was opposed," says Burnet, "to all reformation:" both the free use of the Scriptures and their translation into English he considered to be highly objectionable; to the disuse of confession and the omission of certain sacraments he was equally averse; and he was altogether opposed to the measures of Cranmer and his associates. He had certainly endeavoured to dissuade the king from listening to Cranmer's proposals for furthering the Reformation. In the promotion of the act of the six articles (1538), and in the subsequent enforcement of its provisions, the extent of his hostility to the reformation was most evidently displayed. The decline of Cromwell's power tended greatly to increase his authority and influence. Both these crafty statesmen had at the same time been servants to Cardinal Wolsey, the one as his secretary, the other as his solicitor; and both had risen through Wolsey's patronage: but as they had espoused opposite parties, their friendship was at an end, and Gardiner's jealousy of the vicar-general was without bounds. When circumstances [CROMWELL, THOMAS] weakened the king's confidence in the bishop's unpopular rival, he craftily assisted in his downfall, and prepared to occupy his place in the good graces of the king: the fate of Cromwell was soon sealed; a fallen favourite has few friends, and crimes were soon proved which ensured his execution (1540). It now became Gardiner's object to use all means to obtain the favour of the king. The disgust of Henry at his new queen, Anne of Cleves, was so rapidly conceived that he had scarcely married her before he began to talk of a divorce. There was no just ground whatsoever for such a separation; nevertheless Gardiner, though an accurate lawyer, promoted the king's suit. The divorce was procured, but Henry, though well aware of the assistance that Gardiner had rendered to his cause, did not wholly trust him. A perception of his excessive cunning appears to have estranged his confidence. The abilities of Gardiner were undeniable; he had also a powerful party at his side: nevertheless he could only obstruct and hinder, not wholly set aside, the measures of his opponents. The king befriended Gardiner, but he never ceased to befriend Cranmer also.

An evidence of his friendship for Cranmer is shown by his conduct to the archbishop on an occasion in which his life was in danger. The Roman Catholic party, with the bishop of Winchester at their head, attempted to attach the crime of heresy to Cranmer; but the king himself delivered a message to him to prepare him for the threatened attack, taking care afterwards to appoint such a tribunal to investigate the charges as should defeat the object of his accusers. The popularity of Gardiner indeed was not injured by the failure of this conspiracy

his restless spirit however was soon employed in another scheme, the consequences of which were not equally harmless to him. The queen (Catherine Parr), who was secretly a great favourer of the reformers, and had admitted their preachers into her apartments, in conversation with the king, whose illness added to his ordinary impatience, maintained the new doctrines, discoursing very warmly upon the subject. This vexed the king, who communicated his displeasure to Gardiner, who to please his master (as he thought), now began to plot against the queen, going so far as to write articles of impeachment against her. In this attack the chancellor was associated with him: and through an accident occasioned by him, the queen discovered the conspiracy, and by her good sense and character, which gave her great influence over the king's mind, coupled with considerable adroitness of management, she escaped the accusation. Gardiner was never able to regain the favour or countenance of the king. (Burnet.)

At Henry's death Gardiner experienced a still greater reverse. The young king and his government proceeded to make further religious changes; the use of holy water was decried, and homilies were composed which the clergy, who had abused their power of preaching, were ordered to substitute for sermons: a general visitation also was ordered, at which the new articles and injunctions were to be circulated. These things offended Gardiner, and he totally condemned them in no measured terms. If this behaviour was rash, it was also high-spirited and consistent. The consequences followed, as might have been foreseen. The council, on his refusal to comply with their injunctions, committed him to the Fleet. Here he was confined until the act of general amnesty, which passed in the December after the accession of Edward, released him. As soon as he was free he went down to his diocese, and while there he remained unmolested; but on his return to London, on account of a certain sermon which he preached on St. Peter's Day, he was seized and committed to the Tower (1548). Various conferences were held with him, and his release was promised him on condition that he would express his contrition for the past, promise obedience for the future, subscribe the new settlement in religion, acknowledge the royal supremacy, and the abrogation of the six articles. With the first of these conditions alone did he absolutely refuse to comply. The terms of liberation were afterwards rendered still more difficult. The number of articles that he was called upon to subscribe was considerably increased. On his refusal to sign them, his bishopric was sequestered, and he was soon afterwards deprived.

For more than five years Gardiner suffered close imprisonment, and it was not until the beginning of the reign of Mary that his liberty was restored (1553). If his fall from power at the conclusion of Henry's reign had been great and sudden, still greater and more sudden was the rapidity of his re-instatement. A Roman Catholic queen was on the throne, and he who had been ever the foremost of her partisans must necessarily be raised to be one of her first advisers. The chancellorship was conferred upon him. His bishopric was restored, and the conduct of affairs placed in his hands. The management of the queen's marriage-treaty was intrusted to him. He was chosen to officiate at her marriage, as he had also done at her coronation, and became her most confidential adviser. No matters, whatever they might be, could be proceeded in without his privity and concurrence; and he had his full share in the persecutions of this reign. The horrors which were not committed by his actual orders must at least have obtained his sanction, for he had reached a height of power, both civil and ecclesiastical, perhaps unequalled in this kingdom except by his master Wolsey alone. He died on the 12th of November 1555. His funeral was conducted with great pomp and magnificence. A list of his writings is given in Tanner's 'Bibl. Britannico-Hibernica,' p. 308.

The character of Gardiner may be stated in a few words. He was a man of great ability; his general knowledge was more remarkable than his learning as a divine. He was ambitious and revengeful, and wholly unscrupulous. His first object was his own preservation and advancement, and his next the promotion of his party interest. He saw deeply into the characters of those with whom he dealt, dealt with them with remarkable tact, and had an accurate foresight of affairs.

GARNET, HENRY, superior of the Jesuits in England, was the son of a schoolmaster at Nottingham, and was born about the year 1554. He was educated in the Protestant religion at Winchester College, whence it was intended that he should go to New College, Oxford, and his not having done so has been assigned to different causes by Protestant and Roman Catholic writers. He removed from Winchester to London, where he became corrector of the press to a celebrated law-printer; and, having turned Roman Catholic, travelled first to Spain and thence to Rome, where he entered the society of Jesuits in 1575. In the Jesuits' College, at Rome, he studied with great industry, became professor of Hebrew and teacher of the mathematics, and obtained such credit that in 1586 he was appointed to the English mission. Two years afterwards he was named Superior of the English Jesuits, the duties of which office he discharged with zeal and punctuality. For several years previously to the Powder Plot he remained in the neighbourhood of London, following various occupations in order to disguise his real calling. He was well known to have been implicated in the treasonable intrigue with the King of Spain immediately before the death of Queen Elizabeth, and was

suspected of other seditious practices. In order to protect himself from penal consequences, he purchased a general pardon upon the accession of James I. His association with disaffected recusants exposed him to the continued suspicion of the government, who did not regard him more favourably for that he was intimate with many of the Roman Catholic nobility, more especially with Lord Vaux, whose eldest daughter, Anne Vaux, after her father's death followed the fortunes of Garnet with singular attachment. In September 1605 a pilgrimage to St. Winifred's Well, in Flintshire, was undertaken by Garnet, in company with persons who were actively concerned at that time in the promotion of the Gunpowder Plot; and it is suspected that this unusual proceeding must have had some reference to the great blow that in two months afterwards it was intended to strike for the Roman Catholic Church. When the Powder Plot was discovered Garnet was in the neighbourhood of Coughton, the general rendezvous of the conspirators; but he removed for greater safety to Hendlip Hall, near Worcester, at the request of one Hall, otherwise called Oldcorne, a Jesuit, who was domestic priest to Mr. Abington, the brother-in-law of Lord Mounteagle, and proprietor of that house. In Hendlip were many secret passages and hiding-places which served for concealment, and to one of these Garnet and Oldcorne were soon forced to retreat; for Sir Henry Bromley, commissioned by the lords of the council, invested the house, and vigorously searched every room. A bill of attainder was introduced into parliament, which recited that Garnet, Greenway, Gerard, Creswell, Baldwin, Hammond, Hall (Oldcorne), and Westmorland, all Jesuits, had been guilty of treasonable correspondence with Spain, after and before the death of Queen Elizabeth. Father Gerard fled to the continent; Father Greenway also, after very narrowly escaping an arrest, landed in Flanders; but Garnet and Oldcorne were not so fortunate. Being cramped for want of space within their hiding-place at Hendlip, they were compelled to leave it after a confinement of seven days and as many nights, and were seized and conveyed to London, February 12, 1606.

The lords had now determined to proceed against them as conspirators in the Powder Plot. Evidence sufficient for their conviction had not yet been obtained, but every method was used to procure it, and these methods soon proved to be effectual. Oldcorne was tortured; Garnet's letters were intercepted; conversations were promoted between the two prisoners, who, while they thought themselves in private, were in fact secretly listened to by spies, who wrote down their words, and other unfair practices were also used; but for these, as for Garnet's view of equivocation (p. 315), we must refer to Mr. Jardine's curious account of Garnet's trial. ('Criminal Trials,' vol. ii.) The guilt of both prisoners was proved: Garnet was hanged in May 1606, in the city of London; Oldcorne had been executed at Worcester in the preceding month. They were both considered martyrs by the Roman Catholics.

It is certain that more English Jesuits than we have named were at least aware, if they did not take a part in the conspiracy of the Powder Plot. It is also probable that there were persons upon the Continent who, through Fawkes, Bayham, or other conspirators, had become acquainted with the intended treason. But it does not appear that any body of Jesuits, either at home or abroad, were formally led to expect that an attempt was to be made to restore the Roman Catholics to power; much less by what means the attempt would be made.

GARNIER, JEAN JAQUES, was born in 1729, in the province of Maine, of poor parents, who gave him however a superior education. At the age of eighteen he left his home and travelled on foot to Paris, where a happy chance made him acquainted with the sub-principal of the college of Harcourt, who perceiving his uncommon talents and acquirements, took him under his patronage, and procured him a situation at the college. About 1760 he was appointed professor of Hebrew at the Collège de France, of which he afterwards became inspector. On the death of Villaret in 1766 he was appointed historiographer of France, in which capacity he published in 1770 the ninth volume, in 4to, of Velly and Villaret's 'History of France,' beginning with the year 1469. Continuing his labours on this work, he produced the thirteenth volume, which brings the history of France down to the middle of the reign of Charles IX. He was also the author of the following works: 'L'Homme des Lettres,' Paris, 1764, 2 vols., in 12mo, in which he lays down an ingenious method for forming a man of letters; 'Traité de l'Origine du Gouvernement François,' Paris, 1765, 12mo; 'Le Commerce remis à sa Place,' 1757, 12mo; 'Le Bâtard Légitime, ou le Triomphe du Comique Larmoyant,' 1757, 12mo. He likewise wrote several papers in the 'Memoirs of the Academy of Inscriptions;' and among other subjects, on the philosophy of the ancients, and especially on that of Plato, of which he was a great admirer. Garnier died in 1805, at the age of seventy-five.

GAROFALO, the name by which Benvenuto Tisio is commonly known, apparently from his adoption of a gilliflowers (garofalo) for his monogram. Garofalo is the most distinguished of the Ferrarese painters: he belongs however to the Roman school. He was born in the Ferrarese in 1481, and was first instructed in design by Domenico Pannetti, from whom he went to his uncle Niccolò Soriani at Cremona. After the death of his uncle in 1499, he left Cremona and repaired in 1500 to Rome, where he remained fifteen months with Giovanni

Baldini, and after visiting several other cities, he spent two years with Lorenzo Costa at Mantua; he then dwelt for a period of four years in Ferrara, and finally engaged himself with Raffaele in Rome in 1508 (1505 in Vasari as a misprint, as the stated intervals evidently show).

Raffaele's great powers and personal qualities excited in Garofalo, as in other painters, a species of enthusiastic veneration for him; and Garofalo ever afterwards was a studious imitator of his style, even in his small works. He remained some years with Raffaele in Rome, when he was called by domestic affairs to Ferrara. He intended to return to Raffaele, but circumstances kept him in Ferrara. He was employed at Belriguardo and elsewhere on extensive works, together with the two Dossi, by the Duke Alfonso I. He executed many excellent frescoes in Ferrara—the principal of which were those of 'San Francesco,' the 'Slaughter of the Innocents,' the 'Resurrection of Lazarus,' and others, painted about 1519-24: they still exist. There are also some excellent frescoes by him still preserved in the Palazzo del Magistrato. Garofalo's oil-paintings are frequent in picture-galleries: there are many at Rome in the Borghese gallery and in the Ghigi and Doria palaces; there are also some good specimens of his style in the galleries of Dresden and St. Petersburg, and there are two small pictures of average merit in the National Gallery—a 'Vision of St. Augustine' and a 'Holy Family.' His small pictures are very numerous: he appears to have had a predilection for small proportions; and with regard to these works, what Ælian ('Var. Hist., iv. 3) says of Dionysius of Colophon respecting Polygnotus may be said of Garofalo respecting Raffaele—he imitated his art in every respect except size. Garofalo however, though he imitated, did not equal Raffaele even in technical practice, except perhaps in colour. He is more intense and more true in local tints than Raffaele—his red and green draperies are remarkably pure, and are quite fresh even to this day—but in execution generally he is dry; his works are crude in effect, and have much of the 'quattrocentismo,' or that crudity and dryness of design which characterise the majority of the works of the 15th century. Though he was very successful in the execution of the distinct objects or features of his works independently, he failed in uniting the parts—in harmonising the whole: he wants aerial perspective and tone. He died in 1559, having been for the last few years of his life quite blind.

(Vasari, *Vite de' Pittori, &c.*; Lanzi, *Storia Pittorica, &c.*)

GARRICK, DAVID, descended from a French Protestant family of the name of Garric, or Garrique, was born on the 20th of February 1716, at the Angel Inn, Hereford. His father was Captain Peter Garrick, of the Old Buffs, then recruiting in that city, and his mother, whose maiden name was Arabella Clough, was the daughter of one of the vicars of Lichfield Cathedral. At ten years of age he was placed under the care of Mr. Hunter, master of the grammar-school of Lichfield; and in 1727 showed his predilection for the stage by performing *Serjeant Kite*, in Farquhar's comedy of the 'Recruiting Officer.' Shortly afterwards he went to Lisbon on a visit to his uncle, a wine-merchant there, and by his agreeable manners became a great favourite not only with the English residents, but amongst the young Portuguese nobility. In the following year he returned to school at Lichfield, and during occasional visits to London encouraged his growing passion for theatricals. In 1735 he became the pupil of Dr. (then Mr.) Samuel Johnson, with whom, on the 2nd of March 1736, he set out for the metropolis, and on the 9th of the same month entered himself in the Society of Lincoln's Inn. In 1737 he commenced a course of studies under Mr. Colson, the mathematician, at Rochester.

Shortly afterwards, on the death of his father, he commenced business as a wine-merchant, in partnership with his elder brother, Peter Garrick. This partnership was however soon dissolved, and in 1741 David Garrick finally resolved upon the profession of the stage, and made his first appearance at Ipswich under the name of Lyddal, and in the part of Aboan, in the tragedy of 'Oroonoko.' His success was undoubted, and he soon became a great favourite in that town, playing not only tragedy and comedy, but exhibiting his grace, humour, and agility as harlequin. In the autumn he returned to London with the manager of the Ipswich company, who was also proprietor of the theatre in Goodman's Fields; and on the boards of that establishment Mr. Garrick made his first appearance as Richard III., October 19th, 1741. The fame of the young actor, then only in his twenty-sixth year, spread in a few weeks throughout the metropolis; and from the time of his first benefit, December 2nd, on which occasion he performed *Lothario*, in 'The Fair Penitent,' persons of every condition flocked from all parts of the town to see him, and entirely deserted the theatres at the West-end. At the close of the season, May 26, 1742, Mr. Garrick played three nights at Drury Lane Theatre, as *Bayes*, *Lear*, and *Richard*, and then set off for Dublin, accompanied by Mrs. Woffington. In Ireland he sustained his reputation, and the theatre was crowded to such a degree as, in conjunction with the heat of the weather, to produce an epidemic, which was called the *Garrick fever*. He returned to London for the winter season, and commenced an engagement at Drury Lane on the 5th of October, as Chamont, in Otway's tragedy of 'The Orphan.' In 1745 he again visited Dublin, and became joint manager, with Mr. Sheridan, of the Theatre Royal in Smock Alley. In 1746 he returned to England,

ELOG. DIV. VOL. III.

and was engaged for the season by Mr. Rich, the patentee of Covent Garden Theatre, on the close of which he purchased, in conjunction with Mr. Lacy, the Theatre Royal, Drury Lane (Mr. Fleetwood's patent having expired), and opened it on the 15th of September 1747 with the play of 'The Merchant of Venice,' to which he spoke the well-known prologue written by Dr. Johnson.

On the 22nd of June 1749, Mr. Garrick married Eva-Maria Violette, the daughter of a respectable citizen of Vienna, who having been educated as a dancer, had made her first appearance at Drury Lane on the 3rd of December 1746. Her real family name was Veigel, which in the Viennese patois signifies Violet, and she assumed the name of Violette by command of the empress Maria Theresa.

On the 7th of September 1769, Garrick put into execution his favourite scheme of the Jubilee in honour of Shakspeare, at Stratford-upon-Avon, and produced a pageant on the subject at Drury Lane in the following October. On the 10th of June 1776, having managed Drury Lane Theatre for twenty-nine years (with the exception of two passed abroad, 1763 and 1764), Garrick took his leave of the stage in the character of Don Felix, in 'The Wonder,' the performances being for the benefit of the fund for decayed actors. In 1777 Mr. Garrick was honoured by the command of their majesties King George III. and Queen Charlotte to read a play at Buckingham House. He selected his own farce of 'Lethe,' introducing for the occasion the character of an ungrateful Jew; but having been so long accustomed to the thunders of applause in a theatre, the refined approbation of the royal party threw, to use his own expression, "a wet blanket" over him. In the same year he was put into the commission of the peace.

At Christmas 1778, while on a visit to Lord Spencer, at Althorpe, he had a severe fit, from which he only recovered sufficiently to enable him to return to town, and expired January 20th, 1779, at his own house in the Adelphi, having nearly completed his 63rd year. He was buried with great pomp in Westminster Abbey on the 1st of February.

As an actor, Mr. Garrick's merits may be considered as summed up in the forcible words of Pope to Lord Orrery on witnessing the performance of Richard:—"That young man never had his equal as an actor, and will never have a rival." As yet the prophecy is unshaken. Garrick was an excellent husband, a kind master, and a matchless companion. The charge of avarice so frequently made against him is disproved by a careful examination of his life. He was one of the most accomplished men of his day; and although his literary reputation is merged in the splendour of his histrionic fame, his rank as a writer of prologues and epilogues, and in the lighter kinds of verse, must be generally acknowledged as considerable. His alterations and adaptations of popular English and French plays were numerous and successful, and, with the addition of his original contributions to the drama, exceed forty. The best known to the present generation of play-goers is the farce of 'The Lying Valet,' and the comedy of 'The Clandestine Marriage,' of which latter he was joint author with the elder Colman.

Mrs. Garrick survived her husband forty-three years, and expired suddenly in her chair after a short indisposition, at her house in the Adelphi, on the 16th of October 1822, in the 98th year of her age, having retained her faculties to the last.

Garrick's private correspondence, with a new biographical memoir, was published in 2 vols. 4to, London, 1831.

GARTH, SAMUEL, eminent as a physician and a wit, during the reigns of William III. and Anne, was descended of a good Yorkshire family, received his academical education at Peterhouse, Cambridge, and graduated as M.D. in 1691. Having settled in London, he rendered himself distinguished by his conversational powers, which recommended and set off his professional skill, and soon acquired very extensive practice. Being a zealous Whig, he became intimate with the wits and great men of the Whig party. At the accession of the house of Hanover he obtained his reward in the honour of knighthood, and in the offices of physician in ordinary to George I., and physician-general to the army. He died January 18, 1718.

Garth is known in our literary history as the author of a mock-heroic poem called 'The Dispensary.' It arose out of a quarrel between the College of Physicians and the Corporation of Apothecaries, concerning the establishment of a (then) new charity, for the gratuitous distribution of advice and medicine to the poor. To this the apothecaries strongly objected, as being injurious to their business. Garth, a strong supporter of the dispensary, wrote his poem to satirise its opponents, and recommend the scheme to the public. It is written with a competent share of spirit and elegance, and obtained popularity. But the introduction of the supernatural machinery of the ancient epic, and the imitation of Homer's battle-scenes, are so extravagant and incongruous when pressed into the account of a medical squabble of the 17th century, that a poem of near 2000 lines, of which they form the staple, could not be expected to keep its ground when the temporary interest of its subject passed away: accordingly, it has long ceased to find readers. Garth's other original poems consist of occasional pieces, prologues, epilogues, and the like. He superintended a translation of Ovid's 'Metamorphoses,' by various hands, among whom were an unusual number of eminent men. Dryden contributed the first, twelfth, and many portions of other books; Addison, the

second and third; Gay, Pope, Congreve, Rowe, and other less distinguished men were also concerned. Garth himself contributed the fourteenth and part of the fifteenth book, with a critical preface, slightly noticed by Dr. Johnson.

GARVE, CHRISTIAN, was born at Breslau in the year 1742. At an early age he lost his father, and he was indebted for his education to the solicitude of his mother. He attended the gymnasium at Breslau, and was designed for the church, which however on account of the delicate state of his health, he never entered. In 1760 he attended the high school at Halle for the purpose of studying mathematics and philosophy, which studies he continued to pursue at the university of Leipzig, when Gellert, Weisse, and others were his friends. He returned to his mother's house at Breslau in 1767, and studied so hard as to injure his naturally weak constitution, and to bring on a hypochondriacal temperament. On the death of Gellert in 1769, Garve was called to Leipzig to fill the vacant professorship, and he read lectures on pure mathematics and logic as long as his declining health would allow, till at last he was obliged to resign his office, and return to his native town, where he was a private teacher for nearly the remainder of his life. A translation of Burke 'On the Sublime and Beautiful,' and of other English works, first made him known to the literary world; and his 'Philosophical Treatises' ('*Philosophische Abhandlungen*'), published in 1779, gained him such reputation that Frederick the Great invited him to Charlottenburg and treated him with marked respect. At the suggestion of the king he published an edition of Cicero's 'Offices,' which appeared in 1783, and went through four editions. Garve's last years were passed in great misery. He bore his sufferings with the most exemplary fortitude, and died in 1798.

Garve is one of those writers who were called philosophers before German philosophy had assumed that peculiar character which it bears at present. His treatises are in a popular style, and are on subjects of general and practical interest, such as 'patience under calamity,' the 'advantages of a moral life,' and so on. Garve translated the 'Politik,' 'Ethica,' and 'Rhetoric' of Aristotle into German; these translations, though not without their merits, by no means present a faithful counterpart of the originals.

GASCOIGNE, GEORGE, was the son of Sir John Gascoigne, the head of an ancient family in Essex. The date of his birth is uncertain; but it was not later, and may have been earlier, than the year 1537. He was educated at Cambridge, and afterwards entered at Gray's Inn as a student of law; but his youthful prodigality caused his father to disinherit him, as far as it was possible to do so. Upon this, having endeavoured in vain to obtain employment at home, he embarked for Holland, and took service as a soldier of fortune under William, Prince of Orange, whose favour he gained in two years of hard warfare. At the end of this time he was one of five hundred Englishmen who, being left to garrison the indefensible fort of Falkenburg, fought their way to the walls of Leyden during its siege, but being refused admittance, were compelled to surrender to the Spaniards. Their lives were spared; and they were sent home to England after being kept four months as prisoners. Here Gascoigne resumed the study of the law, but never prosecuted the profession seriously or with success; and he appears to have possessed means sufficient for his subsistence, although we read of his having been at one time, towards the close of his life, a prisoner in the Compter. He married (it is said) a Scottish lady whom he met in France; and usually resided at Walthamstow in his native county, where gardening and literary composition were his chief employments. In 1575, having been introduced to Queen Elizabeth, he attended one of her progresses; and at Kenilworth, on that occasion, he recited verses before her, and wrote an account of the pageantrie. It will be recollected what use Sir Walter Scott has made of this incident. He died of some slow disease, at Stamford, on the 7th of October 1577, commending his wife and child to the bounty of the queen.

The earliest of Gascoigne's printed volumes bears date 1572; and his works were collected ten years after his death, in a volume bearing this title: 'The whole Workes of George Gascoigne, Esquyre: newly copyuled into one volume: that is to say, His Flowers, Hearbes, Weedes; the Fruits of Warre; the Comedie called Supposes; the Tragedie of Iocasta; the Steel Glasse; the Complaynt of Phylomene; the Storie of Ferdinando Ieronimi; and the Princelye Pleasures of Kenelworth Castle,' London, 1587, 4to, black letter. The chief among his non-dramatic poems is the satire called 'The Steel Glasse,' written in blank verse, and first printed in 1576. This poem, with the 'Fruits of Warre' (which gives many particulars of the author's life), and several other specimens of his poetry, are reprinted in Southey's 'Select Works of the British Poets, from Chaucer to Jonson,' 1831; and either from those, or from pieces given by Campbell and others, a notion may be formed of the serious ethical tone of feeling, the frequency of familiar illustration, and the antique and half-all-goric cast of imagery, which distinguish the works of this interesting old poet. His prose 'Notes of instruction concerning the making of verse,' have been reprinted by Mr. Hailewood, in his 'Ancient Critical Essays upon English Poets and Poetry,' 1815. Gascoigne holds likewise a place in the history of the English drama. His comedy of 'The Supposes,' a free translation from 'Gli Suppositi,' of Ariosto, was first performed by the gentlemen of Gray's

Inn in 1566; and is the earliest prose play existing in the language: its chief importance arises from the use supposed to have been made of it in 'The Taming of the Shrew.' The 'Iocasta,' first played at the same place and in the same year as 'The Supposes,' is founded upon the 'Phonissos' of Euripides, of which however it is an alteration, rather than a translation. Three authors had part in it, Gascoigne, Francis Kinwelmarsh, and Christopher Yolverton, Gascoigne working on the second, third, and fifth acts. Some specimens of it, with a short critical estimate, will be found in Collier's 'History of English Dramatic Poetry.' It is mainly curious as having been the second drama in blank verse which was composed in our language. Mr. Collier gives also an account of another dramatic piece of Gascoigne, 'The Glasse of Government,' first printed in 1575, which possesses very little merit.

GASCOYNE, WILLIAM, who was born about 1621, and who was killed while fighting for Charles I. at Marston Moor, July 2, 1644, was distinguished by having been the first inventor of the micrometer (about 1641). The instrument appears to have originally consisted either of two parallel wires, or of two plates of metal, placed in the focus of the eye-glass of a telescope: the nearest edges of the plates, which were ground fine, were parallel to one another; and the plates or the wires were capable of being moved, so that the image of an object could be exactly comprehended between them: a scale served for the measurement of the angle subtended by the interval, and Gascoigne is said to have used this instrument for the purpose of measuring the diameters of the moon and planets, and also for determining the magnitudes or distances of terrestrial objects.

*GASKELL, MRS. ELIZABETH C., authoress, wife of the Rev. William Gaskell, Unitarian minister, resident at Manchester. This lady differs from most authoresses in many respects. She did not commence literary pursuits, or rather, did not cultivate literature actively, until comparatively late in life. Her works are not composed of those grave experiences of life at eighteen where the world, in evening dress, is surveyed through an opera-glass. Nor does Mrs. Gaskell interfere with the graver descriptions of politics. In her own words, she "understands nothing of Political Economy." Her position, as wife of a minister, gave opportunity for the study of all classes of society; and especially for the contrasts between the rich and the poor. Her observations have formed the basis of a series of fictions in which the social character and condition of the manufacturing districts in the 19th century are most forcibly described; and in which the necessity for reform is dramatically inculcated, whilst plans for effecting it are wisely left to other hands. Mrs. Gaskell's first novel, 'Mary Barton,' published in 1848, is a striking view of a state of society which is already to some extent passing away. A 'Tale of Manchester Life,' it represents the struggles between the mill-owners and the workmen, showing especially the evils that result from strikes, and the causes which lead to them. Mrs. Gaskell thinks that the operatives, through extreme ignorance induced by poverty and wretchedness, cannot understand how a master may become more and more wealthy, year by year, without wronging those by whose labour their fortunes are made. They do not understand the rights and the pains of capital; but, on the other hand, the masters do not always understand its duties. 'Mary Barton' at once placed its authoress in a very high position amongst the writers of the highest class of fiction. Four editions have been followed by one in a cheap form. For several years after this Mrs. Gaskell devoted herself to periodical literature. She had previously contributed to 'Howitt's Journal,' and other magazines; and, on the establishment of 'Household Words,' she became one of its most constant and valued writers. 'The Moorland Cottage,' a Christmas story, was published in the winter of 1850; and her second novel, 'Ruth,' early in 1853. In 1855 Mrs. Gaskell published 'North and South,' a novel, reprinted and almost rewritten from 'Household Words.' From the same source have also been collected the series of papers entitled 'Cranford,' and 'Lizzie Leigh,' &c. All have enjoyed great popularity, and, like the novels, are now accessible in a cheap form. 'Cranford,' especially is noticeable; depicting the life of a village—an old subject treated in a very novel manner: a village inhabited exclusively by single ladies or widows, all of limited means; and whose various characteristics, idiosyncracies, peculiarities, or eccentricities, are given with a quaint, sometimes melancholy, humour. Mrs. Gaskell has also contributed to the 'Daily News,' amongst other occasional matter, a memoir of her lamented friend, Miss Brontë (Currer Bell), and this subject, in an extended work, is now occupying her attention.

GASSE, STEFANO AND LUIGI, twin brothers, and both architects, were born at Naples, August 8, 1778, but were of French origin. When not above seven years of age they were sent to Paris, and there confined to the care and instruction of their maternal uncle the Abbate Minotti. On their education being sufficiently advanced, they made choice of architecture as their profession; and they not only obtained many premiums at the Institute of France, but were sent to complete their studies at Rome. After remaining five years at Rome, they were in 1802 recalled by their parents to Naples, where they settled and practised together. The strong attachment between the two brothers was interrupted only by the death of Luigi (November 11, 1833); and they appear to have been well suited to

aid each other, no less by the difference of their talents than by the similarity of their dispositions—Luigi possessing greater fertility of ideas and readiness in design, while Stefano had more practical skill and knowledge of construction. Thus, the works executed by Stefano during the lifetime of Luigi, belong to both brothers in common; and Naples owes to them many of its best modern edifices. Among the the more important of them are—the Astronomical Observatory; the additions to the Villa Reale; the Reale Edificio di San Giacomo, an immense pile of building, erected at the cost of 1,500,000 ducats, and containing the bank, exchange, prefecture, and a great number of other public offices; and the Dogana, or new custom-house. Besides these public works Stefano built not a few mansions for private individuals: the Palazzo Montemiletto; that of the Duca di Terranova, the Casino Cacace at Sorrento; the Casino Dupont, and that called 'di Sofia,' in the Strada Nuova di Posilipo. He also designed the new streets Santa Lucia and Mergellina, and the entrance to the new Campo Santo or public cemetery, but he did not live to complete any of these last-mentioned improvements. After a short illness the Cavaliere Stefano Gasse—for he had been complimented with the cross of the order of Francesco Primo—died at Naples, February 21st, 1840.

GASSENDI, PIERRE (properly GASSEND), one of the most distinguished of the naturalists, mathematicians, and philosophers of France, was born 22nd of January 1592, at Chantersier, a village near Digne, in the department of the Lower Alps, of poor parents. Richer in virtue than in worldly goods, they were content to sacrifice their own enjoyments to the education of their child, who, before he reached his fifth year, had already given many premature indications of extraordinary powers. At a very early period he evinced a taste for astronomy, which became so strong, that he is said to have often deprived himself of sleep in order to enjoy the contemplation of the heavens; and the following anecdote betokens the precocious development of that talent of observation and deduction for which he was in after-life so eminently distinguished. A dispute having arisen one evening between some children of his own age whether the moon or clouds were moving, and his companions maintaining that the apparent motion was that of the moon, but that the clouds were stationary, Gassendi proceeded to undeceive them by ocular proof: placing his playfellows beneath a tree, he bade them notice that while the moon was steadily visible between the same branches, different clouds were constantly appearing in succession.

Gassendi was sent to school at Digne, where he made rapid progress in the Latin language, and soon acquired a decided pre-eminence over his schoolfellows. Upon completing the usual course, he returned to Chantersier in order to prosecute his studies in retirement; but he had not been there long when he was invited, at the early age of sixteen, to teach rhetoric at Digne. This office he shortly relinquished, and proceeded to Aix to study divinity. In 1614 he was appointed professor of theology at Digne, and two years afterwards he was invited to Aix to fill the chairs of divinity and philosophy, vacant by the death of Fesac, his master and teacher.

The careful perusal of the works of Vives, Ramus, and Patricius, had thoroughly convinced Gassendi of the faults and defects of the philosophy of the schoolmen, or the so-called followers of Aristotle, but it required no ordinary boldness to call it in question. Animated however by the spirit of truth and free inquiry, Gassendi did not hesitate to submit the principles of the schoolmen to a rigorous and searching criticism, and considered it his duty, as a professor of philosophy, to expose the errors of the prevailing theory. This he did indirectly in a work entitled 'Exercitationes paradoxice adversus Aristoteles.' The appearance of the first volume, which was published at Grenoble in 1624, gained for its author a well-established and wide-spread reputation; and if on the one hand it gave great offence to the blind partisans of established doctrines, it was on the other highly esteemed by several learned and distinguished individuals, and particularly by Nicholas Peiresc, president of the University of Aix, by whose interest and influence, assisted by Joseph Walter, prior of Valette, Gassendi was promoted to a canonry in the cathedral of Digne, where he was admitted to the degree of doctor in divinity, and appointed prévôt of the church. This new situation, which enabled him to vacate the chair at Aix, allowed to Gassendi the undisturbed disposition of his time, which he devoted to the diligent prosecution and advancement of astronomy and anatomy, and to the study of classical literature, and of the works of the ancient philosophers. As the result of his anatomical researches, he composed a treatise to prove that man was intended to live upon vegetables, and that animal food, as contrary to the human constitution, is baneful and unwholesome. In 1629 a second volume of his 'Exercitationes' appeared, the object of which was to expose the futility of the Aristotelian scholastic logic. At the same time five more volumes, in further consideration of the same subject, were announced; but in consequence of the bitter hostility which his attacks upon the favourite system had awakened in its advocates, Gassendi deemed it prudent to abandon the design.

In 1628 Gassendi visited Holland with a view to cultivate an acquaintance with the philosophers of that country. During his residence there he composed, at the instance of his friend Mersenne, the work entitled 'Examen philosophicum Rob^t. Fludd,'

in answer to the dissertation of our countryman on the subject of the Mosaic philosophy. Upon his return to Digne, Gassendi applied himself with great diligence to astronomical studies, for which his fondness had grown with his years, and he had the good fortune, on the 7th of November 1631, to be the first to observe a transit of the planet Mercury over the sun's disc which had been previously calculated by Kepler.

In the year 1641, being called to Paris by a law-suit arising out of the affairs of the chapter, his amiable disposition and brilliant talents obtained for Gassendi the regard and esteem of the most distinguished persons of the metropolis of France, and the friendship of the Cardinal Richelieu and of his brother the Cardinal du Plessis, archbishop of Lyon. At this period Des Cartes, with whom Gassendi had long maintained a close and friendly intercourse, was working a reform in philosophy, and by the publication of his 'Meditationes' had opened for it a new and more useful career. In this work however Gassendi discovered much that was objectionable, and forthwith attacked the philosophical system of his friend in a work entitled 'Disquisitio Metaphysica, seu Dubitationes ad Meditationes Cartesii,' which was put into the hands of Des Cartes by their mutual friend Mersenne. Des Cartes wrote an answer, which he published together with the 'Doubts,' under the head, 'Sixth Objection to the Meditations.' In 1643 Gassendi composed the 'Instantiæ' in reply, and circulated them in manuscript in Paris before he sent them to M. Sorbière to be printed at Amsterdam. The latter circumstance tended to confirm and widen the difference which, in the course of the controversy, had grown up between the two friends, who however entertained a sincere respect for each other, and were eventually reconciled by the kindly offices of a common friend, the Abbé d'Estrées. Baillet, the biographer of Des Cartes, ascribes the publication of the 'Doubts' to secret jealousy of the growing fame of the author of the 'Meditationes,' and to chagrin on the part of Gassendi at the omission in Des Cartes's Treatise of Meteors of his Dissertation upon the singular phenomenon of two parhelia which had been observed at Rome. But the mind of Gassendi seems to have been superior to the influence of such paltry motives, and the origin of the work in question may more justly be referred to the love of truth, which to Gassendi was dearer than friendship itself. Moreover, there was much in their respective characters that was calculated to lead to difference of opinion upon speculative matters. Carried away by a lively imagination, Des Cartes thought it sufficient to draw from his own mind and his individual consciousness the materials for constructing a new system of philosophy; whereas Gassendi, a man of immense learning, and the declared enemy of whatever had the appearance of novelty, was strongly biased in favour of antiquity. Chimæra for chimæra, he preferred that which had at least the prescription of 2000 years in its favour. From Democritus and Epicurus, whose opinions were above all others most easily reconcilable with his own scientific information, Gassendi drew whatever was well-founded and rational in their system to form the basis of his own physiology. Having restored the doctrine of Atoms and a Void with such slight modification, that at most perhaps he did but lend to it a modern style and language, his philosophy had the glory of dividing with Des Cartes the empire of the French philosophical world.

In 1645 Gassendi was appointed professor of mathematics in the College Royal of Paris, upon the nomination and by the influence of Cardinal du Plessis. As this institution was intended principally for the advancement of astronomy, he read lectures upon that science to a crowded and distinguished audience, by which he increased the reputation he had previously acquired, and quickly became the focus of the literary activity of France, so far as it was directed to his favourite sciences of mathematics and astronomy.

But the intensity of his studies had undermined the constitution of Gassendi, and a severe cold having occasioned inflammation of the lungs, he was forced to retire to Digne for the restoration of his health. In this retirement however he was far from idle. In 1647 he published his principal work, 'De Vita et Moribus Epicuri,' in which he clears the character of this philosopher from the mist of prejudice with which it had been invested and unfairly handed down to posterity. The 'Syntagma Philosophiæ Epicuri,' which followed in 1649, is an attempt to reconstruct the system of Epicurus out of the extant fragments, and to give a complete and connected exposition of his theory. Notwithstanding the express refutation, which Gassendi subjoined, of the errors, both physical and moral, of this philosopher, and despite the purity of his own moral character and the exactitude of his religious observances, the sincerity of his religious belief was doubted by those who were constrained to admit the learning and critical acuteness which the work displayed; eventually however the injustice of the calumny redounded to the disgrace of his envious traducers.

His native air having produced a considerable amelioration in his strength, Gassendi was able to return to Paris in 1653, and the next year he published 'Tychonis Braheii, Copernici, Peurbachii, &c. Vita,' a work which was not confined to the biography of these great men, but also contained a brief sketch of ancient and modern astronomy down to his own day. The resumption of his literary labours quickly brought on a return of his former disorder, and he died on the 14th of October 1655, in the sixty-third year of his age. His valuable

collection of books and his astronomical and philosophical apparatus were purchased by the Emperor Ferdinand III, and deposited in the Imperial Library at Vienna.

The philosophical reserve and moderation of Gassendi have led Bayle to designate him as a sceptic, which however, to judge at least from his writings, is little in accordance with the spirit of his philosophy; for although he often complains of the weakness of human reason, which even in the sphere of physical investigations is constantly at fault, and therefore admits the insufficiency of his own discoveries to satisfy either himself or others, this circumstance, while it rendered him patient in controversy and unwilling to enforce his own conclusions upon others, only proves at most that his dogmatism was not as one-sided and immoderate as that of other dogmatists, and that even while he insisted upon the possibility of establishing positive results, he was yet sceptical enough to doubt the finality of his own positions.

By the philosophical cast of his mind and the variety of his acquirements, as well as by the amiable moderation of his character, Gassendi was one of the brightest ornaments of his age. Bayle has justly styled him the greatest philosopher among scholars, and the greatest scholar among philosophers. He may have been surpassed by some of his contemporaries in particular departments of inquiry, as, for instance, by Des Cartes, in the higher branches of mathematics, yet none came near to him in reach and universality of genius. Varied as was his erudition, it did not overpower the clearness of his intellect, the too common result of great learning; on the contrary, his works are distinguished for the perspicuous arrangement of the ideas, the justice of the reasoning, the acuteness of the criticism, and the pre-eminent lucidness of the style and diction.

The works of Gassendi were collected by Montmort and Sorbière, 6 vols. fol., Lyon, 1658, and by Averrani, 6 vols. fol., Firenze, 1728. There is a life of Gassendi by Sorbière, prefixed to the collected works, and one by Bougerel, Paris, 1737.

GATAKER, THOMAS, born in London in 1574, studied at Cambridge, where he took his degrees, was afterwards chaplain to Sir William Cook, and also preacher to the Society of Lincoln's Inn. He applied himself especially to the study of the Scriptures in the Hebrew and Greek text, and wrote several works in illustration of the Old Testament. He also wrote 'Of the Nature and Use of Lots,' a treatise historical and theological, in which he distinguishes between innocent and lawful games of chance and those which are unlawful or reprehensible. His arguments having been misrepresented, he had to sustain a polemical correspondence in his own justification. In 1611 he was appointed rector of Rotherhithe. In 1624 he wrote a treatise against Transubstantiation. In 1642 he was chosen to sit in the Assembly of Divines at Westminster, where in several instances he differed from the majority. He afterwards wrote with others the 'Annotations on the Bible,' which were published by the same Assembly; the Notes on Isaiah and Jeremiah are by him. In 1648 Gataker, with other London clergymen, to the number of forty-seven, remonstrated against the measures taken by the Long Parliament with respect to King Charles, and he became in consequence an object of suspicion to the ruling powers, but by his mild and open conduct he escaped personal annoyance. In 1652 he published a Latin translation of M. Aurelius's 'Meditations,' with valuable notes, tables of reference, and a preliminary discourse on the philosophy of the Stoics. In the latter part of his life he had to sustain a controversy against the pretended astrologer William Lilly. He died above eighty years of age. His son Charles published his 'Opera Critica,' 2 vols. folio, Utrecht, 1698, which contain, besides the 'Meditations,' his 'Cinnus' and 'Adversaria Miscellanea,' being disquisitions on biblical subjects, and 'De Novi Testamenti Stylo,' a philological treatise on the ancient languages.

GATES, HORATIO, an American general of the Revolutionary war, was born in England in 1728. He received his military training in the English army, served in the West Indies, and accompanied General Braddock in his disastrous expedition against the French settlements on the Ohio in 1755. [BRADDOCK.] Being wounded in that affair, and obliged for a time to retire from active service, he purchased an estate in Virginia. He took the popular side in the Revolutionary troubles, and was appointed adjutant-general on the breaking out of the war. In 1776 he was sent to command the army on Lake Champlain. His conduct at first was not approved of, inasmuch that he was superseded in the spring of 1777; but in the following August he was appointed to oppose General Burgoyne, who had forced his way from the Canadian frontier to the Hudson. An indecisive battle took place on the 18th of September, and a second on the 8th of October, in which the British were defeated. General Gates then blockaded his adversary at Saratoga, who, being disappointed in his hope of forming a junction with the Royalist troops on the Hudson, and cut off from all supplies, found it necessary to capitulate with his whole army.

The convention of Saratoga was one of the most important successes gained in the whole war, for nearly 6000 men surrendered on parole not to serve again, and their arms and artillery were converted to the use of the victors. Gates became the popular hero of the day; and attempts were made by some intriguing partisans, or misjudging friends, to raise him over the head of Washington. Fortunately for America these attempts came to nothing. In June 1780 he was appointed to command the southern army, which at that time was in

a wretched state of disorganisation. It is no wonder therefore that on his first meeting with the British troops (CORNWALLIS) he received, though greatly superior in numbers, a total defeat. This took place on the 16th of August, at Camden, in South Carolina. By great exertion he was again in condition to take the field, when he received news that he was superseded by General Greene, and that Congress had resolved to submit his conduct to a court of inquiry. The investigation lasted until after the close of the war in 1782: in the end he was fully and honourably acquitted of blame.

General Gates then retired to his Virginia estate, from which in 1800 he removed to New York, to the freedom of which city he was immediately admitted. In the same year he was elected a member of the state legislature. Before his departure from Virginia he performed the noblest act of his life—the emancipation of his slaves, which he accompanied with a provision for those who needed assistance. He died on the 10th of April 1806.

GATTERER, JOHANN CHRISTOPH, born in 1727, near Nurnberg, became professor of history at Göttingen, where he published numerous useful works on ancient history, geography, chronology, genealogy, heraldry, and diplomacy, on all which subjects his information was very extensive. His principal publications are—1. 'Elementa artis Diplomatie Universalis,' 4to, Göttingen, 1765, a work of great and curious research, especially concerning the graphic part, or the various characters, monograms, and symbols used in old diplomacy. 2. 'Handbuch der Universal Historie,' 2 vols. 8vo, 1764-65, in which he gives catalogues of numerous writers on the history of the various countries of Europe and Asia, according to the order of time. 3. 'Stamm-tafeln zur Weltgeschichte,' 4to, 1790. 4. 'Einleitung in die Synchronistische Universal Historie,' 2 vols. 8vo, 1771, with chronological tables. 5. 'Abriss der Chronologie,' 1777. 6. 'Handbuch der Neuesten Genealogie,' 1772. 7. 'Allgemeine Historische Bibliothek,' 16 vols. 8vo, Halle, 1771. Gatterer died at Göttingen in 1779.

There was another contemporary professor, CHRISTOPH WILHELM JACOB GATTERER, at Heidelberg, who wrote several works on geology and mineralogy.

GATTI, BERNARDINO, called il Soiaro from the occupation of his father, was born at Cremona about 1495. He is one of the most distinguished of Correggio's pupils and imitators; there are several admirable works by him in Parma, Piacenza, and Cremona. The 'Miracle of the Loaves' in the refectory of the Padri Lateranensi at Cremona, painted in 1552, is a masterpiece; as is also the 'Ascension of Christ' in the church of San Sigismondo. He died in 1575. Il Soiaro is claimed by other cities, but Cremona appears to have the best title to him. (Zaist, *Notizie Istoriche dei Pittori, &c. Cremonesi; Lanzi, Storia Pittorica, &c.*)

GAUBIL, ANTHONY, a learned Jesuit, whose labours greatly advanced our knowledge of the literature of eastern Asia, was born in Languedoc in 1689. He entered the society of the Jesuits in 1704, and was sent in 1723 to China, where he applied himself to the study of the Chinese and Mantchoo languages, in which he made such proficiency that the first Chinese scholars sometimes consulted him about obscure and difficult passages in their authors. Besides the above-mentioned literary occupations Gaubil applied himself with great success to mathematics, and particularly to astronomy, without neglecting his numerous ecclesiastical avocations. Gaubil arrived in China just after the death of the celebrated emperor Ching-Tsoo, better known in Europe under the name of Kang-Hi, who was very partial to Europeans, but whose successor was imbued with a strong prejudice against the Christian missionaries. Notwithstanding this unfavourable circumstance, Gaubil succeeded in obtaining the favour of the monarch, and was nominated director of the college, where a number of Mantchoo youths are instructed in Latin and Russian, the diplomatic correspondence being, by the treaty of 1723, carried on in Latin. He was also employed as interpreter for the diplomatic correspondence between China and Russia. Notwithstanding his multifarious occupations, Gaubil found time to write several important works in China, the first of which is an 'Historical and Critical Treatise on the Chinese Astronomy,' published in the 'Observations Mathematiques, Astronomiques, Géographiques et Physiques tirées des anciens livres Chinois, ou Faites nouvellement aux Indes ou à la Chine, par les Missionnaires Jesuites, requiellées par le P. Soucier (a Jesuit),' Paris, 1729, 1 vol. 4to. The same collection contains the narrative of a 'Voyage from Peking to Canton,' by Gaubil, which has been likewise inserted by Prevot in the fifth volume of his 'History of Travels.' But the work which reflects the greatest credit on the abilities of Gaubil is his translation into French of the 'Choo-king,' which contains the earliest traditions respecting the history of China. It was published after his death by Desguignes, in 1771, at Paris. Gaubil published also a 'History of Genghis Khan and his Dynasty' (1739, Paris), which alone, according to the celebrated Chinese scholar Abel Remusat, would be sufficient to establish the reputation of the author. The other works of Gaubil are—'A Description of Peking,' and many essays on China and the adjacent countries, which are inserted in the celebrated collection published by the Jesuits under the title of 'Lettres curieuses et édifiantes,' which contains the description of the countries where they exercised their missionary labours. Gaubil died at Peking in 1759, aged seventy-one, after having resided in China thirty-six years. (*Lettres Curieuses et Edifiantes*, vol. xxxi.)

GAUDEN, JOHN, was born in 1605 at Mayland in Essex, his father being vicar of that parish. His school-education was received at Bury St. Edmunds; whence he removed to St. John's College, Cambridge, and took his degree in arts in the ordinary course. About 1630 he removed to Oxford, and became a tutor in Wadham College; and at a later period he took the degrees of Bachelor and Doctor in Divinity. In 1630 he was appointed chaplain to the Earl of Warwick, through whose patronage he received two ecclesiastical preferments, a rectory in Berkshire, and a vicarage in the county of Cambridge. In the earlier part of his history, led perhaps by the turn of his patron's politics, he inclined strongly to the popular side; and a sermon which he preached before the House of Commons, in 1640, was rewarded by a public present of a silver tankard. Next year the parliament presented him to the lucrative deanery of Bocking in Essex; to which however the cautious doctor thought it right to have his title confirmed by Archbishop Laud, then a prisoner in the Tower. After the breaking out of the civil war, Gauden submitted to the Presbyterian government, but with a hesitation which was suspicious, and which appears to have been punished by his exclusion from the Westminster Assembly of Divines after he had been named a member of that board. He gave up the use of the liturgy in the service of the church, but not till the last moment that it was possible to preserve it: and he subscribed the covenant, but not till he had written a treatise against it. He thus retained his preferments, but gradually approached nearer to the royalist church-party, and contracted with some members of it relations which, by his own account, led to important consequences. Upon the Restoration, Dr. Gauden was appointed chaplain to Charles II.; and before the close of the same year he was created bishop of Exeter, whence in 1664 he was translated to the see of Worcester. Shortly afterwards, on the 20th of September in that year, he died of a disease which was either caused or aggravated by his disappointment in being obliged to put up with the bishopric of Worcester in place of the more valuable one of Winchester, which he had very eagerly solicited.

In the course of this solicitation the assertion was made which gives interest to Bishop Gauden's history and character. He alleged that he was the real and sole author of the famous work called 'Eikon Basilike, the Portraiture of his Sacred Majesty in his Solitudes and Sufferings,' which, purporting to contain meditations and prayers composed by Charles I. in his captivity, had been published in 1648, a few days after his decapitation, and had excited a very lively sympathy towards the supposed author. The bishop's claim, urged privately in letters to Lord Clarendon and the Earl of Bristol, did not at once become the subject of open discussion; but the controversy was commenced in 1692, by an assertion of Gauden's authorship, published by a clergyman who had resided in his family. The curious question thus raised has been discussed again and again by our historical writers. An elaborate history of the controversy is given by Dr. Wordsworth in his two works upon it: 'Who wrote *Ioön Basilikè*? Considered and Answered,' 8vo, 1824; and 'King Charles the First the Author of *Ioön Basilikè*, further proved,' 8vo, 1828. Upon the merits of the controversy, it will be enough to say, that Warburton, in pronouncing doubtfully in favour of the genuineness of the work, had reason to declare the matter to be "the most uncertain he ever took pains to examine;" that in our own day, and since Dr. Wordsworth entered the field, the claim of Gauden has been strenuously supported by Mr. Hallam and by other writers of authority; and that the balance of opinion now inclines decidedly in favour of Gauden as the author.

Gauden was the acknowledged author of a large number of sermons and tracts, chiefly bearing upon questions of ecclesiastical polity. A list of these, containing nineteen or twenty pieces, is given in the article under his name in the 'Biographia Britannica.'

GAUSS, CARL FRIEDRICH, one of the most celebrated mathematicians of his day, was born at Brunswick, April 23, 1777. He displayed early such marked talent for the abstract sciences, that the Duke of Brunswick, Charles Ferdinand, undertook the charges of his education. In the thesis which he maintained in 1799, before obtaining his degree of Doctor, he evinced his talent by analysing the previous methods for proving the truth of the fundamental axioms in algebra, giving one of his own still more exact. In the same year he published his '*Demonstratio nova theorematis omnem functionem algebraicam rationalem integram unius variabilis in factores reales primi vel secundi gradus resolvi posse*:' and in 1801 this was followed by his '*Disquisitiones Arithmeticae*,' published at Leipzig, in 8vo. The last-mentioned work showed his rapid advance in the mathematical sciences. There was so much of novel speculation in this treatise as to excite some merriment among the French scientific men; but their ridicule failed to affect his reputation. In 1807 he was appointed professor of astronomy in the University of Göttingen; and in 1816 was named a privy-councillor. In the beginning of the present century the new planets were discovered, and he propounded a method for calculating their courses, in his '*Theoria motus corporum coelestium*,' published at Hamburg, in 4to, in 1809; to which Professor Paucker added, in a separate pamphlet, a geometrical formula, more definitely proving the truth of the principle of the curvilinear triangulation upon which Gauss's comparisons depended. Gauss's work greatly contributed to the succeeding more exact and useful application of the astronomical observations to which, about this time, the attention of the scientific

world began to be directed. His '*Theoria combinationis observationum erroribus minimis obnoxia*,' published at Göttingen in 1823, in 4to, with the supplement, issued in 1828 from the same place, was a great addition to scientific knowledge.

On the completion of the Göttingen observatory, Gauss devoted himself to astronomical observations. On the appointment of the government commission for extending the Danish admeasurement of an arc of the meridian to the kingdom of Hanover, he invented the means of making distant stations visible, by reflected sun-light, by an instrument known as the heliotope. Afterwards he was zealously occupied with investigations as to terrestrial or telluric magnetism, for which purpose the government caused a building to be erected for his experiments near the observatory. By the labours of himself and W. Weber, the science of telluric magnetism assumed a new and important phase. The theory was explained by them in conjunction in the Transactions of the Magnetic Union, under the title of '*Resultate aus dem Beobachtungen des Magnetischen Vereins in Jahre 1836*,' herausgegeben von C. F. Gauss und Wilhelm Weber, published at Göttingen in 1837, with another volume for 1839, published at Leipzig in 1840, with an '*Atlas des Erdmagnetismus, nach den Elementen des Theorie entworfen*.' In 1841 he published at Göttingen his '*Dioptrische Untersuchungen*' ('Dioptrical Investigations'). His latest labours were directed to the theory of geodesy, the first essay of a series upon which he published at Göttingen in 1844, under the title of '*Untersuchungen über Gegenstände der höhern Geodesie*.' In this, with a modest pride, he speaks of the trigonometrical admeasurement as "partly executed by myself, and partly under my guidance." This was contributed to the '*Transactions*' of the Royal Scientific Society at Göttingen, and appeared in the second volume. He died on February 23, 1855.

We do not attempt to give a complete list of Gauss's works: he contributed many papers to scientific publications, but the following are among the more interesting that have appeared separately, in addition to those already mentioned:—'*Methodum peculiarem elevationem poli determinandi explicat*,' Göttingen, 1808, 4to; '*Disquisitiones generales circa superficies curvas*,' Göttingen, 1828, 4to; '*Theoria residuorum biquadraticorum Commentatio prima*,' Göttingen, 1828, 4to; '*Intensitas vis magneticæ terrestris ad mensuram absolutam revocata*,' Göttingen, 1833, 4to.

* GAVARNI, the pseudonym, by which PAUL CHEVALIER, the most popular living French caricaturist, is known. He was born at Paris in 1801. Originally a mechanical draughtsman, it was not till 1835 that Gavarni began to put forth his burlesques upon persons and manners. They at once became excessively popular, and though his style and class of subjects have in the course of years varied a good deal, his popularity has never lessened. Gavarni's main object has been to depict the various phases of existing Parisian life; and this he has done with a fidelity, variety, and force which has never been equalled. His '*Gravures de Modes*' have appeared, not only in the universally known pages of the '*Charivari*,' but with equal spirit and freedom in separate issues. His '*Gens du Monde*,' '*Les Lorettes*,' '*Les Actrices*,' '*Les Artistes*,' '*Bal Masqué*,' '*Carnival à Paris*,' '*Les Enfants terribles*,' '*Les Fourberies de Femmes*,' '*Balivernes Parisiennes*,' '*Les Nuances du Sentiment*,' and a thousand others, show his facility and raciness. Yet with all this multiplication of exaggerated and burlesque representations of what is most questionable in the Parisian world by night and by day, Gavarni by his constant reference to Parisian 'nature' has kept himself from repetition, and with his never-ceasing variety, he has maintained constant gaiety, even when depicting the most equivocal scenes and circumstances. And this has largely helped to gain him his immense Parisian success. He designs for the same public for which Eugene Sue wrote; and with equal freedom, and with equal clearness, he pours trays with his pencil much the same kind of loose life which Sue describes with his pen; and suggests where he does not express the same unrestrained licence. Necessarily to any other than a Parisian he seems coarse in his mirth, strangely vulgar in his choice of subjects, and needlessly gross in his method of treating them. But the humorous artist must be judged by his own countrymen, and by the public he addresses and satirises: and so regarded Gavarni must be deemed to have succeeded, for he is in his line the prime favourite of Paris. A few years back Gavarni visited England for the purpose of sketching the wretched and the profligate classes of London; but he altogether failed in catching the features of our scoundrelism. His London sketches are always unsatisfactory, and often repulsive. Besides his original designs of life and manners, Gavarni has drawn numerous illustrations for the works of popular authors. Of these the most successful are those for the '*Juif Errant*,' &c. of Eugene Sue, and the '*Diabole à Paris*' of Balzac, in illustrating which he would of course be quite at home, and his free pencil find thoroughly genial occupation. A selection from his sketches of Parisian life, under the title of the '*Ouvres choisies de Gavarni*,' was published in 4 vols. royal 8vo, Paris, 1846, with notes by Théophile Gautier and others.

* GAVAZZI, PADRE ALESSANDRO, was born in 1803, in the city of Bologna. At the age of sixteen he became a Barnabite friar, and one of the regular clergy of the Roman Catholic Church. He was appointed professor of rhetoric at Naples, and distinguished himself by the eloquence of his lectures. His religious opinions were liberal,

and his discourses, delivered from the pulpits of various cities and towns of Italy, attracted large congregations. When Pius IX., after his accession to the papal chair in 1846, announced the liberal course of policy which he intended to adopt, and which for several months he persevered in carrying out, Father Gavazzi expressed with increased freedom his own views of political administration as well as of church government. Afterwards, when the insurrectionists of Milan, in March 1848, had driven the Austrian troops from the city, and Charles Albert, king of Sardinia, had advanced into Lombardy to support the Italian cause, Father Gavazzi harangued the people in the Pantheon and the Colosseum of Rome. An army of Roman volunteers was formed, and the pope, who thus far appeared to favour the popular cause, named Father Gavazzi chaplain-general of the forces. He accompanied the army in their short and unsuccessful campaign, stimulating the Italians to give their aid by personal services or contributions, and at the same time attending assiduously to the sick and wounded. Early in the month of August 1849 Marshal Radetzky, the Austrian general, retook Milan and defeated Charles Albert. The pope now changed his policy, recalled the army, and adopted repressive measures in Rome. Gavazzi in the meantime endeavoured to rouse the Italians in Florence and other places to resist the Austrians, but with no effective result. He repressed an insurrection against the papal government in Bologna, where he was afterwards arrested by the pope's general Zucchi, and would have been cast into prison at Corneto if, on passing through Viterbo, the inhabitants had not risen and released him. After the flight of the pope from Rome to Gaeta on the 25th of November, a provisional junta was formed, a republican government soon afterwards proclaimed, and on the 8th of February 1849 the pope was declared to be deprived of all temporal power. The pope immediately appealed to the Roman Catholic powers for assistance. The French government sent an army under General Oudinot, and on the 23rd of June 1849 the siege of the city of Rome was commenced. The Romans, commanded by Garibaldi and stimulated by Gavazzi, defended the city with great bravery, but on the 3rd of July they were compelled to surrender. Garibaldi made his escape, and General Oudinot, in consideration of Gavazzi's attention to the sick and wounded during the siege, gave him a pass of safe-conduct, which enabled him to get to England. In the spring of 1851 Father Gavazzi delivered a series of ten lectures, in Italian, in the concert-room of the Princess's theatre, London, on papal abuses, the inquisition, the character of Pius IX., clerical celibacy, and similar subjects. He has since lectured, in English, on similar topics in the chief towns of England, Wales, and Scotland, the United States of America, and in Canada.

GAY, JOHN, a lively poet of the 18th century, born at or near Barnstaple in Devonshire in 1688, began the world as apprentice to a mercer in London. That employment however he soon forsook, and having published his first piece, 'Rural Sports,' in 1711, he dedicated it to Mr. Pope, and thus established an acquaintance which ripened into a firm and lasting friendship. In 1712 he became secretary to the Duchess of Monmouth, whose service he quitted in 1714 to attend the Earl of Clarendon, ambassador to Hanover, in a similar capacity. This was his introduction to a court life. He sought and obtained the favour of the Prince of Wales, but was neglected after that prince's accession to the throne; and the disappointment of his ambition he took so seriously to heart, that it appears to have had great effect in shortening his life. This was a great weakness, for Gay ought to have possessed in himself every requisite for comfort. His writings had been lucrative, and his wit, united with the simplicity and suavity of his temper, had secured to him a large circle of attached friends, both of the noble and the witty; but his spirits were easily elated and easily depressed, and an indolent improvident temper prevented him from making the best of the advantages which he possessed. The latter years of his life were spent in the household of the Duke of Queensberry, where he was treated with great kindness and respect. He died December 4, 1732, and was buried in Westminster Abbey, where a monument, with an affectionate inscription by Pope, is erected to him.

Gay wrote several comedies and farces, of which we need only mention a mock-heroic piece, the 'What d'ye call it,' which had a great run in 1715, and may still be read with amusement; and the celebrated 'Beggar's Opera,' which was brought on the stage in November 1727, and was acted for sixty-three following nights during that season, besides obtaining similar popularity in other places. The rest of his dramas have been long forgotten. His 'Fables,' written with liveliness and elegance, are still popular with the young. The second part of them is of a political turn, and was written for the use of the infant Duke of Cumberland in 1726. The 'Shepherd's Week' is a series of pastorals, written, it is said, in rivalry of Ambrose Philips, and represents rural life in its true character of poverty and rudeness, instead of in the false colours of romance. 'Trivia, or the Art of Walking the Streets of London,' shows talent for observation, and is a clever and spirited example of the mock-heroic. Of his minor pieces, the favourite ballad of 'Black-Eyed Susan' is a good specimen.

* GAYANGOS, PASCUAL DE, an eminent Spanish and Oriental scholar, who has made many valuable contributions, both direct and indirect, to English literature, was born in Spain about the end of the 18th century. He early devoted himself to the study of the Arabic

language, without which he saw it was impossible to prosecute successfully the study of the mediæval history of Spain. When on a visit to Algiers he met with an English lady whom he married, and the most important of his published works are in the English language. An article on the 'Arabic Manuscripts in Spain,' which appeared in the 'Westminster Review' for 1834, is, we believe, the first of the series, and it has been followed by numerous articles in the 'Edinburgh,' and other reviews, in the 'Penny Cyclopædia,' the 'Biographical Dictionary of the Society for the Diffusion of Useful Knowledge,' &c. For several years Señor de Gayangos was resident in England, where his perfect knowledge of the language and literature of both countries enabled him to discharge in some sort the duties of a literary ambassador. While here he issued the 'History of the Mohammedan Dynasties in Spain,' by Ahmed Ibn Mohammed Al-Makkari, translated from the copies in the library of the British Museum, and illustrated with critical notes on the history, geography, and antiquities of Spain (London, 1840-43). The history itself is of great interest, but the main value of the work consists in the ample critical notes which occupy upwards of four hundred closely printed pages of the two quarto volumes, and which throw an entirely new light on much of the early history of Spain. Señor de Gayangos also translated the Arabic inscriptions, and wrote the illustrative matter for the magnificent work of Goury and Owen Jones on the 'Alhambra' (London, 1842, folio). Since his return to Spain, where he is Professor of Arabic at the Athenæum of Madrid, he has made repeated visits to the African coast and to England. Of late years he has rendered valuable assistance to the American historians Prescott and Ticknor, in the collection of materials for their histories of Philip II., and of Spanish literature. He has also commenced, in conjunction with Vedia, the publication of a translation of Ticknor's work into Spanish, of which the third volume has (1856) just appeared. It is enriched with copious notes, containing supplementary information to that given in the English original, and these notes have, we observe, been themselves translated in the German edition of Julius.

GAY-LUSSAC, NICOLAS-FRANÇOIS, was born at St. Leonard, in the department of Haute-Vienne, on December 6th, 1778. He was educated at the Polytechnic School, where his assiduity and talents gained him the friendship of Berthollet. On leaving the school he entered into the scientific department of Les Ponts et Chaussées. The expansibility of the gases was at that time a subject exciting much attention; and Gay-Lussac gave the law of dilatation, and showed its constant uniformity. His application to this subject led M. Charles, a scientific physician, to recommend him the use of the balloon, just previously invented, as an excellent means of testing some of his theories, of making fresh experiments, and of at least exciting public attention by his boldness and the novelty of the attempt. In conjunction with M. Biot, he made the proposal to the government; Laplace and Berthollet supported it; and M. Chaptal, then minister of the interior, gave them the balloon which had been constructed for the use of the war-department, having had it refitted at the public expense. Furnished with chronometers, thermometers, barometers, hygrometers, electrometers, compasses, and paper and pencils, Messrs. Gay-Lussac and Biot ascended from the garden of the Conservatoire des Arts et Métiers, on August 23, 1804. Their highest elevation attained was 3977 metres (13,028 feet) above the Seine. M. Biot was affected with giddiness; but Gay-Lussac, by his experiments, ascertained that the influence of terrestrial magnetism on the compass was nearly as great as on earth; that the atmospheric electricity increased as they rose, and was always negative; that the hygrometer showed increased dryness; and the thermometer, which marked 14° Réaumur (64° Fahrenheit) on earth, sank to 8½° (51°). The bold adventurers at last descended safely about 54 miles from Paris. On September 5, in the same year, M. Gay-Lussac made a second ascent alone, when he reached a height of 4½ miles; at which height he experienced a difficulty of breathing and an excessive cold, the thermometer being 6 degrees below 0 of Réaumur (20° Fahr.). He calculated that the air lost 1 degree of heat for each additional height of 174 metres (571 feet). On this occasion he brought down, in bottles carefully prepared for the purpose, some air from the highest point reached, which on analysis was found to be composed precisely the same as at the surface. After a voyage of six hours he descended at a village about 21 miles from Rouen.

M. Charles had been correct in supposing these experiments would draw attention to his friend. It introduced him to honour, titles, and illustrious friends. Of the society of Arcueil, instituted by Laplace and Berthollet in 1804, consisting at first of only nine members, Gay-Lussac was one. Here he met Alexander von Humboldt, with whom he joined in the investigation of the polarisation of light, several memoirs on which were furnished to the society. In conjunction also with Von Humboldt he endeavoured to determine the position of the magnetic equator, and its intersection with the terrestrial equator. Gay-Lussac's chief attention however was directed to the Voltaic pile, and the decomposition of acids and alkalis. Napoleon I. had instituted a magnificent prize for the most important discovery made by means of the pile, hoping that it would be gained by some one connected with the École Polytechnique, but Sir H. Davy, by his discovery of the metallic basis of soda and potassium, was the successful competitor in 1810. Bonaparte was dissatisfied; he inquired

why the members of the institute had suffered the prize to be taken by a stranger, and he was told there was no pile in France powerful enough to obtain any grand results. He ordered a colossal one to be constructed immediately, and with it Gay-Lussac and M. Thénard commenced their experiments in 1808. The result was a work in 2 vols. published in 1811, 'Recherches physico-chimiques sur la pile, sur les alcalis, sur les acides, l'analyse végétale, et animale,' &c. Their discoveries, and the improvements on methods of Davy, detailed in this work, were of great importance. In 1816 he was created Professor of Chemistry in the Polytechnic school.

Gay-Lussac's life was one of constant activity. Though he has only published two works, and those little more than pamphlets, 'Mémoire sur l'Iode,' and 'Mémoire sur le Cyanogène,' both highly esteemed, he has written more than a hundred papers on various subjects, and all of great ability. Besides the subjects already mentioned, he wrote on hygrometry, on capillary attraction, on the distinction between oxides and hydrates; and to him is due the discovery of the hydro-sulphuric and oxy-chloride acids. A course of chemical lectures delivered by him at the Sorbonne, taken down in short-hand, has been also published in two volumes.

The merits of Gay-Lussac were not unrewarded by his country. After 1830, he was repeatedly chosen a member of the Chamber of Deputies; and in 1839 he was created a peer of France. He was a member of the Academy of Sciences, honorary professor of natural philosophy at the Sorbonne, professor of chemistry at the Jardin du Roi, verificateur at the mint of works in gold and silver, editor, with M. Arago, of the 'Annales de Physique et de Chimie,' with several other official employments connected with the manufacturing industry of France. After a long life of useful labours, and in the enjoyment of excellent health till within a short period of his decease, he died on May 9, 1850, at the handsome mansion provided for him in the Jardin du Roi.

GAZA, THEODORE, a learned Greek scholar, born at Thessalonica in the early part of the 15th century, emigrated to Italy, like others of his countrymen, at the time of the fall of the Eastern empire. He found liberal patrons in his countryman Cardinal Bessarion, Pope Nicholas V., and King Alfonso of Naples. Gaza translated into Latin Aristotle's 'History of Animals;' the 'History of Plants,' by Theophrastus; the 'Aphorisms' of Hippocrates, and other Greek works. He also wrote a Greek Grammar, which was published at Rome in 1495, and was often reprinted. He was one of those who contributed powerfully to the revival of classical studies in Italy. In the then pending controversy concerning the comparative merits of Aristotle and Plato, he wrote in praise of Aristotle's opinions; but his mildness and modesty kept him within the bounds of decorum. He wrote also a book on the 'Origin of the Turks,' and a treatise 'De Mensibus Atticis.' Gaza died at Rome, or, as some say, in Calabria, at an advanced age.

GEBHARDI, a German author, born in 1699 at Brunswick, died at Lüneburg in 1764. His most important work is a 'Universal Genealogy,' published in 1730-31, in German. It is divided into three volumes, each with a particular title: the first contains the pedigree of the sovereign houses of Europe which existed in 1731; the second, the pedigrees of the extinct dynasties; the third, the genealogy of Mohammedan and heathen monarchs. This production served as a basis to all the genealogical works published by the Germans during the 18th century. Gebhardi also wrote 'Historical and Genealogical Memoirs,' 3 vols. 8vo. His son published, after his father's death, a collection of materials for a genealogical history of the reigning families of Germany, which was left in manuscript by Gebhardi.

GEDDES, ALEXANDER, LL.D., was born in 1737, at Arradowl, in the parish of Ruthven and county of Banff, Scotland. His parents, who were in humble circumstances, were enabled, by the kindness of the laird of the village, to give their son a respectable education. After spending seven years at Scalau, a Roman Catholic seminary in the Highlands, he was removed at the age of twenty-one to the Scotch college in Paris, where he diligently studied theology, and made himself master of most of the modern European languages. On his return to Scotland, he resided for some time in the house of the Earl of Traquair; and, after paying another visit to Paris, he accepted, in 1769, the charge of a Catholic congregation at Auchinhalrig, in the county of Banff, where he remained for ten years, beloved by his people, and attentive to the duties of his station. He had resolved in the early years of his life to make a new translation of the Bible into the English language, for the use of the Roman Catholics, but pecuniary difficulties prevented him during his residence at Auchinhalrig from obtaining the necessary books. On his removal to London, in 1779, he was introduced to Lord Petre, who warmly approved of his purpose, and engaged to allow him 200*l.* a year for his life, and to procure for him all the works that he considered requisite. Thus encouraged, he published in 1780 a pamphlet, under the title of an 'Idea of a New Version of the Holy Bible, for the use of the English Catholics,' in which he proposed to make the Vulgate the basis of his new translation. This plan being afterwards abandoned, he resolved to make an entirely new translation from the Hebrew and Greek. In accomplishing this work, his first object was directed to obtaining an accurate text, and no labour was spared by this indefatigable scholar to render the translation as complete as possible. He consulted the

most eminent biblical scholars of the day, among whom were Dr. Kennicott, and Dr. Lowth, the bishop of London, who assisted him with their advice. The prospectus, which contained an account of his plan, was published in 1786; this was soon followed by a letter to the Bishop of London, containing 'Queries, doubts, and difficulties, relative to a vernacular version of the Holy Scriptures,' by a specimen of the work, and by a 'General Answer to the queries, counsels, and criticisms' which his prospectus and specimens had called forth. It was not however till 1792 that the first volume of the translation was published under the title of 'The Holy Bible, or the Books accounted Sacred by the Jews and Christians, otherwise called the Books of the Old and New Covenants, faithfully translated from corrected texts of the originals, with various readings, explanatory notes, and critical remarks;' the second, which contained the translation to the end of the historical books, appeared in 1793; and the third, which contained his critical remarks upon the Pentateuch, in 1800. The remainder of the work was never finished; he was employed at the time of his death on a translation of the Psalms, which he had finished as far as the 118th Psalm, and which was published in 1807. He died at London, on the 26th of February 1802, in the sixty-fifth year of his age.

In his commentary, Dr. Geddes maintained opinions very similar to those held by that class of divines in Germany denominated 'Rationalist,' and of whom Eichhorn and Paulus were the most celebrated in his day; and his translation was made in accordance with those opinions. He considered the writers of the Scriptures to have had the same degree of inspiration which has been granted to good men in all ages, and which, according to the common meaning attached to the word inspiration, amounts to none at all. He disbelieved the divine mission of Moses, and asserted that "Moses only did what all other ancient legislators had done, required a greater or less degree of implicit obedience to their respective laws, and for that purpose feigned an intercourse with the Deity to make that obedience more palatable to the credulous multitude." He rejected the various miracles ascribed to him, or laboured to reduce them to the standard of natural phenomena. He explains the account of the creation in the book of Genesis "as a most beautiful mythos or philosophical fiction, contrived with great wisdom, and dressed up in the garb of real history." These and similar opinions exposed the author to severe censure; and charges of infidelity, and of a desire to undermine the authority of the Scriptures, were widely circulated against him. His own church was the first to condemn him; a pastoral letter, signed by three out of four of the apostolical vicars of England, forbade the faithful from reading his translation; and Dr. Geddes himself was soon afterwards deposed by the apostolical vicar of the London district from the exercise of his duties as a priest. To vindicate his character, Dr. Geddes published an 'Address to the Public on the publication of the first volume of his new translation of the Bible,' in which he most earnestly repelled the charge of infidelity. His translation, which is for the most part plain and perspicuous, but unequal, was a valuable help to the science of biblical criticism in this country; and he had the consolation, in the midst of the virulence with which he was assailed in England, to know that such men as Paulus and Eichhorn appreciated his labours.

In addition to his translation, Dr. Geddes published many other works, most of which had only a temporary interest, as they were written on the politics of the day, or on some theological or literary dispute which has long since been settled. A complete catalogue of them is given in the beginning of Dr. Mason Good's 'Memoirs of the Life and Writings of the Rev. Alexander Geddes, LL.D.,' published in 1803. (See Graves 'On the Pentateuch,' and the 4th, 14th, 19th, and 20th volumes of the 'British Critic,' old series, for a review of his theological opinions.)

GEDIKE, FRIEDRICH, was born at Boberow, near Lenzen, in Brandenburg, in the year 1754. The death of his father, when he was but nine years old, plunged him in great distress, and he was taken to the Orphan Asylum at Züllichau. In 1766, Steinbart, under whom he had studied at the asylum, founded a school of his own, where Gedike became a pupil. He went to the university at Frankfurt in 1771, and studied under Töllner. On the death of Töllner, Steinbart, who succeeded him, once more became his instructor. In 1775 Spalding appointed Gedike private teacher to his two sons, and in 1776 he was made sub-rector of the Friedrichwerder Gymnasium at Berlin, of which in a few years he became director. He now showed himself to be one of the most eminent teachers in Germany. Indefatigable in devising new methods of instruction, and constantly aiming at improvements, he animated both pupils and tutors, and raised the almost sinking establishment to a high eminence. He became in 1795 director of the Berlin Gymnasium, having previously received the degree of Doctor of Theology. He died in 1803.

The works of Gedike are chiefly school books and works on education; but he also published an edition of the 'Philoctetes' of Sophocles, and of select dialogues from Plato, as well as some translations of Pindar.

GEE, JOSHUA, was an eminent London merchant of the earlier part of the 18th century, but we have not been able to discover any particulars of his personal history. He was one of the authors of the work called 'The British Merchant,' originally published in

numbers twice a week in 1713, and afterwards collected and reprinted in 3 vols. 8vo, 1721, and again in 1743. It was set up in opposition to the commercial treaty with France which was proposed by ministers after the peace of Utrecht, and to Defoe's thrice a week paper, entitled 'Mercator, or Commerce Retrieved,' in which the treaty was defended. 'The British Merchant' contains perhaps the most complete exposition that has been given of what is called the Mercantile or Balance of Trade theory; but, independently of their systematic notions, many of the facts collected by the writers are curious and valuable, and their publication forms a record of the state of many branches of our commerce at the period when it appeared. (See a full account of it in the 'Pictorial History of England,' vol. iv. pp. 207-13.) In the preface to the republication it is stated by the editor, Mr. Charles King, that "Mr. Joshua Gee, merchant, was a very great assistant, and laboured with much industry in these papers." Gee however is best known by his separate work, entitled 'The Trade and Navigation of Great Britain considered,' which originally appeared at London in 8vo, in 1729 or 1730 (for copies of the first edition seem to have sometimes one, sometimes the other of these dates). It was reprinted at London in 8vo in 1731, and in 12mo in 1738; and there is a Glasgow edition of 1760, called on the title-page the sixth, and another in 12mo of 1767, professing to contain "many interesting Notes and Additions, by a Merchant." The book is divided into thirty-four chapters, and, besides the general principles of trade, discusses the particular commerce carried on by England with every part of the world. The two main propositions which the author attempts to make out are, "That the surest way for a nation to increase in riches is to prevent the importation of such foreign commodities as may be raised at home," and "That this kingdom is capable of raising within itself and its colonies materials for employing all our poor in those manufactures which we now import from such of our neighbours who refuse the admission of ours." In his advertisement Gee informs us that the poverty and necessity in which he had seen the poor in several parts of the kingdom had touched him very sensibly, and he had spent a great deal of time from the service of his family "to find out methods for promoting so public a blessing as turning the employment we give the poor of foreign nations to our own." His scheme however is merely to put down begging in the streets, and to employ the poor in workhouses. On the whole, the book, though it was formerly popular, is not one of any remarkable ability or value, except as giving a clear account in small space of what the trade of the country then was.

* GEEFS, GUILLAUME, the most eminent living Belgian sculptor, was the son of a baker at Antwerp, where he was born about 1805. Having studied in his native place, he went for improvement to Paris, where he was for a time in the atelier of M. Ramaye, and under whom he acquired a decidedly French manner, which however he has since to a great extent thrown off. It was at Paris that he exhibited in 1830 his first work—'A Young Herdsman of the Early Christian Times strewing Flowers on a Tomb;' but, though clever, it scarcely gave promise of the excellence which the sculptor has since attained. Almost at the outset of his career he was fortunate in having an opportunity afforded of putting forth his powers, such as does not often fall to the lot of so young a sculptor: this was to obtain, in an open competition, commissions from the Belgian government to execute a monument, which stands in the Place des Martyrs, Brussels, to the memory of the victims who fell in the struggle for Belgian independence, in September 1830; a monument to Count Frederick de Merode, in the church of St. Gudule, and a statue of General Beilliard, both of whom fell in the same struggle. These works showed a decided genius for monumental sculpture, and at once placed Geefs at the head of his profession in Belgium. They still rank among his most famous works; but he has won a high place as a poetic sculptor by his 'Geneviève de Brabant, with her Child and a Deer;' 'Francesca de Rimini,' a leading attraction at the Exhibition of the National Academy, Brussels, in 1836; 'Melancholy;' 'La Fille du Pêcheur;' 'Prayer;' 'The Infant St. John;' 'Sleeping Children,' a very pleasing group, now in the possession of her Majesty at Osborne; and his 'Lion in Love,' one of the most admired pieces of sculpture in the Great Exhibition of 1851, though not in the purest taste or highest style of art. In the same exhibition were also a 'Paul and Virginia' and a 'Cupid' by him. Besides the monuments and monumental statues mentioned above, M. Geefs has executed a noble statue of Rubens, which now stands in the Place Vert at Antwerp, where the great painter long resided; a statue of Grétry; one of Malibran, for her monument at Laeken, near Brussels; a colossal marble statue of King Leopold, for the vestibule of the Palais National; and the grand monumental statue of Charlemagne, for the church of St. Serrais at Maastricht. He has also executed a series of eight very striking bas-reliefs, representing leading events in the life of St. Hubert, for the shrine of the saint, presented to the old church of St. Hubert at Ardennes by the King of the Belgians. Guillaume Geefs was the first Belgian sculptor to break away from the shackles imposed by a rigid adherence to Greek models. Working in the spirit rather than imitating the forms of the great Greek sculptors, Geefs preserved originality of conception; and, while exhibiting national character, he united largeness of style with much grace and poetic feeling. Several casts from the works of Geefs are in the Crystal Palace at Sydenham.

His wife, FANNY GEEFS, formerly Corr, is a clever painter of genre and portraits.

* JOSEPH GEEFS, younger brother of Guillaume, is likewise a sculptor of considerable ability. His earliest work, 'Adonis partant pour la Chasse,' was exhibited at Brussels Academy in 1833. He excels in female figures, and he has executed several very clever bassi-relievi and medallions.

GEIJER, ERIK GUSTAF, said by a Swedish critic to be equally eminent as a poet, a thinker, and an historian, was born at the iron-foundry of Ransäter, in Ransäter chapelry, province of Wermeland, Sweden, on the 12th of January 1783. His father, the proprietor of the foundry, was the descendant of a family which had emigrated to Sweden from Austria in the time of Gustavus Adolphus, and by establishing foundries had peopled the district. Geijer, in his 'Minnen,' or 'Reminiscences,' has given a vivid description of the wild country of his birth and the hearty patriarchal manners which prevailed in it, to both of which he was strongly attached. At twelve years old he was sent to the school of Carlstad, five Swedish miles south of his birthplace, and at sixteen to the University of Upsal; during his residence at which however, he enjoyed nothing so much as his frequent visits home, where he used to declare his conviction that the solemn academical disputations of Upsal would be the laughing-stock of future ages. At the age of twenty he was still without a degree, and when his friends, who were anxious to see some fruits of his studies, applied to a family of consideration to secure him the place of tutor, they received for answer that inquiries had been made at the university as to his character, and that he was found to be a "youth without steadiness." The rejection, and the motive assigned for it, stung Geijer to the soul. He resolved to do something to raise his reputation from so low a point, and without informing any one of his design, went to the parsonage, begged to look over a file of old newspapers, and ascertained that the subject of the great prize offered that year by the Swedish Academy was the 'Äreminnet,' or eulogy of Sten Sture, the administrator of the kingdom before the time of Gustavus Vasa. There was an imperfect copy of Dalin's 'History of Sweden' at the foundry-house; this he studied in secret, found means to possess himself of some paper, which was scarce in those quarters, and as fast as he wrote his essay, concealed the sheets in the unsuspected hiding-place of an old clock-case. It needed some contrivance to get the essay sent off by post without taking any one into his confidence, but this too was done. Some months after his sister asked him what made him turn so red on a sudden as he was reading the newspaper. He had come on an advertisement requesting the author of the essay on Sture, with a certain motto—the same which he had selected—to make himself known to the academy. He had won the prize, and from that day was looked on in a different light by his family and all his friends. In the next year, when he visited Stockholm, he was introduced to many of the leading literary men, and universally regarded as a youth of high promise. In the same year (1804), on a visit to his native Wermeland, he became acquainted, on a hunting excursion, with another young Wermelander, a student of the University of Lund, and they took a long ramble together, sleeping occasionally in barns, and keeping up a continual disputation. This student, who became a friend for life, was Esaias Tegnér, afterwards bishop of Wexjö, now universally regarded as the greatest poet whom Sweden has produced. "We never talked together, then or afterwards," Geijer said in later life in his eulogy on Tegnér, "without disputing; and as we never came to agree, perhaps the solution may be, that we never understood one another. How this might be with Tegnér I know not, but I at least believed that I understood him."

In 1806 Geijer took his degree, and soon after obtained a post in the National Archives; but he was anxious to travel in foreign countries, and in 1809 obtained his wish by visiting England as travelling tutor to a youth of the name of Von Schinkel. He staid about a twelvemonth in this country, two months of which were spent in studying English at Stoke Newington. Several of Geijer's letters from England were printed by himself in his 'Minnen' in 1834; others have appeared since his death in the collected edition of his writings now publishing. In one of them, dated from Bath in 1810, and first printed in 1855, he says, "I came to England with strong prejudices against the people. It is a nation, I thought to myself, in which a love for gain and a narrow selfishness has quenched all that is beautiful and noble. Mine was a Swedish notion of selfishness, drawn from an imperfect state of society, where the connection between the public and private advantage is often far from obvious. Here every man knows that connection; and there is no honest man in the world than the selfish industrious Englishman, from the merchant to the day-labourer. This result may be owing to prudence as well as to principle, but such is the case. No foreigner can come here without admiring the honour and the mutual confidence that prevail in commerce and in life." On his return to Sweden, Geijer was soon engaged in the editorship of a magazine having the name of 'Iduna,' set up by a society of twelve, of whom he was one, and his brother another, who christened themselves 'the Goths.' The main idea of their union was that of reviving the manners and spirit of their Gothic ancestors, and some of their rules and ceremonies were sufficiently childish; but for these the founder, one of their friends named Adlerbeth, was chiefly responsible. The 'Iduna' contained in its

earliest numbers poems by Geijer—'The Viking,' 'The Last Champion,' &c.—which were full of vigour and spirit, which became immediately popular, were translated into Danish and German, and still retain their place in all selections of Swedish poetry. In subsequent numbers the early cantos of 'Tegnér's Frithiof' appeared for the first time. As in the case of many other Swedish periodicals, there seems to have been no intention of continuing the 'Iduna,' however successful, for an indefinite space of time: it was brought to an end after ten numbers, and the society of the Goths, which was painfully kept up by the exertions of Adlerbeth for many years after the other members had grown tired of it, was finally buried in his grave on his death in 1844. Geijer put forth, in 1813, a translation of 'Macbeth;' and between 1814 and 1816 was associated with Afzelius in the publication of a collection of Swedish popular ballads, 'Svenska Folkvisor,' in 3 vols., to which however Geijer contributed little more than introductory matter. He had held from 1810, when he was elected during his absence in England, a subordinate post in the University of Upsal, and for some years was in search of a position that would enable him to marry. In 1816 he was appointed adjunct or assistant to Fant [FANT], the professor of history at the University of Upsal, on his retirement; he then married a lady to whom he had been engaged before his journey to England, and in the next year, on the death of Fant, he succeeded to the full professorship. His first lectures had an unexampled popularity, and the lecture-room was crowded, not only with students, but with the best society of Upsal, including ladies. These early lectures were different both in matter and manner from those which his more matured knowledge and taste afterwards approved: as he grew more profound he became less popular, but he still continued the pride of the university and the favourite of the students. His success with the eulogy of Sten Sture had proved his genius, but had not proved the steadiness he was charged with wanting, and as a professor he was not remarkable for regularity in the discharge of his duties. His musical tastes interfered a good deal with his other pursuits, and it was remarked that when he had once got to a pianoforte, it was not easy to get him away from it. He had also frequent leave of absence for the purpose of prosecuting historical researches. One of the most prominent incidents in his academical life was an academical trial to which he was subjected on account of his theological opinions. In an edition which he published about 1820, of the works of Thorild, a Swedish philosophical speculator, some passages in the introduction by Geijer, which was entitled, 'A Philosophical or Unphilosophical Confession of Faith,' were regarded by some of his colleagues as hostile to the doctrine of the Trinity, and the author was denounced to the university authorities, but a long examination terminated in an acquittal, which was celebrated as an important triumph of liberty of thought and liberty of the press in Sweden. Geijer says, in a passage in one of his writings, "I am not a Church-Christian; I am not a Bible-Christian, I am, so to speak, a Christian on my own account," and he concludes a statement of his way of thinking in theology with the declaration, "If this is Christianity, I am a Christian." The trial to which he had been subjected did not prevent his being twice offered a bishopric, that on the second occasion being in his native diocese of Carlstad, a distinction the more flattering that in Sweden a bishop must in the first instance be nominated by the clergy. He declined on both occasions. "Perhaps if I accepted," he wrote to a friend, "they might have a blameless middling bishop, but there would be an end of Erik Gustaf Geijer. It is not pride that speaks, but humility and conscience. I am afraid of this dignity, this new path, these new duties. Better keep on working in the circle where I am at home, and know that I work to some purpose. For the University of Upsal I am somebody. That would lose more than Wermeland gained." Geijer was in fact for many years in a distinguished position as the head of Swedish historical literature. He planned a great history of the country to supersede that of Dalin and Lagerbring, who have been for Sweden what Hume and Smollett have been for England; and it was universally acknowledged that his introduction to the great work, the first volume of 'Svea Rikes Häfder,' or 'Records of Sweden,' promised a masterpiece. Unfortunately the great work was never carried further. Before proceeding with it the author undertook another history of Sweden on a smaller scale, the 'Svenska Folkets Historia,' for the general collection of the histories of Europe, set on foot by Leo and Uckert; and this was carried before 1843, in three volumes, to the death of Queen Christina, but there it stopped. The professor, in place of continuing it, was occupied in examining the papers of Gustavus III., which the king had bequeathed to the University of Upsal, in a chest not to be opened till fifty years after his death. The work founded on these, 'Konung Gustaf III.'s efterlemnade Papper Öfversikt, Utdrag och Jämförelse af E. G. Geijer' (2 vols., 8vo, Upsal, 1848), disappointed the public expectation, but more owing to the insignificance of the royal legacy than to any deficiency on the part of the editor.

Geijer was also occupied with speculations in politics and political economy. Twice he was the representative of the University of Upsal at the diet, and while on the first occasion he was a warm defender of monarchical power, in the second (in 1838) he saw cause to modify his views, and lost the approbation of several of his former supporters by a change of opinion in favour of progress and liberalism, which he

avowed and defended in a periodical called 'Litteraturbladet,' written by himself. His views of pauperism were developed in 'The Poor Laws and their Bearing on Society, a Series of Political and Historical Essays,' which were published in English (Stockholm, 1840) as well as Swedish, and of which the English version, as it bears no translator's name, and has marks of a foreign hand, may possibly be from his own pen. A dissertation on the history of Sweden during the 'Frihetstiden,' or 'Freedom-Time,' as it is called, which extended from the death of Charles XII. to the revolution in favour of regal power which was forcibly effected by Gustavus III., is the last of Geijer's works of much importance. His opinions of the superiority of regal to aristocratical government did not pass unquestioned, and were the subject of a controversy with Fryxell [FRYXELL]. During about thirty years Geijer continued one of the literary magnates of Sweden, in constant intercourse with all that was distinguished. He was the intimate friend of Tegnér and Atterbom, had a correspondence with Frederika Bremer, and wrote both verses and music for Jenny Lind. In 1846 his health began to break, he was obliged to pay a visit to the Schlangenbad of Nassau, and resigned his professorship. He died at Stockholm on the 23rd of April 1847—a year which was fatal to many of the literary celebrities of Sweden.

A collected edition of Geijer's works was commenced soon after his death, but is still incomplete, though advanced (in 1856) to thirteen octavo volumes. A life by his son, Knut Geijer, is prefixed to the first volume, but before the second sheet had been printed the writer suddenly died. Most of the works of Geijer have been already mentioned. The most important is undoubtedly his 'Svenska Folkets Historia,' of which an English translation by J. H. Turner was published at London, and the first volume of a continuation of which by Carlson was issued in German, in Leo and Uckert's collection in 1855. Many of the volumes of his works are occupied with shorter pieces, articles in periodicals and papers read before the Swedish Academy, of which Geijer became 'One of the Eighteen' in 1824, and was afterwards for some years President. The academical dissertations of which he was the author are as yet not reprinted, but several of them—one in particular on the Swedish colonies in America—are of considerable interest. His letters and his minutes of conversations with Bernadotte, with whom he seems to have been a favourite, were first printed in this collection, and embrace much that is worthy of notice and preservation, especially when taken in conjunction with his 'Minnen,' or 'Reminiscences,' perhaps his most attractive production, but one which like so many others was left unfinished. It should be observed that Geijer had not only a taste but a talent for music, and enjoyed some reputation as a musical composer, a volume of music having been published in conjunction by himself and Lindblad.

GELASIUS I. succeeded Felix II. as Bishop of Rome in 492, and carried on the controversy with the Greek Church which had begun under his predecessor, but without bringing it to any conclusion. He died in 498, and was succeeded by Anastasius II. Gelasius wrote several theological works, such as 'De Duabus Naturis in Christo,' in which he expresses sentiments which are considered as opposed to transubstantiation. It is found in the Lyon 'Bibliotheca Maxima Patrum.'

GELASIUS II., a Benedictine monk, succeeded Paschal II. in 1118. The popes were then at open war with the emperors of Germany, and the partisans of the latter at Rome, headed by the powerful family of Frangipani, opposed the election of Gelasius, and afterwards seized him and personally ill-treated him, until he was rescued from their hands by the prefect of Rome. Soon after, the Emperor Henry V. came himself with troops, and the pope having run away to Gaëta, an anti-pope was elected by the imperial party, who styled himself Gregory VIII. Gelasius after many wanderings repaired to France, where he held a council at Rheims. He died at the convent of Cluny in January 1119, after a short but stormy pontificate, and was succeeded by Calixtus II.

GELL, SIR WILLIAM, was born in 1777, and was a younger son of Philip Gell, Esq., of Hopton, Derbyshire. He was educated at Jesus College, Cambridge, and took his degree of B.A. in 1798 and of M.A. in 1804. He was for some time a Fellow of Emanuel College. He is stated to have received his knighthood on the 14th of May 1803, on his return from a mission to the Ionian Islands; but of the nature of this mission we are not informed, and he certainly was not knighted at so early a date. He had already spent much of his time abroad, when on the Princess of Wales leaving England in 1814, she appointed him one of her chamberlains. He attended the princess in various parts of Italy, especially at Naples and Rome, as appears from the evidence he gave at the bar of the House of Lords in the course of the proceedings taken against her after she became queen and had returned to England in 1820. After this Gell returned to Italy, and he resided mostly at Naples till his death, which took place there on the 4th of February 1836. He had also however a house at Rome, in which he occasionally resided. He had long suffered severely from gout and rheumatism, and for some years before his death he had nearly altogether lost the use of his limbs.

Gell first appeared as an author in 1804, when he published his work entitled 'The Topography of Troy and its Vicinity, illustrated and explained by Drawings and Descriptions,' folio. This was followed by

'The Geography and Antiquities of Ithaca,' 4to, 1808; 'The Itinerary of Greece, with a Commentary on Pausanias and Strabo, and an Account of the Monuments of Antiquity at present existing in that Country,' 4to, 1810; 'The Itinerary of the Morea, being a Particular Description of that Peninsula, with a Map of the Routes,' 8vo, 1817; 'Pompeiana, or Observations upon the Topography, Edifices, and Ornaments of Pompeii' (in conjunction with J. P. Gandy, Esq.), 2 vols. 8vo, 1817-19; 'Attica,' folio, 1817; 'Narrative of a Journey in the Morea,' 8vo, 1823 (the journey having been performed in 1804); 'The Topography of Rome and its Vicinity,' 2 vols. 8vo, 1834 (an important work in reference to the cities anciently existing in the Campagna di Roma); 'Rome and its Environs' (a map), 1834. Gell was a good draftsman, and he has the merit of having carefully examined and delineated many monuments of antiquity. Some of his works are hurried performances, but they have all a certain value as being the results of actual observation. The one that brought the author most into notice was his 'Pompeiana'; of this a continuation, or second series, in 2 vols. 8vo, was published in 1835.

(*Gentleman's Magazine*, June, 1836; Gell, *Works*.)

GELLERT, CHRISTIAN FURCHTEGOTT, born near Chemnitz in Saxony, July 4, 1715, acquired a great reputation as a writer of fables and as a moralist. The simplicity of his manners, his candour and goodness of heart, contributed to render him popular with all classes. Frederick II. and Prince Henry were very partial to him, notwithstanding his habitual shyness. His 'Fabeln und Erzählungen' had a prodigious success in Germany. He also wrote 'Sacred Odes and Songs,' which are much esteemed. His 'Letters' have also been published. The collection of his works, 'Sämmtliche Werke,' forms part of the 'Karlsruher Deutscher Classiker,' 1823-26. His fables and letters were translated into French, 5 vols. 8vo, with a biographical notice of the author. Gellert died at Leipzig, where he was professor of philosophy, December 5, 1769, and a monument was raised to him in the church of St. John, with a cast of his head in bronze.

GELLIUS, AULUS (or, according to some writers, AGELLIUS), the author of the 'Noctes Atticæ,' was born at Rome in the early part of the 2nd century, and died at the beginning of the reign of the Emperor Marcus Aurelius. We have few particulars of his life: we know that he studied rhetoric under Cornelius Fronto at Rome, and philosophy under Phavorinus at Athens, and that he was appointed at an early age to a judicial office. ('Noct. Att.,' xiv. 2.) The 'Noctes Atticæ' was written, as he informs us in the preface to the work, during the winter evenings in Attica, to amuse his children in their hours of relaxation. It appears from his own account that he had been accustomed to keep a commonplace book, in which he entered whatever he heard in conversation, or met with in his private reading, that appeared worthy of memory. In composing his 'Noctes Atticæ,' he seems merely to have copied the contents of his commonplace book with a little alteration in the language, but without any attempt at classification or arrangement. This work contains anecdotes and arguments, scraps of history and pieces of poetry, and dissertations on various points in philosophy, geometry, and grammar. Amidst much that is trifling and puerile, we obtain information on many subjects relating to antiquity of which we must otherwise have been ignorant. It is divided into twenty books, which are still extant, with the exception of the eighth and the beginning of the seventh. He mentions in the conclusion of his preface his intention of continuing the work, which he probably never carried into effect. The 'Noctes Atticæ' was printed for the first time at Rome in 1469, and has been frequently reprinted; the most valuable editions are the Bipont, 2 vols. 8vo, 1784; one by Gronovius, 4to, 1706 (reprinted by Conradi, Leipzig, 1762); and one by Lion, 2 vols. 8vo, Göttingen, 1824. The work has been translated into English by Beloe, 3 vols. 8vo, London, 1795; and into French by Douzé de Verteuil, 3 vols. 12mo, Paris, 1776-77.

GELON, a native of Gela, rose from the station of a private citizen to be supreme ruler of Gela and Syracuse. He was descended from an ancient family, which originally came from Telus, an island off the coast of Caria, and settled at Gela when it was first colonised by the Rhodians; at which place his ancestors held the office of hereditary minister of the infernal gods (*χθονια θεοι*, Herodotus, vii. 153). During the time that Hippocrates reigned at Gela (B.C. 498-91), Gelon was appointed commander of the cavalry, and greatly distinguished himself in the various wars that Hippocrates carried on against the Grecian cities in Sicily. On the death of Hippocrates, who fell in a battle against the Siceli, Gelon seized the supreme power (B.C. 491). Soon afterwards a more splendid prize fell in his way. The nobles and landholders (*γαμύροι*) of Syracuse, who had been expelled from the city by an insurrection of their slaves supported by the rest of the people, applied to Gelon for assistance. This crafty prince gladly availing himself of the opportunity of extending his dominions, marched to Syracuse, into which he was admitted by the popular party (B.C. 485), who had not the means of resisting so formidable an opponent. (Herodotus, vii. 154, 155.) Having thus become master of Syracuse, he appointed his brother Hieron governor of Gela, and exerted all his endeavours to promote the prosperity of his new acquisition. In order to increase the population of Syracuse, he destroyed Camarina, and removed all its inhabitants, together with a great number of the citizens of Gela, to his favourite city. As he was indebted for his

power in Syracuse to the aristocratical party, he took care to strengthen it against the people. Thus when he conquered the Megarians and Eubeans of Sicily, he transplanted to Syracuse all those who were possessed of wealth, but sold the remainder as slaves. (Herod. vii. 156.) By his various conquests and his great abilities he had become a very powerful monarch; and therefore when the Greeks expected the invasion of Xerxes, ambassadors were sent to Syracuse to secure if possible his assistance in the war. Gelon promised to send to their aid 200 triremes, 20,000 heavy-armed troops, 2000 cavalry, and 6000 light-armed troops, provided the supreme command were given to him. This offer being indignantly rejected by the Lacedæmonian and Athenian ambassadors, Gelon sent, according to Herodotus, an individual named Cadmus to Delphi with great treasures, with orders to present them to Xerxes if he proved victorious in the coming war. (Herod. vii. 157-64.) This statement however was denied by the Syracusans, who said that Gelon would have assisted the Greeks if he had not been prevented by an invasion of the Carthaginians with a force amounting to 300,000 men under the command of Hamilcar. This great army was entirely defeated near Himera by Gelon, and Theron, monarch of Agrigentum, on the same day on which the battle of Salamis was fought. (Herod. vii. 165-67.) An account of this expedition is also given by Diodorus (b. xi. p. 254, Steph.), who states that the battle between Gelon and the Carthaginians was fought on the same day as that of Thermopylæ.

Coin of Gelon.

British Museum. Actual size. Silver. Weight 98 grains.

Gelon appears to have used with moderation the power which he had acquired by violence, and to have endeared himself to the Syracusans by the equity of his government and the encouragement he gave to commerce and the fine arts. There are still existing many coins of Gelon and his successor Hieron, of beautiful workmanship, of which a description is given in Mionnet, vol. i. p. 328. It is supposed by some that these coins were not struck in the time of Gelon, but by order of Hieron II. (B.C. 275-216), a supposition somewhat inconsistent with the number of coins still remaining; though it is probable that some at least of them may belong to Gelon II., the son of Hieron. We are informed by Plutarch, that posterity remembered with gratitude the virtues and abilities of Gelon, and that the Syracusans would not allow his statue to be destroyed, together with those of the other tyrants, when Timoleon was master of the city. ('Life of Timoleon,' p. 247.) He died B.C. 478, and was succeeded by his brother Hieron. (Aristotle, 'Polit,' b. v., c. 12, p. 678, Elzevir.)

GEMINIANI, FRANCESCO, a distinguished composer and violinist, was born at Lucca about 1680. The foundation of his professional knowledge was laid by Alessandro Scarlatti, but he completed his studies under Corelli. England was then, as now, the place of attraction for foreign musical talent, and Geminiani arrived in London in 1714, where his performance speedily gave him celebrity. He soon became acquainted with Baron Kilmanssegge, chamberlain to George I. as Elector of Hanover, through whose means he was introduced to the king, and had the honour to perform before that sovereign some of his recently published Sonatas, for 'Violino, Violone, e Cembalo,' in which Handel accompanied him on the harpsichord. Successful as he was professionally, his finances were continually in a disordered state, and to relieve his embarrassed circumstances he applied for the appointment of Composer of State Music in Ireland, and through the interest of the Earl of Essex was nominated to that good situation; but finding a difficulty in taking the necessary oaths, the office was given to his pupil, Matthew Dubourg. He now set down industriously to compose, and published numerous works. Six of Corelli's solos and as many of that great musician's sonatas he converted into concertos for a band, and in so efficient a manner, that some of them have retained their vitality almost to the present day. These were followed by his own six orchestral concertos, 'Opera Terza,' and twelve sonatas for violin and base, all of which abound in beautiful melody, and evince his skill in harmony. His deep knowledge of harmony was further exhibited soon after, in his 'Guida Armonica,' a work which met with strong opposition among musicians of the old school, but was finally triumphant. But as the emoluments arising from his many publications were by no means commensurate to the thought and time necessarily bestowed on them, or to his expensive habits, his necessities still pursued him, and he had recourse to a kind of benefit-concert at Drury-Lane Theatre, by which he made a considerable sum. He then went to Paris, and there printed two sets of concertos. On his return to England he continued composing and publishing. In 1761 he paid a visit to his friend Dubourg in Dublin; but soon after his arrival in that city he lost, through the treachery of a servant, a

manuscript treatise on music, on which he had bestowed much time and labour, and on the success of which his hopes of future independence were founded. This he never recovered; and the circumstance so preyed on his mind, that we are told it shortened his life, though probably not by any long period, for he reached his eighty-third year. He died in Dublin in 1762.

GENDRE LE. [LEGENDE.]

GENGIS KHAN was the son of a Mogul chief named Pisoucau or Yesoucau, who ruled over 30,000 or 40,000 families. He was born A.H. 559 (A.D. 1164), at a place called Blun Yulduck. His original name was Temugin, which he exchanged for that of Gengis Khan, that is, 'Khan of Khans,' when he became the supreme ruler of the Moguls and Tartars.

Gengis Khan was early trained to the art of war. His father died when he was in his fourteenth year; and the neighbouring princes took advantage of his youth to invade his dominions. At this early age he marched in person against his enemies, but was obliged to retreat, and fled for protection to Oung, the powerful Khan of the Keraites. [PRESTER JOHN.] Gengis Khan remained for many years in the court of Oung Khan, who gave him his daughter in marriage, and advanced him to the highest dignities in his kingdom. Gengis Khan at length incurred the suspicions of his patron, and orders were given for his arrest. He escaped this danger, and returned to his own dominions, where he defeated the troops that were sent against him, and persuaded many of the Mogul hordes that were subject to Oung Khan, to rebel against his authority. Oung Khan marched in person against them, but was entirely defeated by Gengis Khan, A.H. 599 (A.D. 1202), who obtained the dominions of his father-in-law in consequence of this victory. He next conquered the Naimans, and compelled the most celebrated of the Mogul and Tartar chiefs to submit to his authority. Having thus united the various hordes that wander over the steppes of Central Asia, he summoned a great council consisting of Mogul and Tartar chiefs, in which he was proclaimed *Khan* of the whole nation, A.H. 602 (A.D. 1205). In the same assembly he disclosed his intention of invading China and Southern Asia, and pretended to have received from heaven a commission for the conquest of the world. With this object in view, he published a code of laws, and introduced stricter discipline into the army, which he divided into bodies of tens, hundreds, thousands, and tens of thousands; called respectively in the Mogul language *Deke*, *Sede*, *Hizare*, and *Toman*. Before he could carry his projects into effect, he was obliged to defend himself against those Mogul chiefs who refused to submit to his sovereignty. These chiefs were subdued in the course of five years; and Gengis Khan was at length able to commence his career of conquest. China first experienced the devastations of the Moguls, A.H. 607 (A.D. 1210); but a temporary peace was concluded between the two countries, and the daughter of the king of China was married to Gengis Khan. Three years afterwards another Mogul army invaded the country, and after defeating the Chinese, took the city of Peking. The northern provinces of China were from this period annexed to the Mogul empire.

The most powerful monarch in Southern Asia at this time was Mohammed Kothbeddin, king of Carizme, whose ancestors had established an independent monarchy on the decline of the power of the Seljuke Sultans. He ruled over almost all the countries of Southern Asia from Syria to the Indus, and had demanded of the Abbasside Kalif to be allowed to reside at Baghdad as *Emir al Omara*, a dignity which had formerly belonged to the Seljuke Sultans. This demand was refused; and the kalif fearing the power of Mohammed, sent an ambassador to Gengis Khan to implore his assistance. Gengis Khan did not immediately comply with the kalif's request; but anxiously waited for some act of hostility on the part of Mohammed to justify him in breaking the peace which then subsisted between them. This was soon given him by the murder of some Mogul ambassadors and merchants at Otrar, a town on the Jaxartes, in the dominions of Mohammed. Gengis Khan collected all his forces, and with an army of 700,000 men, according to Oriental historians, advanced to the Jaxartes, A.H. 615 (A.D. 1218). Near this river he was met by Mohammed with an army of 400,000 men, and though the issue of the battle was doubtful, Mohammed dared not hazard a second contest, but retreated to the south after placing strong garrisons in all the fortified towns. The conquest of Transoxiana was completed in two years, and all its cities taken, after an obstinate resistance. A body of 30,000 men was sent into Khorasan to pursue Mohammed, who escaped to an island in the Caspian Sea, where he died shortly afterwards.

In A.H. 618 (A.D. 1221) Gengis Khan advanced eastward and entered the city of Balkh, whose inhabitants he massacred on account of the assistance they had rendered to Gelal-Eddin, the son of Mohammed. While he was engaged in the conquest of the neighbouring countries, he sent part of his forces to subdue Khorasan, part to conquer the western provinces of Persia, and an army of 80,000 men to pursue Gelal-Eddin, who had fled into the countries west of the Indus. These expeditions were successful, with the exception of the last. Gelal-Eddin, who appears to have been a brave and enterprising prince, defeated the Moguls, but was soon afterwards conquered by Gengis Khan, who had marched in person against him. In the two following years the lieutenants of Gengis Khan conquered Azerbaijan and all

the other provinces of the Persian empire. In A.H. 620 (A.D. 1224), he again crossed the Jaxartes, and returned to his capital, Cara-Corum, after an absence of seven years, during which period he had laid waste the most fertile regions of Asia, plundered the cities of Carizme, Herat, Balkh, Candahar, Bokhara, Samarcand, and many others of less note, and destroyed, according to the calculation of Oriental historians, five millions of human beings. His empire now extended from the Volga to the Pacific, and from Siberia to the Persian Gulf; but he still meditated new conquests, and in the following year led his victorious Moguls through the desert of Gobi against the King of Tangut, whom he defeated and subdued. He then continued his march towards the southern provinces of China, but died on the borders of that country on the 10th of Ramadhan, A.H. 624 (24th of August 1227), in the sixty-fourth year of his age. He was succeeded by his son Oetai. His two other sons had the provinces of Transoxiana and Khorasan assigned to them. The Mogul princes have always claimed descent from the family of Gengis Khan; but his descendants lost all real power, though they still retained the title of khan, in the time of Tamerlane. [TIMUR.]

The code of laws published by Gengis Khan is still known in Asia under the title of '*Isa Gengis Khani*' ('The Laws of Gengis Khan'). An interesting account of them is given by M. Langlès in the fifth volume of '*Notices et Extraits des Manuscrits de la Bibliothèque du Roi*.'

GENLIS, STEPHANIE-FELICITÉ-DUCREST DE ST. AUBIN, COUNTESS DE, was born near Autun, in 1746, of a respectable but not rich family. She became at an early age a proficient in music, and her skill as a player introduced her to some persons of distinction, in whose company she had an opportunity of studying the manners and adopting the language of refined society. Her first writings exhibited an elegance and fluency of diction, which attracted attention, and excited the interest of the Count de Genlis, who married her. She was soon after entrusted with the education of the children of the Duke of Orleans, and one of her pupils, Louis Philippe, was afterwards king of the French. In the course of her task, to which she brought great assiduity and zeal, she wrote several works for the use of her pupils, which were afterwards published, namely, '*Les Veillées du Château*,' '*Les Annales de la Vertu*,' '*Le Théâtre de l'Education*,' '*Adèle et Theodore*,' &c. These rank among her most useful works, and they have had and perhaps still have an extensive popularity. After the French revolution broke out, Madame de Genlis, who had been at first its partisan, was obliged to seek safety in flight; she went successively to England, Belgium, Switzerland, and lastly to Hamburg, followed everywhere by the suspicions which her avowed sentiments, her connections with several leading revolutionists (among others with Lord Edward Fitzgerald, who married her adopted daughter, Pamela), and the slander of the royalist emigrants, raised against her. At Hamburg she wrote a kind of political work styled '*Les Chevaliers du Cygne*,' which did not add to her reputation either as an author or a moralist. She afterwards attempted a justification of her own conduct and sentiments—'*Précis de la Conduite de Madame de Genlis*.' She returned to France under the consulship of Bonaparte, who had a favourable opinion of her talents, and she became one of his admirers and panegyrists. After her return to Paris she wrote '*De l'Influence des Femmes sur la Littérature*,' in which she replied to the attacks of some of the principal literary men of Paris, and Ginguéné among the rest; and she also assailed some authors of her own sex, among others, Madame Cottin.

The pen of Madame de Genlis seemed inexhaustible. After the restoration she wrote in defence of monarchy and of religion; her work, '*Les Diners du Baron d'Holbach*,' which is in a great measure historical, and in which she exposes the weaknesses and the intrigues of the so-called philosophers of the 18th century, made a great sensation, and roused the anger of the freethinking party in France. It is a work that contains some curious information. She also wrote '*Dictionnaire Critique et Raisonné des Etiquettes de la Cour*,' 2 vols. 8vo, 1818. When she was past eighty years of age she wrote her memoirs. She lived to see the events of July 1830, and her former pupil raised to the throne. She died on the 31st of December 1830, aged eighty-four.

Besides the works mentioned above, Madame de Genlis wrote numerous novels, of which those styled '*La Duchesse de la Vallière*,' '*Les Battuecas et Zuma*,' '*ou la Découverte du Quinquina*,' are the best. Her works have been published together in 84 vols. 12mo.

GENOVESI, ANTONIO, born near Salerno in 1712, was ordained priest in 1736, and was made professor of eloquence in the clerical seminary of Salerno. He afterwards repaired to Naples, where he was allowed, through the influence of Monsignor Galliani, archbishop of Taranto, to open a class of metaphysics in that university in 1741. He there wrote his '*Elements of Metaphysics*,' in Latin, which he afterwards recast into two Italian works, '*Logica per i giovanetti*,' and '*Delle Scienze Metafisiche*,' which had great success, and are still much esteemed. His '*Logica*' is perhaps the best elementary book of that science in the Italian language. His '*Meditazioni filosofiche sulla Religione e sulla Morale*,' are replete with sound judgment, though written in a defective style. In his '*Diceosina, o la Filosofia dell' Onesto e del Giusto*,' he proceeds on the principle that "every thesis in morality is susceptible of logical demonstration."

These are the principal works of Genovesi on the moral sciences. We must now consider him as a political economist. In 1754, Bartolomeo Intieri, a wealthy Florentine merchant settled at Naples, founded a chair 'of commerce and mechanics,' and, with the approbation of the king, appointed Genovesi to fill it. This was the first chair of political economy, taken as a distinct science, established in Europe. In the course of his professorship Genovesi wrote his 'Lezioni di Commercio, o di Economia civile,' 2 vols. 8vo. His book is full of sound principles, which were quite new at Naples in his time, although in some instances he still adhered to the Colbert school. His lectures excited a prodigious sensation among the Neapolitans; public attention was at once turned to questions of commerce, arts, and agriculture; and political economy, the very name of which was hitherto unknown, became quite a fashionable study.

When in 1767 the Jesuits were exiled from the kingdom, the minister Tanucci consulted Genovesi as to a new plan for the organisation of the schools and colleges of the kingdom, which he drew up accordingly. He continued to lecture and to write, although his health was greatly impaired for several years, almost to the day of his death, which occurred in September 1769. A selection of Genovesi's familiar letters was published after his death, in two small volumes. He edited in his lifetime the 'Course of Agriculture' of Cosimo Trinci, to which he added notes and a preliminary discourse on the state of Neapolitan agriculture in his time. Galanti, one of Genovesi's best disciples, wrote an 'Elogio Storico,' or biographical notice of his master, and Fabroni wrote another in Latin. Ugoni, in his 'Letteratura Italiana,' devotes a long article to Genovesi.

GENSERIC, King of the Vandals, was the bastard brother of Gonderic, whom he succeeded A.D. 429. In the same year he left Spain, which had been partly conquered by the Vandals, and crossed over into Africa at the solicitation of Boniface, governor of that province, who had been induced, by the arts of his rival Ætius, to rebel against Valentinian III., emperor of the West. Boniface soon repented of the step he had taken, and advanced to meet the invader. But his repentance came too late. The Moors joined the standard of Genseric, and the powerful sect of the Donatists, who had been cruelly persecuted by the Catholics, assisted him against their oppressors. Boniface was defeated, and obliged to retire into Hippo Regius, where he remained till he obtained a fresh supply of troops. Having ventured upon a second battle, and being again defeated, he abandoned the province to the barbarians, and sailed away to Italy. A peace was concluded between Genseric and the emperor of the West, by which all Africa, to the west of Carthage, was ceded to the Vandals. This however did not long continue; and the city of Carthage was taken by the Vandals by surprise in 439. The emperors of the West and East made great preparations for the recovery of the province; but an alliance which Genseric formed with Attila, king of the Huns, effectually secured him against their attempts.

Genseric's next object was directed to the formation of a naval power; an immense number of ships was built, and his fleets ravaged the shores of Sicily and Italy. Invited by the empress Eudoxia, he sailed up the Tiber (455), and permitted his soldiers, for the space of fourteen days, to pillage Rome. In 460 he destroyed the fleet which the emperor Majorian had collected for the invasion of Africa; and as his power increased his ravages became more extensive; the island of Sardinia was conquered, and Spain, Italy, Sicily, Greece, Egypt, and Asia Minor, were plundered every year by the Vandal pirates. Leon, the emperor of Constantinople, at last resolved to make a vigorous effort for the recovery of Africa. A great army was assembled, and the command was given to Basiliscus. He landed at Bona, and at first met with considerable success, but was at length obliged to retire from the province. After this victory Genseric met with no further opposition, but remained undisturbed master of the sea till his death, which happened in 477. He was succeeded by his son Hunneric. Genseric was an Arian, and is said to have persecuted the Catholics with great cruelty.

(Procopius, *De Bell. Vandal*; Gibbon, *Decline and Fall*, c. xxxiii. —xxxvi.)

GENSONNÉ, ARMAND, a member of the National Convention, and one of the leaders of the Girondist party, was born at Bordeaux, August 10, 1758, and was practising as a lawyer in his native town when the revolution broke out. Although more endowed with decision and firmness of character than with eloquence, he was chosen deputy to the legislative assembly in September 1791, and was one of the first to attach himself to the new party of the Gironde, which included Gaudet, Vergniaud, Isnard, and Brissot among its leaders. He had better habits of business than any of these distinguished men, and was consequently more frequently employed than they were on the parliamentary committees, in which he obtained much influence. He was the first to enunciate the atrocious maxim, "That in times of revolution, suspicion alone is sufficient to warrant a conviction." It was likewise Gensonné who carried the measure which sequestered the property of the emigrants; and in conjunction with his colleague Brissot he induced the chamber to declare war against Austria, in spite of the strenuous efforts of Robespierre to prevent them. In September 1792 he was elected a member of the Convention, and proposed that the king's trial should be referred to the *Assemblée des Primaire*s. His views about this time appear to have changed con-

siderably. He advocated a more moderate course; denounced the system of domiciliary visits; and loudly called for the punishment of the September assassins. It was only in compliance with his party that he voted for the king's death. In the struggle which immediately followed for power between the Jacobin and Girondist parties the Jacobins were triumphant, and Gensonné having been arrested on the 2nd of June 1793, with twenty-one of his colleagues, was guillotined on the 31st of October in the same year.

GEOFFREY OF MONMOUTH, otherwise named ARTHUR, the well-known British historian, was born in the town from which he took his name, and is supposed to have received his education at the Benedictine monastery in its vicinity. Tradition still points out a small apartment in the remains of that monastery which is designated as his study. He was made archdeacon of Monmouth, and on the 24th of February 1152 consecrated bishop of St. Asaph. Robert, earl of Gloucester, natural son of Henry I., and Alexander, bishop of Lincoln, were his chief patrons.

Walter Mapes, at that time archdeacon of Oxford, a diligent inquirer for his day after the works of ancient authors, is said, whilst journeying in Armorica, to have met with a history of Britain written in the British tongue, the translation of which, upon his return to England, he recommended to Geoffrey of Monmouth, who undertook the task and completed it with great fidelity. At first he divided it into four, but afterwards into eight books, to which he added the book of Merlin's 'Prophecies,' which he had also translated from British verse into Latin prose. Numerous fabulous and trifling stories are inserted in the history, to an extent which has induced some authors, and among them Buchanan, to consider the whole as fiction; but others, among whom are Archbishop Usher, Leland, &c., consider that parts of his history are true, and that the work is not to be rejected in the gross. Welsh critics assert that Geoffrey's work was a vitiated translation of the 'History of the British Kings,' written by Tyssilio or St. Talian, bishop of St. Asaph, who lived in the 7th century, and translated by the Rev. P. Roberts in 1811; but it is by no means certain that the Welsh History, of which the manuscripts are stated to be all comparatively modern, was not itself translated or compiled from Geoffrey's work. The best modern writers incline to the opinion that the book is in the main a fabrication, and the pretended history, from which Geoffrey states that he translated his work, a myth; the book being really a kind of romance, founded upon popular legends, to which he gave cohesion by borrowing largely from Gilders and other early writers.

Several editions of Geoffrey's history are extant in Latin: the earliest is in 4to, printed by Ascensius at Paris in 1508; reprinted in 4to, 1517. It was also printed by Commeline at Heidelberg, in folio, 1587, among the 'Rerum Britannicarum Scriptores vetustiores et præcipui.' A translation of it into English, by Aaron Thompson, of Queen's College, Oxford, was published in London in 1718, in 8vo, and reprinted by Dr. Giles in 1842, and again in Bohn's 'Antiquarian Library,' 1848.

Copies of Geoffrey of Monmouth's history, in manuscript, are not unfrequent in our great libraries: several, of an age very near his time, are preserved among the manuscripts of the old Royal Library in the British Museum; one formerly belonging to the library of Margan Abbey is believed to be the best. Geoffrey of Monmouth died about the year 1154.

GEOFFROY, ST. HILAIRE. [ST. HILAIRE, GEOFFROY.]
GEORGE, ST., surnamed of CAPPADOCIA, was a native of Epiphaneia in Cilicia, and is said to have been born in a fuller's shop. From this obscure and servile origin he raised himself by the talents of a parasite, and the patrons whom he flattered procured for him a lucrative commission or contract to supply the army with bacon. He accumulated wealth in this employment by fraud, and his depredations on the public purse at last became so notorious, that he was compelled to fly from the pursuit of justice to Alexandria, where he embraced, with real or affected zeal, the profession of Arianism. Here he formed a valuable library of history, rhetoric, philosophy, and theology, which the emperor Julian, after St. George's death, appropriated to himself. So great had the influence of George of Cappadocia become amongst the disciples and followers of Arius, that when Athanasius was driven from Alexandria the prevailing faction elevated him to the vacant episcopal throne. Gibbon has enlarged upon the avarice and tyranny of his character whilst primate of Egypt. The Pagans, who had been flattered with the hopes of freedom and toleration, excited his avarice; and the rich temples of Alexandria were either pillaged or insulted by the haughty prelate, who exclaimed in a loud and threatening tone, "How long will these sepulchres be permitted to stand?" Under the reign of Constantine he was expelled by the people; and it was not without a violent struggle that the civil and military powers of the state could restore his authority. The messenger who proclaimed at Alexandria the accession of Julian, in 361, announced the downfall of the archbishop. George, with two of his ministers, Count Diodorus, and Dracontius, master of the mint, were dragged in chains to the public prison. At the end of twenty-four days the prison was forced open by the rage of a superstitious multitude, impatient of the tedious forms of judicial proceedings. The archbishop and his minister were murdered by the populace, and their lifeless bodies were carried in triumph through the streets on the

back of a camel. Their remains were thrown into the sea; the popular leaders of the tumult declaring their resolution to disappoint the devotion of the Christians, and to intercept the future honours of these martyrs, who had been punished, like their predecessors, by the enemies of their religion. The date of the canonisation of St. George is uncertain; but he was recognised as a saint by Pope Gelasius in 494. Some Roman Catholic and Anglican writers however deny, or doubt, the identity of the St. George of the calendar with George of Cappadocia.

The reader who would enter into the history of St. George of Cappadocia as the patron saint of England may consult 'The Historie of that most famous Saint and Souldier of Christ Jesus, St. George of Cappadocia, asserted from the fictions of the middle ages of the Church and opposition of the present,' by Dr. Peter Heylyn, 4to, Lond., 1631 and 1633; 'A Dissertation on the Original of the Equestrian Figure of the George and of the Garter, ensigns of the most noble order of that name,' by John Pettingall, 4to, Lond., 1753; and Dr. Pegge's 'Observations on the History of St. George, the Patron Saint of England,' in the 'Archæologia,' vol. v., p. 132.

When the English Crusaders went to the East in 1096, they found St. George received among the Christians as a warrior-saint, with the peculiar appellation of 'Tropæophoros (Τροπαιοφόρος) the victorious.' They had some knowledge of him before as a saint and martyr, having read of him in that capacity in their Calendars and Martyrologies; and, after the succour which he was supposed to have afforded them at the siege of Antioch, they adopted him as the patron of soldiers. As such, Edward III. made him patron of the Order of the Garter; and he thus gradually became considered as the patron of chivalry, and the tutelar saint of England.

GEORGE (LOUIS) I., King of Great Britain. After the exclusion of James II. and his son in 1689, the nearest heirs to the throne in the lineal order of succession were—1, The Princess Mary of Orange, eldest daughter of James II.; 2, the Princess Anne of Denmark, younger daughter of James II.; 3, William prince of Orange, son of Mary, eldest daughter of Charles I. By the declaration of both houses of the convention on the 12th of February 1689, it was resolved that after the decease of the prince and princess of Orange, the crown should descend, first, "to the heirs of the body of the said princess; and for default of such issue, to the Princess Anne of Denmark, and the heirs of her body; and for default of such issue, to the heirs of the body of the said Prince of Orange." This settlement was confirmed in the second session of the first parliament of William and Mary, by the statute 1 W. and M., s. 2, c. 2, commonly called the Bill of Rights. In the preceding session however, when the Bill of Rights was first brought forward, the king had instructed his ministers to propose a clause for a further limitation of the succession, failing heirs of his own body, to the Electress Sophia of Hanover. The electress of Hanover (or, as appears to be the more correct electoral style, of Brunswick and Lüneburg), being the youngest of the ten children of Elizabeth, queen of Bohemia, the daughter of James I., stood in the regular order of inheritance, not only after the descendants of Henrietta, the younger daughter of Charles I., from whom sprung the royal houses of Savoy, France, and Spain, but also after the descendants of her own elder brothers, Charles Louis, elector palatine, the ancestor of the houses of Orleans and Lorraine, and Edward, through whom the houses of Salm, Ursel, Bourbon, Conty, Maine, Modena, and the Imperial family were brought into the line of succession. All these families however were Roman Catholics; that of Hanover was the nearest Protestant family after the house of Orange. The proposition for the insertion of the name of the Princess Sophia in the bill respecting the settlement of the succession was made, according to the king's desire, in the House of Lords, and adopted there; but when the bill was sent down to the Commons, the clause was opposed both by the Tory and by the Republican parties, though on opposite principles, and was thrown out in spite of all the exertions of the court. The consequence was, that after the bill had been under discussion for about two months, it was for the present allowed to drop altogether, on the birth (24th of July) to the Princess Anne of a son, William, afterwards proposed to be created Duke of Gloucester (he died before the patent passed the great seal), by which it seemed to be rendered of less pressing importance. When it was brought in again in the following session, the proposition respecting the Princess Sophia was not renewed; but by a clause excluding Papists, the succession, as King William himself expressed it in writing to her on the subject, was "in a manner brought to her door." The death of Queen Mary however (January 1, 1695), and that of the Duke of Gloucester, the last of seventeen children that had been born to the Princess of Denmark (30th of July, 1700), made it extremely desirable that the matter of the succession should no longer remain unsettled. The subject accordingly was strongly recommended to the attention of parliament in the royal speech delivered February 10, 1701. The recommendation was coldly received by the majority of the House of Commons; but at length, by the contrivance, it is said, of the parties opposed to the scheme, the further limitation of the crown to the

Electress Sophia and her heirs was formally proposed by Sir John Bowles, "who," says Tindal, "was then disordered in his senses, and soon after quite lost them." It is affirmed that a proposition was now made by several influential members of the Upper House to the ambassador of the Duke of Savoy, that that prince should send one of his sons to be educated as a Protestant in England, in which case they gave their assurance that the plan of the Hanoverian succession should be defeated; but the duke would not consent. Meanwhile a bill, founded on the motion of Sir John Bowles, was introduced into the House of Commons; and although it remained in suspense for many weeks, it was eventually carried through both houses. This is the 12th and 13th Will. III., c. 2, which declares that the crown of England, France, and Ireland, "after his majesty and the Princess Anne of Denmark, and in default of issue of the said Princess Anne and of his majesty respectively," should descend "to the most excellent Princess Sophia, electress and duchess-dowager of Hanover, and the heirs of her body, being Protestants." The settlement thus made was further confirmed the next session by the 13th Will. III., c. 6, called the Abjuration Act, from the oath abjuring allegiance to the pretender therein enjoined to be taken and subscribed. The clause imposing this oath was carried in the House of Commons by only one vote; the Tories, by whom it was opposed, endeavouring to strengthen their cause by insinuations (which were most probably entirely without foundation) that the court now meditated the bringing in of the Hanover family even before the Princess Anne. Several attempts were made after this to prevail upon the parliament of Scotland to adopt the same settlement for the crown of that kingdom which had thus been established for the English crown; but they were all ineffectual, till the object was at last accomplished in 1706 by the Treaty of Union, the second article of which declared "that the succession to the monarchy of the United Kingdom of Great Britain, and of the dominions thereunto belonging, after her most sacred majesty, and in default of issue of her majesty, be, remain, and continue to the most excellent Princess Sophia, electress and duchess-dowager of Hanover, and the heirs of her body, being Protestants, upon whom the crown of England is settled" by the act already mentioned. Before this, by the 4th Anne, c. 1 and 4, the Princess Sophia, "and the issue of her body, and all persons lineally descending from her, born or hereafter to be born," were naturalised, so long as they should not become Papists. By the 4th Anne, c. 8, also, the next Protestant successor to the throne was empowered to name any additional number of persons to act with seven lords-justices appointed in the statute to administer the government between the death of the queen and the arrival of the said successor in the kingdom. Most of these arrangements were confirmed by various clauses in the 6th Anne, c. 7, entitled 'An Act for the Security of Her Majesty's Person and Government, and of the Succession to the Crown of Great Britain in the Protestant Line.' Finally, by the 10th Anne, c. 4, passed in 1711, precedence was given to the Princess Sophia, to "the most serene elector of Brunswick Lunenburg, her son and heir-apparent, the most noble George Augustus, electoral prince of Hanover and duke of Cambridge, only son of the said most serene elector, and also the heirs of the body of the said most excellent princess, being Protestants, before the Archbishop of Canterbury, and all great officers, and the dukes, and all other peers of these realms." The Hanoverian succession was guaranteed by the treaty concluded with the United Provinces of Holland in 1706, by the Barrier Treaty between Great Britain and Holland in 1709, and by the Treaty of Guarantee between the same powers in 1713; and the validity of the settlement was acknowledged by the Treaties of Peace concluded in the last-mentioned year, at Utrecht, between Great Britain and France, and between Great Britain and Spain. ('General Collection of Treaties,' vol. i. p. 434; vol. ii. p. 479; and vol. iii. pp. 364, 398, and 470.)

After the accession of Anne, no party affected so great a zeal for the Hanoverian succession as the extreme section of the Tories, or Jacobites, whose object, of course, was anything rather than really to support the parliamentary settlement. In 1705, Lord Rochester, one of the heads of this faction, first intimated obscurely in the House of Lords, and more openly among his friends, his intention of proposing that the Electress Sophia should be invited to come over to reside in England. The real object was to irritate the queen, who was known to be strongly averse to the presence of the electress, or indeed of any member of the electoral family in England, and to embarrass the Whigs, who if they assented to it would probably cut themselves off from all chance of favour with the court, of which they were at this time in expectation, while by resisting it they would endanger both their popularity with the nation and also perhaps the confidence of the Hanoverian family. The next session a motion that the heiress presumptive to the throne should be invited over was formally made in the House of Lords by Lord Haversham, but after a warm debate (at which the queen was present), it was rejected by a great majority. Some years after, in altered circumstances, nearly the same game was attempted to be played by the Whigs, at whose instigation, in April 1713, the Hanoverian resident, Baron Schütz, suddenly made application to the Lord Chancellor Harcourt for a writ of summons to the House of Lords to the Electoral Prince (afterwards George II.), who had been made a British Peer in 1706, by the title of Duke of Cambridge. This application, and a report which was at the same time

spread that the Duke of Cambridge would in any circumstances immediately come to England, threw the ministry into no small perplexity, and so greatly annoyed and irritated the queen that she forbade Baron Schutz to appear at court. The following year however another report was spread, that the Princess Sophia intended to solicit permission from her majesty for the Electoral Prince to come to England. On this the queen wrote both to the princess, to her son the elector, and to the Electoral Prince himself, expressing her disapprobation of the project in the strongest terms. These letters may be said to have killed the heiress presumptive; she was so much affected by them, that on the day after their receipt, the 28th of May, she was struck with apoplexy as she was walking in the gardens of Herenhausen, and expired in the arms of her daughter. The Princess Sophia, who was one of the most accomplished women of her time, was in her eighty-fourth year when her life was thus terminated. Queen Anne died on the 1st of August following, on which George, Elector of Brunswick, the son of the Electress Sophia, became king of Great Britain.

George I. was born the 28th of May 1660 (the day before that on which Charles II. made his entry into London at the Restoration). In 1681 he came over to England with the intention of paying his addresses to the Princess (afterwards Queen) Anne; but immediately after landing he received his father's orders not to proceed in the business, on which he returned home, and in the following year married his cousin Sophia Dorothea, the daughter of the Duke of Zell. He afterwards served in the armies of the Empire both against the Turks and the French. He succeeded to the electorate on the death of his father in 1693. In 1700 he led a force to the assistance of the Duke of Holstein, who was attacked by Frederick IV. of Denmark, and in conjunction with the Swedes under General Banier, compelled King Frederick to raise the siege of Tonningen. Hanover had been created a ninth electorate by the Emperor Leopold in 1692, but in consequence of the opposition of other electoral houses it was not till 1708 that the duke was admitted into the college of electors. Duke Ernest, the father of George I., had originally attached himself to the French interest, but his adhesion to England was of course secured by the settlement of the succession to the crown on his family, although it is probable that neither he nor even his son regarded that arrangement as very secure until the latter actually found himself seated on the throne. The elector George remained steady to the English alliance throughout the general war which began in 1702, and both in 1707 and the two following years he commanded the Imperial forces against the French. All the endeavours of the English ministry however could not prevail upon him to go along with them in the original propositions for the peace of Utrecht. In fact, he stood out till the conclusion of the treaty of peace between the French King and the Emperor, at Rastadt, 6th March 1714.

The accession of George I. took place as quietly, and as much like a thing of course, as any such change has ever done in the most settled times. The new king, with the prince his son, arrived at Greenwich on the 28th of September 1714. Before this the Tories, who had been in power at the death of Queen Anne, had all been dismissed by the Lords-Justices; and now a new ministry was formed, consisting, with the single exception of the Earl of Nottingham (who was removed within a year), wholly of Whigs, Viscount Townshend and the celebrated Mr. (afterwards Sir Robert) Walpole being its most influential members. A new parliament, which gave ministers a great majority in the Commons, having assembled in January 1715, immediately proceeded to the impeachment of Bolingbroke, Oxford, and their associates, all of whom were compelled for the present to bend to the storm. These determined (or, as some called them, vindictive) measures however probably did not do much to strengthen the position of the new dynasty. The rebellion in Scotland broke out before the end of the year, and was not completely put down till February 1716. One of the consequences by which it was followed was the repeal of the Triennial Act by the 1st George I. stat. 2, c. 38, entitled 'An Act for enlarging the time of continuance of parliaments,' by which it was declared that not only all future parliaments, but even the parliament then sitting, might be continued for seven years,—certainly one of the most daring assumptions of power upon which an English parliament has ever ventured. The year 1717 was ushered in with the rumour of an intended invasion of the country by Charles XII. of Sweden, who had been irritated by the recent purchase by the King of England, from the Danes, of the two duchies of Bremen and Verden, which the Danes had taken from Sweden in 1712. To counteract the designs of Sweden, to which the Czar Peter of Russia had been induced to become a party, George I. lost no time in arranging what was called the Treaty of Triple Alliance (concluded at the Hague 4th January 1717) with France and Holland. This war however was not marked by any operations of importance, and it was put an end to by the death of Charles XII. before the end of the following year. Meanwhile, in April 1717, the ministry of Townshend and Walpole was broken up by the dismissal of Townshend and the immediate resignation of Walpole—the result of internal dissensions which had been for some time growing, and of the intrigues of a section of the Whig party. The heads of the new cabinet were Mr. (afterwards Lord) Stanhope, who became first lord of the treasury and chancellor of the exchequer in the room of Walpole, and the Earl of Sunderland, who took the office of one of the principal

secretaries of state, Mr. Addison being taken in as the other. The intrigues of Cardinal Alberoni, which had also been at the bottom of the late demonstrations of hostility by Sweden, now led to a war with Spain. Here England was again cordially assisted by France, the Spanish minister's ambitious designs embracing at once the expulsion of the Hanoverian family from the government of England, and of the Regent Duke of Orleans from that of France. The Quadruple Alliance between Great Britain, France, the Emperor, and Holland was now arranged, and various military operations took place, the most distinguished of which was the victory obtained by Admiral Sir George Byng (afterwards Lord Torrington) over the Spanish fleet off the coast of Sicily (31 July, 1718), in which about fifteen of the enemy's ships were captured or destroyed. In June 1719, also, a Spanish force that had landed in Scotland, and had been joined by a body of Highlanders under the command of the Earl Marischal and Lord Seaforth, was defeated by General Wightman in an action fought at Glenshield, in Inverness-shire, and compelled to surrender at discretion—a check by which a second Jacobite rebellion was at once put down. The differences with Sweden however were finally accommodated by the treaty of Stockholm, signed the 20th of November 1719; and before the close of the same year Cardinal Alberoni was dismissed by the King of Spain, and peace was soon after made also with that power.

A concurrence of events now brought about a change of ministry. In April 1720 a reconciliation was effected between the king and the Prince of Wales, with whom he had been for some years at variance; this re-introduced Walpole, who had attached himself to the prince, into the ministry in the subordinate capacity of paymaster of the forces; and soon after the terrible explosion of the South-Sea scheme at once overthrew the administration of Stanhope and Sunderland by the extent to which several members of the cabinet were personally involved, and produced a crisis in which Walpole, with his great financial skill and reputation, found everything thrown into his own hands. He became first lord of the treasury and chancellor of the exchequer in April 1721, commencing from that date a premiership which lasted for twenty-one years, being the longest period that any English minister has continued in power since the time of Lord Burleigh. Of the transactions in domestic politics under the late administration, the most remarkable were the repeal in 1718 of the Schism Act, passed in the last year of Queen Anne—a repeal which, to his discredit, Walpole, actuated by considerations of party, opposed to the utmost, though happily without success; and the attempt of the ministers in 1718 and 1719 to carry their celebrated bill for the limitation of the peerage, in which they were defeated by the junction of Walpole with the Tories.

The pacific disposition of Walpole, and the continued friendship of France, both under the government of the Duke of Orleans and afterwards under that of Cardinal Fleury, tended to preserve the repose of Europe during the latter years of the reign of George I.; but it was, on the other hand, constantly endangered by the persevering intrigues of the adherents of the family that had been ejected from the British throne, and still more by the apprehensions of the king for the safety of his German dominions, and the entanglement of the country in continental politics through that connection. The most memorable event of 1722 was the detection of the conspiracy for bringing in the Pretender, in which the celebrated Atterbury, bishop of Rochester, was involved. War was at length rekindled by the alliance formed between the king of Spain and the emperor by the treaty of Vienna, signed the 30th of April 1725, and the treaty of Hanover, concluded the 3rd of September following, between England, France, and Prussia, to which Sweden afterwards acceded. The siege of Gibraltar was begun by Spain in February 1726, and a British fleet was about the same time sent to the West Indies under command of Admiral Hosier, where in consequence of contradictory or indecisive orders it remained inactive till the admiral and nearly all his crew perished of disease—a calamity which at the time occasioned a vehement outcry against the administration. Preliminary articles for a general pacification however were signed at Paris, 31st of May, 1727. On the 3rd of June following, King George embarked at Greenwich for Hanover, but had only reached Osanburg when he was struck with apoplexy, and died there in the night between the 10th and 11th of June, in the sixty-eighth year of his age, and the thirteenth of his reign.

By his unfortunate queen, who died on the 2nd of November 1726 at the castle of Ahlen in Hanover, in which she had been immured since 1694 on a charge, never proved and generally disbelieved, of an intrigue with Count Koningsmark, George I. had one son, George, by whom he was succeeded, and a daughter, Sophia Dorothea, born 16th of March 1687, and married in 1706 to King Frederick II. of Prussia. George I. has the credit of not having allowed himself to be influenced in affairs of state by the female favourites with whose society he solaced himself. Of these, the one who enjoyed his chief favour after he came to the English throne was Ermengard Melusine de Schulenberg, who in 1716 was created Duchess of Munster in the Irish peerage, and in 1719 Duchess of Kendal in the English peerage, for life; her niece, Melusine de Schulenberg (afterwards married to Philip, earl of Chesterfield) being also made Countess of Walsingham for life in 1722. This woman, who survived till 1743, the king is believed to have married with the left hand. His other chief mistress in his latter days was Charlotte

Sophia, wife of Baron Kilmarsack, countess of Platen in Germany, and created Countess of Leinster in Ireland, 1721, and Countess of Darlington in England, 1722, who died in 1730.

A fair share of the courage and obstinacy of his race, steadiness to his engagements and his friendships, and considerable sagacity in the management of affairs, were the marked qualities in the character of this king. He was to the end of his life however, in all his views and notions, and in his conduct, much more elector of Hanover than king of England; and his excessive anxiety about not merely the safety but the extension of his hereditary dominions, undoubtedly helped to involve this country in the net of continental politics to an extent not before known. Other circumstances of the time however also contributed to this result. George I. was a coarse-minded man, with little taste for literature, science, or the fine arts; but the country is indebted to him for the foundation in 1724 of a professorship of modern history in each of the universities.

It is impossible within the limits to which we are confined to attempt even the most general account of the changes made in the law by the many hundred pages of legislation which were added to the Statute-Book in the course of this reign. Among the most remarkable of the new laws may be mentioned the 1 Geo. I. st. 2, c. 5, commonly called the Riot Act; the 6 Geo. I. c. 5, which declared that the "kingdom of Ireland hath been, is, and of right ought to be subordinate unto and dependent upon the imperial crown of Great Britain; and that the British parliament had, hath, and of right ought to have, power and authority to make laws and statutes of sufficient force and validity to bind the kingdom and people of Ireland," but which was repealed by the 22 Geo. III. c. 53; the 9 Geo. I. c. 22, commonly called the Black Act (from the name of the 'Blacks' taken by one of the descriptions of depredators against which it is directed); and the 11 Geo. I. c. 26, entitled 'An Act for the more effectual disarming the Highlands in Scotland, and for the better securing the peace and quiet of that part of the kingdom.' The commencement of this reign also forms an important era in the history of the national finances, from the establishment in 1716, under the government of Walpole, of the first sinking fund on a great scale, by the 3 Geo. I. c. 7. The national debt, which amounted to about 52,000,000*l.* at the commencement of this reign, underwent no reduction in the course of it; but the interest was reduced from about 3,350,000*l.* to 2,217,000*l.* The power of effecting this reduction was principally obtained through the effects of an act passed in the last year of the preceding reign (the 12 Anne, st. 2, c. 16), by which the legal interest of money was reduced from six to five per cent.

GEORGE (AUGUSTUS) II., King of Great Britain, the only son of George I. and his queen Sophia Dorothea, was born at Hanover, October 30, 1683. On the 22nd of August 1705 he married Wilhelmina Caroline, daughter of John Frederick, margrave of Brandenburg-Anspach. On the 9th of November 1706 he was created a British peer by the title of Duke of Cambridge; but he never received a writ of summons to the House of Lords, nor indeed did he visit England till his father succeeded to the throne. The project that was at one time entertained of bringing him over has been noticed in the preceding article. In the war with France he served with his father in the army of the allies, and distinguished himself at the battle of Oudenarde, gained 11th of July 1708 by the Duke of Marlborough over the French forces commanded by the Duke of Burgundy.

On the death of Queen Anne he accompanied his father to England, and was declared Prince of Wales at the first privy council held by George I., 22nd of September 1714. The heir-apparent was immediately seized upon as an instrument of political intrigue. In the debates on the civil list in May 1715, one of the propositions of the Tories was to settle an independent revenue of 100,000*l.* per annum on the Prince of Wales, but the motion to that effect was negatived in the House of Commons by a great majority. The same sum however was allowed to the prince by the king out of the income of 700,000*l.* voted to his majesty by parliament. On the 5th of May 1715 the prince received the appointment of Captain-General of the Artillery Company, and on the 6th of July 1716 he was constituted guardian of the realm and lieutenant of the king during the king's absence in Hanover. While thus left to administer the government, he was present on the 6th of December at Drury Lane Theatre, when a lunatic of the name of Freeman, a man of property in Surrey, suddenly rushed towards the box where he was, fired at the sentinel who endeavoured to stop him, and severely wounded him in the shoulder, and was not secured without great difficulty, when three other loaded pistols were found about his person. In the general confusion and alarm the prince is said to have shown perfect presence of mind and self-possession. A quarrel between the king and the prince broke out on the 28th of November 1717, on occasion of the baptism of a son of which the Princess of Wales had been delivered on the 3rd of that month: the immediate cause of the rupture was the displeasure expressed by the prince at the Duke of Newcastle standing godfather with the king, instead of the king's brother, the Duke of York, whom he wished to have been appointed. The prince, as soon as the baptismal ceremony was over, addressed some very strong language to the duke; and the king, incensed at this public want of respect to himself, ordered the prince to keep his own apartment till his pleasure should be further known. Soon after the prince was desired to quit St. James's, on

which his royal highness and the princess went to the house of the Earl of Grantham in Albemarle-street. The children however, by the king's order, remained at St. James's; and shortly after the judges being consulted, decided, by a majority of ten to two, that the care of the education of the royal family belonged of right to the king. (See an account of the proceedings in Hargrave's 'State Trials,' xi. 295-302.) At this time the family of the Prince of Wales consisted of a son, Frederick Lewis, born in 1707, and three princesses, Anne, born 1709, Amelia, born 1711, and Caroline, born 1713, besides the infant prince George William, who died in the beginning of the following year. On the 24th of December his majesty's pleasure was formally signified to all the peers and peeresses, and to all privy-councillors and their wives, that all persons who should go to see the Prince and Princess of Wales should forbear coming into his majesty's presence; such persons also as had employments both under the king and prince were obliged to quit the service of one of them. The prince, on his part, took up his residence in Leicester-House, where he kept his own court, and lived in open resistance to his father. The king formed a household for the young princesses, and on the 10th of January 1718 he created his grandson, Prince Frederick Lewis, duke of Gloucester.

The king paid another visit to Hanover in May 1719. On this occasion "the Prince and Princess of Wales," says Tindal, "not being appointed regents, retired into the country, and appeared no more till the king's departure, a few days after which they came to St. James's to see the young princesses, who kept a levee twice a week; and to them it was that the lords-justices and a numerous appearance of foreign ministers, nobility, and gentry, made their compliments on the king's birthday." It is believed that the famous Peage Bill of this year [GEORGE I.] was brought forward chiefly in consequence of the quarrel between the king and his son, and with the view of limiting the powers of the latter when he should come to the throne. In the final discussion which it underwent in the House of Commons in November, Sir John Packington observed that some persons had through indiscretion occasioned an unhappy difference in the royal family, and he was apprehensive if that bill, so prejudicial to the rights of the next heir, should pass into a law, it might render that difference irreconcilable. The allusion here was understood to be to the Earl of Sunderland, then first lord of the treasury and prime minister, the mover and most zealous promoter of the bill.

The reconciliation of the king and the prince was at last effected in April 1720, chiefly by the endeavours of the Duke of Devonshire and Mr. Walpole, who had for some time past attached themselves to the court of his royal highness. On the 23rd of that month an interview took place between the father and son; and the termination of their difference was immediately announced to the public by the prince, on his return to Leicester-House, being attended by a party of the yeomen of the guard and of the horse-guards, and by the foot-guards beginning to mount guard at his house. The reconciliation however was probably never very cordial. It may be observed that when the king immediately after this set out to pay another visit to his continental dominions, he left the government in the hands of the lords-justices, as on the last occasion. A story is told by Horace Walpole which appears to show that the king's animosity lasted to the end of his life. After having destroyed two wills which he had made in favour of his son, he had intrusted a third, supposed to have been of an opposite character, to the keeping of Wake, archbishop of Canterbury, who on the accession of George II. presented it to the new king. To the surprise of every one present, his majesty, putting it into his pocket, stalked out of the room, and the will was never heard of more. Lord John Russell, in relating this story ('Memoirs of Affairs of Europe,' ii. 396), observes that "by the law of England the will would not have been valid; all property, real as well as personal, of the king, descends with the crown." It does not appear to be now understood that this is law. Walpole states that another copy of the will, which is believed to have bequeathed large legacies to the Duchess of Kendal and her niece Lady Walsingham [GEORGE I.], had been deposited with the Duke of Brunswick, but that the silence of the duke was secured by a subsidy, and that the acquisition of Lord Chesterfield (the husband of Lady Walsingham, who threatened a suit in chancery), was obtained by a payment of 20,000*l.* (Walpole's 'Memoirs,' ii., 459, and see Mahon's 'England,' close of chap. xiv.)

George II. succeeded his father, June 10, 1727. It was at first his intention to place at the head of the government Sir Spencer Compton (afterwards Earl of Wilmington), who was then the speaker of the House of Commons; but when that person received the royal commands to draw up the declaration to the privy-council, he was obliged to call in Walpole to assist him. Queen Caroline, whose influence with her husband was very great, now interposed; and the result was that Walpole was continued in office. The war with Spain was finally terminated by the treaty of Seville, concluded 9th of November 1729; and for ten years from this time Walpole contrived to preserve peace. New causes however of dissatisfaction with Spain arose, principally out of alleged interferences of that power with the freedom of English commerce; and the minister at last found it impossible to resist the cry of the country for a new war. Hostilities were commenced in the close of 1739; and the reduction of Portobello, on the isthmus of Darien, by Admiral Vernon, in the beginning of

the following year, still further sharpened the eagerness with which the popular feeling had rushed into the contest. The operations that were subsequently attempted however were not equally successful; repeated attacks upon Carthage, in particular, all signally failed. The death of the emperor Charles VI. in October 1740, speedily produced a general European war; Great Britain supporting the settlement called the Pragmatic Sanction, by which the succession to the Austrian dominions devolved upon the late emperor's eldest daughter, Maria Theresa, queen of Hungary; France and Spain uniting to maintain the claims of Charles Albert, elector of Bavaria (elected emperor in 1742 under the title of Charles VII.). Meanwhile various causes had been co-operating to shake Walpole's power. The mere length of his tenure of office had tired the country and created impatience for a change. The pacific policy in which he had so obstinately persevered had disgusted the general eagerness for a war excited by a feeling that the national interest and honour alike demanded recourse to arms, and the course he had taken in this respect had impaired his reputation as much as his popularity. His scheme for the extension of the excise, introduced in 1733, had, although abandoned, produced an unfavourable impression that sunk deep into the popular mind, and an outcry against him that never subsided. The loss of his steady and influential protectress, Queen Caroline, who died 20th of November 1732, deprived him of one of his strongest supports in the favour of the king. Just before that event also a violent quarrel had broken out between the king and the Prince of Wales, who now headed the opposition, and collected around him at Leicester-House a court and party, one of the chief of whose avowed objects was the removal of the premier. In these circumstances a new parliament met 4th of December 1741, in which Walpole soon found himself so placed as to make it necessary to retire. He resigned all his places in the end of January 1742, and was immediately created Earl of Orford. So long as he lived however, which was not more than three years, Walpole continued really the king's chief adviser. The ministry that immediately succeeded was nominally appointed by his great rival Pulteney, but it was in reality the result of a compromise, and Pulteney himself was by Walpole's contrivance annihilated in the very moment of his apparent triumph, by being compelled to leave the House of Commons and to take a peerage: as Earl of Bath he became at once nobody. A reconciliation at the same time took place between the king and the prince; but neither this nor any of the other arrangements lasted long. In a few months the prince was again in opposition, and the new ministry was assailed by an adverse force, composed in part of their ancient allies, as formidable as that which had driven Walpole from power.

Meanwhile the war against the Bavarians and their allies the French had begun to be prosecuted with great vigour; the kings of Denmark and Sweden (the latter in his capacity of landgrave of Hesse Cassel) having been subsidised, and a treaty of alliance concluded with Frederick III. of Prussia, George II. joined his army on the Continent in person in the beginning of June 1743, and on the 26th of that month shared in the great victory gained over the French at Dettingen. On this occasion the English king behaved with distinguished courage. This instance of success however was only followed by inactivity and reverses; one consequence of which was the expulsion from the ministry, in November 1744, of Lord Granville (formerly Lord Carteret), the great promoter of the war, and as such the member of the cabinet who had the greatest influence with the king. The ministry that was now formed was called the Broad-Bottom ministry: it contained a few Tories, but consisted principally of the Newcastle and Grenville Whigs, the only parties wholly excluded being the connections of lords Granville and Bath. Mr. Pelham, brother of the Duke of Newcastle, was first lord of the treasury and chancellor of the exchequer, and Mr. Pitt (afterwards so distinguished both under that name and as Earl of Chatham) being promised a place as soon as the king could be induced to admit him, gave his support in the meantime to the administration. This change of men however brought no change of measures. The king's German politics continued to receive the same support from the new ministry as they had from the old. Nor was the war carried on with better fortune. The defeat of the allies at Fontenoy, 30th of April 1745, was the great event of the next campaign.

In August of the same year another Jacobite rebellion, instigated by France and Spain, broke out in Scotland; the towns of Dunkeld, Perth, Dundee, Edinburgh, and Carlisle rapidly fell into the hands of the insurgents; the king's troops were routed at Preston-pans and Falkirk; and the Pretender, Charles Edward, had already advanced as far as Derby in his bold march upon the metropolis of the empire before any successful attempt was made to resist him. The rising however which had wore so threatening an aspect was completely put down by the victory of Culloden, gained by the king's second son, the Duke of Cumberland, on the 16th of April 1746. In the preceding February, in the very midst of the public alarm, the king had made a sudden attempt to reinstate lords Granville and Bath as the heads of the ministry; but after being three days in office they saw that the project was hopeless, on which Mr. Pelham, who had resigned, was taken back, and continued at the head of affairs till his death in 1754.

The treaty of Aix-la-Chapelle, the preliminary articles of which

were signed on the 30th of April 1748, at last put an end to the war, the latter years of which were distinguished by some brilliant naval successes on the part of Great Britain. The conditions of this peace on the whole excited great dissatisfaction in England, especially the restoration of Cape Breton, which had been taken from the French in 1745, and had been accounted the great acquisition of the war. On the other hand, Madras, which a French fleet had reduced in 1746, was recovered. The power of the ministry however was not shaken by the vigorous and persevering assaults upon the treaty by the opposition in parliament; and Mr. Pelham and his friends also triumphed in a division that broke out in the cabinet after the death of the Prince of Wales (20th of March 1751), on the subject of the Regency Bill, rendered necessary by that event, when the Pelhams, to whom Mr. Pitt attached himself, were opposed by the party of the dukes of Cumberland and Bedford, and their protégé, Mr. Fox—the origin of a long and in its issues very important rivalry. But the death of Mr. Pelham (6th of March 1754) produced a succession of new contentions, intrigues, and changes. At last, in November 1755, Pitt and his friends were dismissed, and Fox, as secretary of state and manager of the House of Commons, became, under the Duke of Newcastle, who since his brother's death had held his offices and nominal station, the moving spirit of the ministry.

Meanwhile however war had again broken out with France in the preceding June. In one quarter of the world indeed, in India, the French and English, as allies of the conflicting native powers, can scarcely be said to have ever laid down their arms. But the new quarrel of the two governments took its rise from a disagreement about the boundaries of their respective possessions in North America, which had been left unsettled by the late treaty. This war, in which all the principal European powers were eventually involved, is known by the name of the Seven Years' War. Its commencement was extremely disastrous to the English—Minorca and Calcutta having both fallen to the French in the summer of 1756. The popular indignation excited by these reverses overset the administration of the Duke of Newcastle. Deserted by Mr. Fox, his grace resigned in the beginning of November; and by the end of December, Pitt, who had for some time past attached himself to the court of the young Prince of Wales at Leicester-House, was secretary of state, with a cabinet composed of his own friends and those of Lord Bute. The antipathies of the king however, and the intrigues of the Duke of Newcastle, overthrew this arrangement in a few months. In April 1757, Earl Temple, who held the office of first lord of the admiralty, having been dismissed, Mr. Pitt immediately gave in his resignation. It was some time before anybody could be induced to accept the task of constructing a new cabinet; at last, in the beginning of June, after the country had been for nearly two months without a government, the Earl of Waldegrave was appointed first lord of the treasury, with Mr. Fox as secretary of state. This administration lasted only for a few days; the king was then informed that he must seek for other aid. After some further negotiation, Mr. Pitt was before the end of the month recalled and appointed premier, with the office of secretary of state, the Duke of Newcastle being made first lord of the treasury, and Mr. Fox paymaster of the forces. This arrangement subsisted to the end of the reign. From the moment in which the chief direction of affairs was thus placed in the hands of Mr. Pitt the war was prosecuted with extraordinary vigour and success. In January 1756 a treaty of alliance had been contracted with Prussia, and an alliance between Austria and France was concluded in May of the same year. The commencement of active hostilities between Austria and Great Britain signalled Mr. Pitt's accession to power. In Germany the enemy were early in 1758 driven out of Bremen and Verden, which they had overrun the preceding year; soon after, Senegal, Goree, and other possessions of the French on the coast of Africa, were reduced; in 1759 the great victory of Minden, gained (August 1st) by Ferdinand, the hereditary prince of Brunswick, drove back the French to the Rhine; by a succession of brilliant successes at sea the French navy was almost annihilated; the victory on the heights of Abraham, in which Wolfe fell (September 13th) all but completed the conquest of Canada; Cape Breton, in the same quarter of the globe, had been already recovered; in the east, Clive had recovered Calcutta (2nd of January 1757), taken Chandernagore (March 14th), overthrown the Subahdar of Bengal at the great battle of Plassy (June 23rd), and was now engaged in driving the French from every remaining possession they had held in India. In the midst of these successes George II. expired suddenly at Kensington, from the extraordinary circumstance of a rupture of the right ventricle of the heart, on the 25th of October 1760, in the seventy-seventh year of his age and the thirty-fourth of his reign. His children by his queen, besides those that have been already mentioned, were, William Augustus, born 1721, created in 1726 duke of Cumberland; Mary, born 1723, married 1740 to Frederick, landgrave of Hesse Cassel; and Louisa, born 1721, married 1743 to Frederick V., king of Denmark. He was succeeded by his grandson, George III.

In his sentiments and politics George II. was as much a German as his father, and he persevered throughout his reign in the same system of interference in the affairs of the continent, professedly with the object of maintaining the balance of power, but really with an especial view to the preservation of the hereditary possessions of his

family. Though his Hanoverian partialities however occasioned considerable outcry when the wars in which the country was engaged were unfortunate, all this was forgotten in the splendid successes which at the close of his reign crowned the British arms both by sea and land, and at the moment of his death George II. perhaps enjoyed more popularity than any prince that had for a long period sat on the English throne. Both morally and intellectually his character seems to have very much resembled that of his father; he is said to have been somewhat passionate, but open, straightforward, and placable, though apt to entertain antipathies of considerable obstinacy, as well as steady in his attachment to those who had once attracted his regard. The only study to which he had any partiality was the art of war, in which he conceived himself to be a great adept. His queen Caroline was a woman of considerable strength of character as well as of cultivated mind, and as long as she lived she exercised great influence over her husband. There was a succession of royal mistresses however in this reign, as well as in the preceding. When George II. was prince of Wales he fell or professed to fall violently in love with the reigning beauty of the day, Mary, daughter of John, lord Bellenden, who was one of the princess's maids of honour; she however rejected his proposals, and married Colonel Campbell, one of the grooms of his bedchamber, who many years after became Duke of Argyll. On this the prince attached himself to Mrs. Howard, who succeeded to her place in the household of his wife, and she long continued to hold notoriously the situation of the king's first female favourite, though her influence, it is said, was never equal to that of the queen. Another of the king's mistresses was Amelia Sophia de Walmoden, who in 1740 was created countess of Yarmouth for life—the last instance of this scandalous abuse of the royal prerogative, and prostitution of the honours of the state.

Of the mass of legislation added to the Statute-book during this reign no very large portion retains any importance at the present day. Among the measures most deserving of notice may be mentioned, the Act 4 Geo. II., c. 26, ordering that all proceedings in courts of justice in England, and in the Court of Exchequer in Scotland, should be in the English language (two years afterwards extended to Wales); the 8 Geo. II., c. 6, establishing a Registry of Conveyances, Wills, &c., in the North Riding of Yorkshire; the 8 Geo. II., c. 13, which established a copyright in engravings; the 9 Geo. II., c. 5, repealing the old statutes against witchcraft; the 10 Geo. II., c. 28, prohibiting the acting of any new stage play without permission of the lord chamberlain (this was occasioned by some theatrical ridicule directed against Walpole); the 18 Geo. II., c. 15, separating the surgeons of London from the barbers; the 19 Geo. II., c. 30, entitled an Act for the more effectual disarming of the Highlands in Scotland, and for restraining the use of the Highland dress, &c.; the 20 Geo. II., c. 30, allowing persons impeached of high treason to make their full defence by counsel; the 20 Geo. II., c. 43, abolishing heritable jurisdictions in Scotland; the 20 Geo. II., c. 50, taking away the tenure of Wardholding in Scotland, and converting it into Blanch- and Feu-holdings; the 24 Geo. II., c. 23, establishing the use of the New Style; the 26 Geo. II., c. 2, for purchasing the museum of Sir Hans Sloane and the Harleian manuscripts, the foundation of the British Museum; the 26 Geo. II., c. 26, being an act permitting Jews to be naturalised by parliament without taking the sacrament, which however was repealed the following year; and the 26 Geo. II., c. 33, commonly called the Marriage Act.

The national debt was considerably more than doubled in the course of this reign; its amount at the conclusion of the Seven Years' War, in 1763, was nearly 139,000,000*l.*, paying an interest of above 4,850,000*l.* The annual parliamentary grants, which at the beginning of the reign usually amounted to about three millions, or three millions and a half, rose at its close to twelve, fifteen, and at last to nineteen millions. The country nevertheless undoubtedly made great progress in wealth and general improvement during the reign of George II. Commerce and manufactures were greatly extended; both the useful arts and those that embellish life found a demand and encouragement that was constantly increasing; and various branches both of literature and science were cultivated with considerable ardour and success.

GEORGE (WILLIAM FREDERICK) III., the eldest son of Frederick Lewis, prince of Wales, was born on the 4th of June 1738. His mother was Augusta, daughter of Frederick II., duke of Saxe-Gotha, born in 1719, married to the Prince of Wales on the 25th of April 1736. Their other children were—1, Augusta, born 1737, married in 1764 to Charles William Ferdinand, duke of Brunswick Wolfenbützel, died 1813; 3, Edward Augustus, born 1739, created Duke of York 1760, died 1767; 4, Elizabeth Caroline, born 1741, died 1769; 5, William Henry, born 1743, created Duke of Gloucester 1764, died 1805; 6, Henry Frederick, born 1745, created Duke of Cumberland 1766, died 1790; 7, Louisa Anne, born 1749, died 1768; 8, Frederick William, born 1750, died 1765; 9, Caroline Matilda, born 1751 (four months after her father's death), married to Christian VII., king of Denmark, 1766, died 1774.

On the death of his father on the 20th of March 1751, Prince George succeeded to the title of the Duke of Gloucester, but he was created Prince of Wales on the 20th of April. His mother, under whose care he then remained, soon disengaged herself from, or was deserted by,

the leaders of the parliamentary opposition which had gathered around and made a tool of her husband; but the king's habitual dislike to her appears never to have been overcome. It has been asserted that, encouraged by the manner in which the princess was treated by the rest of the royal family, the prince's governor, Lord Harcourt, and his preceptor, Dr. Hayter, bishop of Norwich, exerted their influence to prejudice him both against the old friends of his father and against his mother herself. Another account is that the princess was prejudiced against the governor and the preceptor by Lord Bute, who now became her confidential adviser. [BUTE, EARL OF.] From whatever cause, Lord Harcourt and the bishop resigned their places in December 1752; the ground which they assigned was that Mr. Stone, the prince's sub-governor (placed in that situation by the ministry), Mr. Scott, another tutor (who had been recommended to the late prince by Lord Bolingbroke), and Mr. Cresset (who had been appointed treasurer of the prince's household on the recommendation of his mother), were all concealed Jacobites. Stone, it was affirmed, had about twenty years before actually drunk the Pretender's health in public. This charge, in which Dr. Johnson, bishop of Gloucester, and Mr. Murray, afterwards the celebrated Lord Mansfield, were also involved, was made the subject not only of an inquisition by the cabinet, but afterwards of a debate in the House of Lords. It appears to have rested on little or no evidence, and the charge, in itself an abundantly ridiculous one, wholly broke down under judicial investigation. Lord Waldegrave was soon after appointed the prince's governor, and Dr. John Thomas, bishop of Peterborough (afterwards of Salisbury, finally of Winchester), his preceptor; and under their management and the more influential superintendence of Lord Bute, matters proceeded without further dissension. The prince was kept by his mother in great privacy, and permitted to associate only with a very small and select circle. Her royal highness seems to have been actuated by good intentions; she was anxious to preserve her son from the contamination of the fashionable profligacy of the day; and in this respect her method may be allowed to have been successful. But in regard to anything beyond this, both her own notions and those of the persons in whose hands she placed herself were narrow in the extreme. One of her complaints to Dodington against the Bishop of Norwich was that he insisted upon teaching the prince and his brothers logic, "which, as she was told, was a very odd study for children of their age, not to say of their condition." Bute indeed appears to have felt the propriety of some political instruction being given to the heir-apparent; but his lordship, although he soon after adventured upon the office of prime-minister, had himself scarcely any practical acquaintance with political matters, and had never made that department of knowledge his study. Independently therefore of his party prejudices, which gave him a general bias towards what would now be called by most people antiquated and illiberal opinions, he was from mere ignorance of the subject a very unfit director of the political studies of the prince; nor were any of his coadjutors or subordinates much more competent. Their pupil accordingly can scarcely be said to the end of his life to have mastered even the details and conventional forms of political science. In 1759, when he had attained his majority, the prince took his seat in the House of Peers; but there is no record of his having taken any part in the business of the House.

George III. succeeded to the throne on the death of his grandfather, October 25, 1760. Of his eventful reign of nearly sixty years we can here attempt only a very rapid sketch. On the 8th of July 1761 the young king surprised his council by the unexpected announcement of his intention to marry the Princess Charlotte Sophia, second daughter of Charles Lewis Frederick, duke of Mecklenburg-Strelitz. The marriage took place on the 8th of September following. It is understood that in determining upon this union the king had the merit of sacrificing a private attachment to what were deemed considerations of political expediency. Throughout his reign indeed he never showed himself deficient in the strength of character necessary to make everything else bend to what he held to be the demands of his public position. The youth and unblemished moral character of George III., and the circumstance of his having been born in the country, excited much popular regard and expectation on his accession to the throne. From the first however he did not conceal his anxiety for an end of the war which was then urged with so much national enthusiasm. Lord Bute, who had immediately on the commencement of the reign been admitted into the privy council, and made groom of the stole, was in a few months brought into the ministry, with the design probably of effecting that object. He was made secretary of state in March 1761. In the beginning of the following October Mr. Pitt resigned, on finding himself opposed by a majority of the cabinet when he proposed to anticipate the designs of Spain by declaring war against that power. The war with Spain, which he had predicted as inevitable, broke out in January 1762; but in the beginning of June Bute became premier on the resignation of the Duke of Newcastle; and on the 3rd of November the preliminaries of peace between France and England were signed at Fontainebleau. By the treaty of Paris, concluded 10th of February 1763, between Great Britain, France, Spain, and Portugal, this country retained possession of Canada, acquired Florida by cession from Spain, and recovered Minorca, but gave up Belleisle, the Havannah, and all the settlements taken from France in the East Indies. An attempt was made by the opposition

to excite dissatisfaction with this treaty, but it was not very successful. Bute however resigned on the 8th of April, not so much, it would appear, in consequence either of any opposition in parliament or any unpopularity out of doors, as from want of support in the cabinet. He was succeeded by Mr. George Grenville, who was for some time however generally looked upon as merely the lieutenant of the retired minister. Mr. Grenville's administration commenced ominously with the famous contest with Wilkes, arising out of the publication of the forty-fifth number of his 'North Briton,' on the 19th of April. This business, and the question of general warrants which was involved in it, occupied much of the early part of the following session of parliament. The close of the same session in April 1764, was made memorable by the passing of the first resolutions asserting the expediency of imposing certain stamp-duties upon the colonies in America. A bill actually imposing such duties was brought forward the next session, and received the royal assent March 22, 1765.

In the meantime however various circumstances had concurred to shake the ministry. In the preceding April the king had been attacked by an illness generally supposed to have been the same mental malady with which he was afterwards visited oftener than once in a more serious form. On his recovery, which took place in a few weeks, he proposed that a bill should be brought into parliament empowering him to appoint the queen or any other member of the royal family to act, in case of his demise, as regent during the minority of his successor. The real author of this proposition was, no doubt, Lord Bute. The ministers had of late attempted to throw off his lordship, but on this occasion they did not venture openly to oppose the king's wish; they only attempted, when the bill was on its way through parliament, to exclude from it the name of the Princess Dowager of Wales. In this however they were signally defeated; a motion having been made in the Commons that the name of the princess should be inserted, the influence of the court and of Lord Bute were sufficient to carry it against ministers by the large majority of 167 to 37. The rising discontents in America came soon after, still further to embarrass Mr. Grenville and his colleagues. It was not however till after a great deal of negotiation that the king found himself strong enough to give them their dismissal.

At last, on the 10th of July 1765, a new ministry was formed, with the Marquis of Rockingham at its head. This ministry, though not without considerable hesitation, repealed the American Stamp Act; the bill to that effect received the royal assent on March 20th 1766, and for the present this measure effectually allayed the disturbances in the colonies. The Rockingham ministry however soon came to an end, partly from inadequate support in parliament, partly from the lukewarmness of the court, but chiefly from internal dissensions, if not treachery in some of its members. Soon after the prorogation of parliament in the beginning of June, Mr. Pitt was sent for by the king; and by the beginning of August that gentleman, transferred to the House of Lords with the title of Earl of Chatham, was at the head of a new cabinet. It was during this administration that on the 2nd of June 1767 Mr. C. Townshend, the chancellor of the exchequer, brought forward that renewed measure of American taxation which eventually led to the independence of the colonies. This is believed to have been Mr. Townshend's own scheme, Lord Chatham, though still the nominal head of the cabinet, being now in such a state of health, and so much at variance with the majority of his colleagues, that it is said he was never even consulted in the matter. Mr. Townshend died suddenly on the 4th of September, on which Lord North was appointed chancellor of the exchequer, and the ministry from this time came to be generally known as that of the Duke of Grafton, who held the office of first lord of the treasury. Lord Chatham at last resigned, October 15th, 1768. With the meeting of parliament in the preceding June commenced the second and much more protracted struggle of the government with Wilkes, occasioned by his return for Middlesex, his expulsion by the house, and his repeated re-election.

Meanwhile, the new plan of colonial taxation had thrown all English America into commotion as soon as it was announced. The beginning of the next year, 1769, was distinguished by the appearance of the first of the celebrated 'Letters of Junius,' the most effective series of political attacks ever directed against a ministry. The Duke of Grafton, the object of the most venomous shafts of this invisible assailant, suddenly resigned, January 23rd 1770. On this Lord North became premier, and began his administration with a bill, brought in March 5, for the repeal of all the lately-imposed American duties, except the duty on tea, which was retained avowedly merely to assert the right of taxation. This exception however produced the war with the colonies, and their eventual separation. A dispute with Spain about the possession of the Falkland Islands occupied attention for a short time in the latter part of this year, but was eventually adjusted without leading to hostilities. The session of parliament which terminated on May 8th 1771 is memorable for the successful assertion by the newspaper press of the right of reporting the debates, after a contest with the House of Commons which lasted from the beginning of February to the end of April, and for two months of that time almost wholly occupied the house. This and the following year were also marked by some important events in the royal family. In the summer of 1771 the king's third brother, the Duke of Cumberland,

married Mrs. Horton, daughter of Lord Irnham (afterwards Earl of Carhampton), and widow of Christopher Horton, Esq. His majesty, as soon as the affair was publicly announced, forbade the duke and duchess to appear at court; but this did not deter his second brother, the Duke of Gloucester, from avowing, a month or two afterwards, his marriage with the Countess-Dowager of Waldegrave (daughter of Sir Edward Walpole), which had taken place six years before. The Royal Marriage Bill was in consequence brought into the House of Lords, and, notwithstanding a strenuous opposition, passed into a law. By this statute (12 Geo. III. c. 11) all descendants of George II. (except the issue of princesses married into foreign families) are prohibited, while under the age of twenty-five, from contracting marriage without the consent of the king, and without the consent of parliament if above that age. The king's mother, the Princess-Dowager of Wales, died on the 8th of February 1772. Only a few days before had occurred at Copenhagen the catastrophe of the king's youngest sister, the Queen of Denmark, who was suddenly thrown into confinement, by order of her imbecile and dissolute husband, on a charge of adultery with his physician Struensee. No proof of the criminality of the parties ever was produced, though both Struensee and his friend Brandt were put to death without trial. The queen was sent in the first instance to the castle of Cronsborg; but after being confined there for about four months the interposition of her brother procured her release, and she was conveyed first to Stade and afterwards to Zell in Hanover, where she lived in retirement till her death, May 10th 1774.

The disturbances in America, excited by the tea duty, broke out in the summer of 1773. The Gaspé schooner was attacked and burned at Providence, in Rhode Island, in June; the destruction of the tea by the mob at Boston took place in December. Another year however was spent before the quarrel assumed the character of a regular contest of arms. Hostilities commenced with the battle of Lexington, April 19th 1775; that of Bunker's Hill followed on the 16th of June. Still the resistance of the colonists had not taken the form of an avowed determination to throw off the dominion of the mother-country. It was not till the ever-memorable 4th of July 1776 that the contest was brought to this point by the Declaration of Independence. In the course of the next year many French officers joined the Americans, and it became evident that the governments both of France and of Spain were about to take part publicly with the revolted colonies. Meanwhile, on the 16th of October, the convention of Saratoga, and the surrender of Burgoyne, inflicted the first great blow upon the British cause. On the 6th of February 1778 a treaty was signed between the Americans and France, in which their independence was acknowledged. War between England and France of course immediately followed this act. In June 1779 Spain too at last openly joined the hostile confederacy; and before the end of another year England had found still another enemy in Holland. The convention of the northern powers of Russia, Denmark, and Sweden (soon after joined by Holland, Prussia, and the Emperor), for the maintenance of what was called the armed neutrality—being in fact a defiance of the power of Great Britain to enforce the commonly-recognised rights of belligerents—was also established in the course of the year 1780. At home this was the year of the Protestant riots, when London was for nearly a week in the hands of a devastating mob, which was not put down till after a great effusion of blood, as well as destruction of property. The popular mind in Ireland moreover was in a state which occasioned the greatest alarm: the inhabitants were embodied as volunteers to the number of fifty or sixty thousand, and the British parliament had already in the beginning of this year been compelled to yield to some, and was soon to be forced to concede more, of the demands of these petitioners with arms in their hands.

Meanwhile the nation was becoming heartily tired of the war; and the ministry, surrounded by so many embarrassments, stood at the lowest point of unpopularity. These feelings continued to increase in the public mind as new failures and calamities further demonstrated the incapacity, or the ill fortune, with which the affairs of the country were conducted. Even in the East, where the French had at the commencement of the war been again driven from all their settlements, the successes of Hyder Ali now seemed to be fast changing the face of affairs. In America the surrender of Lord Cornwallis at Yorktown, on the 19th of October 1781, in effect terminated the struggle. Lord North and his colleagues resigned on the 20th of March 1782, on which the Marquis of Rockingham was once more placed at the head of a new ministry; but his death about three months after his acceptance of office again overthrew all the arrangements that had been made. Lord Shelburne having succeeded to the place of first lord of the treasury and premier, Mr. Fox and all his friends immediately resigned. Among the new appointments was that of Mr. Pitt to the office of chancellor of the exchequer, in the room of Lord George Cavendish. It is said to have been by the persuasions of Lord Shelburne that the king was at last, after extreme reluctance, prevailed upon to consent to acknowledge the independence of the colonies. The preliminaries of a peace were signed at Paris on the basis of that acknowledgment on the 30th of November, and on the 3rd of September 1783 the war, which had resulted in so large a curtailment of the dominions of the British crown, was formally brought to a close by the signature of definitive treaties with America, France, and Spain. Peace with Holland was also concluded at Paris, June 20th, 1784.

In the meantime however the famous coalition between the followers of Mr. Fox and of Lord North, parties which had been so long and so bitterly opposed, had succeeded in the beginning of April 1783 in driving Lord Shelburne and his friends from power. Lord North and Mr. Fox now became secretaries of state together, with the Duke of Portland as first lord of the treasury and nominal premier. This arrangement however was soon overthrown. The new cabinet was exposed from the first to a storm of public outcry, and this greatly aided the determined efforts of the crown to shake itself free from a ministry that had been forced upon it. The only strength of the coalition indeed lay in the existing House of Commons. The defeat of Mr. Fox's India Bill in the House of Lords by the private exertion of the influence of the crown, 17th of December, on the question of going into committee, was followed the next day by the dismissal of both Fox and North, and the immediate appointment of a new ministry with Mr. Pitt at its head. The contest of parties which ensued is the most memorable in the annals of parliament. It was only terminated by the dissolution of the parliament, 24th of March 1784, and the overwhelming majority of supporters which the result of the elections gave to the court and the ministry in the new House of Commons. Throughout this long and violent struggle, Mr. Pitt's own firmness and resolution were seconded by the steady support of the king, who is said to have openly declared his determination, rather than receive back Mr. Fox as minister, to resign his crown and retire to Hanover.

The formidable front presented by the Irish volunteers in the season of the national difficulties and disorders had extorted from the British parliament, in 1782 and 1783, the repeal of the restrictive statute of 1720 (GEORGE I.) and the acknowledgment (by the 23 Geo. III., c. 28) of the complete independence of the parliament of Ireland. Both in Ireland and in England the agitation of the question of parliamentary reform occupied public attention for some time after the conclusion of the war; but it was productive of no results. On the 2nd of August 1786, an attempt was made upon the king's life by a madwoman named Margaret Nicolson, who struck at him with a knife as he was alighting from his carriage at St. James's, but missed her aim. In November 1788, his majesty was visited with a second and more serious attack of illness, which was admitted to be delirium, and from which he did not recover till the following March. On this occasion Mr. Fox and his friends contended that the powers of the government devolved as of right upon the Prince of Wales; but parliament stood by Mr. Pitt in his opposition to that doctrine, and a bill conferring the regency upon the prince with certain restrictions had nearly passed both houses when the king recovered. The parliament of Ireland in the mean time had made use of their lately acquired independence to offer the prince the government of that kingdom, without any restrictions. As the prince had attached himself to the party of which Mr. Fox was the head, expectations of important political changes were excited by the prospect of his royal highness becoming the head of the state.

The quiet which had for some years reigned in Europe was broken in 1789, by what soon became the all-absorbing subject of interest, the Revolution in France. The history of the remainder of the reign is chiefly that of the share borne by England in the wars which grew out of that great convulsion. Whatever may have been the inclination of the court, there can be no doubt that Mr. Pitt was reluctantly drawn into the war with France. The demand however that the country should take up arms was loudly made by the large section of the Whig body, which, with Mr. Burke for its soul, went over to the ministry in 1792 and 1793; and this was also decidedly the general voice of the country. In point of fact, war was at last declared, not by England, but by France, on the 1st of February 1793, a few days after the execution of the French king.

The general course of the war, almost from its commencement to its close, has already been sketched in the article BONAPARTE—NAPOLEON I. We shall here merely enumerate in their chronological order the principal events more immediately belonging to English history.

Conventions were, immediately on the declaration of war, made for carrying on operations against France with Naples, Sardinia, Prussia, the Emperor, Hesse-Cassel, Baden, Hesse-Darmstadt, Brunswick, and by George III. with himself in his capacity of Elector of Hanover. A treaty of mutual alliance with Holland already subsisted. Spain and Portugal also immediately became parties to the war. Finally Russia still professed to adhere to the combination against France, though the real object of the Empress Catharine was merely the partition of Poland, which she soon after effected in association with Austria and Prussia. The first military measure of the British government was to send a force to Holland under the command of the Duke of York. In the campaign of 1793 the French were expelled from Flanders by the Austrians; and the allied army under the Prince of Saxe-Coburg and the Duke of York took Valenciennes and Condé. The duke however was afterwards repulsed with great loss in an attempt upon Dunkirk. Toulon was taken possession of by Lord Hood, but speedily recovered by the French. In 1794 the French fleet was signally defeated by Lord Howe in the Channel on the 1st of June; the English also became masters of Corsica. In 1795 the islands of Martinique, St. Lucia, and Guadaloupe in the West Indies, were taken from the French; Guadaloupe however was soon after retaken. The people of Holland now drove out the stadtholder, and with the assistance of the

French established what was called the Batavian Republic; on this the Cape of Good Hope, Ceylon, and other Dutch possessions in the East Indies were seized by England. Peace was made with France by Prussia April 5th, and by Spain July 22nd. In 1796 the English were compelled to withdraw from Corsica; on the 5th of October Spain declared war against England; in the latter part of the same month an ineffective attempt was made to open negotiations for peace by the mission of Lord Malmesbury to Paris; in December an attempt of the French to make a descent upon Ireland was defeated by a storm which dispersed the invading fleet, having a force of 15,000 men on board, only two ships reaching the neighbourhood of Bantry Bay, which they left in a few days. The military events in which the British arms were concerned in 1797 were—the defeat of the Spanish fleet off Cape St. Vincent by Sir John Jervis, 14th of February; the capture from the Spaniards of Trinidad, Porto Rico, and Teneriffe; and the great victory obtained by Lord Duncan over the Dutch fleet off Camperdown, 11th of October. Peace with France having been made by Austria in April, another attempt at negotiation was made by the English government in the course of the following summer, Lord Malmesbury having been sent to meet the French plenipotentiaries at Lisle, but it ended in nothing. This was also the year of the suspension of cash-payments by the Bank of England, on the 27th of February, and of the mutiny in the fleet at Spithead in April, and at the Nore in June. The great domestic event of 1798 was the rebellion in Ireland, organised by the society of United Irishmen, which broke out in the end of May, and was not finally suppressed till the end of September. A small French force landed at Killala on the 22nd of August, and penetrated a considerable way into Connaught, but surrendered after a sharp contest to a detachment of the army of Lord Cornwallis, on the 11th of September. On the 1st of August this year Nelson gained his great victory of the Nile. In 1799 a new confederacy having been formed against France, to which Austria, Russia, Naples, and Turkey were parties, an English army was sent to the Netherlands under the command of the Duke of York, but it was soon compelled to evacuate the country. On the 4th of May, Tippoo Saib, the sultan of Mysore, who had entered into alliance with the French, was defeated and killed, and his capital of Seringapatam taken by Sir David Baird, on which the greater part of his dominions was added to the English territory. In August Surinam was taken from the Dutch, whose ships of war also in the course of this year almost all fell into the hands of the English. Minorca and Malta were taken by the English in the course of the year 1800.

Notwithstanding these and other partial successes, however, the heavy pecuniary exactions of the war, together with its evident failure in so far as respected an advance towards the attainment of any intelligible ultimate object, and the steady progress of the French arms in the subjugation of the continent, had now wearied and worn out the enthusiasm even of the greater number of those who had been originally its most ardent supporters. By a considerable part of the nation the contest had come to be regarded with feelings of the bitterest aversion. The inflamed temper of the populace, excited in part by the notion which very generally possessed them, that the real object of the war in which the country was engaged was the repression of democracy and liberty both at home and abroad, had, among other excesses, led to an attack upon the king by the mob as he passed through the park in going to and returning from the House of Lords at the opening of the session of parliament on the 29th of October 1795. The feelings however which vented themselves in this manner were never participated in by any considerable portion of the community; the sentiment of the great majority of all classes of the nation was certainly, throughout the reign, one of kindness and respect towards his majesty, with which, in most cases, even strong political dissent from the general course of his government did not much interfere. The affection that was entertained for the king personally was remarkably shown by the numerous addresses of congratulation that were presented from all parts of the kingdom on his escape from the attempt of a maniac named Hatfield, by whom he was fired at with a pistol from the pit of Drury-Lane Theatre, on the 15th of May 1800. In the spring of 1801 his majesty had another slight attack of his mental malady.

The important measure of the union of Great Britain and Ireland was after many difficulties at last effected in 1800. This event led, in March 1801, to the resignation of Mr. Pitt, who now considered himself pledged to the removal of the Catholic disabilities, to which however the king firmly refused his assent. A new ministry was in consequence constructed, with the Right Hon. Henry Addington (afterwards Lord Sidmouth) at its head. Immediately before these events a rupture had taken place with Russia, and that power had united with Sweden and Denmark in the establishment of a new armed neutrality. The death of the Emperor Paul however soon led to a reconciliation between England and the three northern kingdoms. Meanwhile, on the 2nd of April, Copenhagen was bombarded, and the Danish fleet partly taken, partly destroyed, by Nelson. In the East also, this year, the victory of Alexandria was gained over the French, with the loss of the gallant Sir Ralph Abercromby, on the 21st of March; and on the 2nd of September, Alexandria surrendered to Lord Hutchinson, and the French were compelled to evacuate Egypt. In the beginning of October it was unexpectedly announced that

negotiations which had been for some time in progress had terminated in the signature of the preliminaries of a general peace. This news was received with universal satisfaction and rejoicing. The definitive treaty of peace was signed at Amiens on the 25th of March 1802.

Within a year however hostilities were renewed. We need only notice as the most remarkable occurrences in the course of this war, in so far as this country was concerned, the occupation of Hanover by the French, in 1803; the declaration of war by Spain, in December 1804; the threatened invasion by France, and Nelson's glorious victory of Trafalgar, in 1805; the unsuccessful attempt to negotiate a peace, the capture of the Cape of Good Hope by England, and Bonaparte's Berlin decree of 1806; the seizure of the Danish fleet and the capture and subsequent evacuation of Buenos Ayres, in 1806; the insurrection in Spain, the alliance entered into with that country, and the expulsion of the French from Portugal, in 1808; the long contest begun in that year, which eventually achieved the liberation of the peninsula; the war with America, in 1812; the treaty with Russia, in that year; the treaties with Sweden and Austria, and the expulsion of the French from Hanover, in 1813; the peace with Denmark, in January 1814; the surrender of Paris to the allies, in March; the abdication of Bonaparte and restoration of the Bourbons; the peace with America, signed at Ghent, in December; the return of Bonaparte from Elba, in March 1815; and finally, the victory of Waterloo, in June following, which put an end to the war.

Of the public events which occurred within the kingdom during this period the most remarkable were:—the return of the king's illness for a few weeks in February 1804; the restoration of Mr. Pitt to power, in May of that year; the death of Mr. Pitt the 23rd of January 1806; the accession of the ministry of Mr. Fox and Lord Grenville; the death of Mr. Fox, 13th of September; the dissolution of the Grenville administration, in March 1807, in consequence of the king refusing his assent to their proposed measures for the relief of the Roman Catholics; the formation of a new cabinet under the Duke of Portland and Mr. Perceval; the resignation of the command of the army by the Duke of York, in March 1809, in consequence of the result of an investigation on charges of corrupt practices (of which however it appeared that the profits were reaped, not by the duke, but by his mistress, the notorious Mrs. Clarke); the celebration, on the 25th of October that year, of the Jubilee, on the occurrence of the fiftieth anniversary of his majesty's accession; the commencement of the final insanity of the king, in the end of October 1810; the consequent appointment, by act of parliament, of the Prince of Wales as regent, in February 1811; the assassination of Mr. Perceval, May 11, 1812; and the appointment of the Earl of Liverpool as premier. The ministry of Lord Liverpool lasted during the remainder of the reign. The king continued in the same state of mental incapacity into which he had fallen, till his death at Windsor Castle on the night of Saturday, the 29th of January 1820, in the eighty-second year of his age, and the sixtieth of his reign. He had been entirely blind for some years before his death.

For an enumeration of the children of George III. and Queen Charlotte (who died at Kew, 17th of November 1818) we refer to any of the Almanacs or Peerages. They were fifteen in all, namely, nine sons (of whom two, George, his successor, and William, reigned as kings of England, and one, Ernest, as king of Hanover), and six daughters, one of whom, Mary, is still living (1856).

On the subject of the character, moral and intellectual, of George III. there is probably now not much difference of opinion. He had no pretensions to any superior penetration or vigour of understanding, but he possessed rather more than the ordinary endowment of practical tact and skill in the management both of affairs and of men. He was perfectly master of all the proprieties of his station, which never, at least on important occasions, lost any of its respectability or authority during his occupation of it. His firmness or tenacity of purpose was such as usually to defeat in the end any attempt that was made to thwart his wishes in the movements of domestic politics, and indeed it was generally believed that the royal spirit of determination or obstinacy had a considerable share in prolonging more than one of the great public contests in which the country was involved during this reign, after all reasonable hope of success had vanished. But it has generally been admitted that the persistency of George III., however mistaken or unfortunate, was for the most part conscientious—in other words, that he firmly believed himself to be in the right even in those cases in which he was possibly most in the wrong. The credit that was given to him upon this point operated with a powerfully favourable effect, not only upon the estimation in which he was personally held, but in obtaining support to the measures of his government. The decorum of his private conduct also was of much service to him, as well as probably efficacious in no slight degree in giving a higher tone to the public manners and in making the domestic virtues fashionable even in the circles where they are most apt to be treated with neglect. It ought not moreover to be omitted, that, with whatever narrowness of view consequent upon his training and his position George III. may be chargeable, he was—what many influential persons of his time were not—an avowed friend to the diffusion of education, and certainly was not afraid that his subjects would be made either more difficult to govern or worse in any other respect, by all classes and every individual of them being taught to read and to write.

It is scarcely necessary to observe that over all our Western world, and nowhere more than in England, the period forming the reign of George III. is perhaps to be placed above every other of the same length in modern history for the multitude and vastness both of the social changes and of the accessions to almost every department of human knowledge by which it has been signalised. It is worth remarking however that even the political confusion and universal wars of the latter half of the period did not prevent that space from being at least as productive of valuable inventions and discoveries, and as distinguished for the busy and successful cultivation of every branch of science and literature, as the quieter time that preceded.

Very great changes took place in the extent of the British dominions during the reign of George III. Ireland ceased to be a separate kingdom—Hanover was lost and recovered—Canada was added to our colonies—our other and much more important possessions on the North American continent were severed from us—a new empire, immense in its extent and population, was acquired in India. On the whole, notwithstanding the loss of the American colonies, the power and influence of the state were undoubtedly much greater at the close of the reign than they were at its commencement. Of the commerce and wealth of the country it would be more correct to say that they were multiplied during this period than simply that they were increased. No financial operations were ever effected or undertaken or dreamt of in any other time or country approaching to the gigantic magnitude of those accomplished by the British government in the closing years of the late war. The revenue raised by taxation at the beginning of the reign was under nine millions; it did not reach ten millions till the year 1773; in 1780 it had increased to somewhat above 12,000,000*l.*; in 1786 it was 15,000,000*l.*; in 1793, at the commencement of the war with France, it was 17,000,000. After this new taxes were imposed to a considerable amount, so that the entire revenue raised in 1800 exceeded 34,000,000*l.* From this date it continued to rise every year, till in 1815 it amounted to the immense sum of 72,210,512*l.* ('Official Tables of the Board of Trade,' part iii.) In the seven years from 1810 to 1816 inclusive, about 472,000,000*l.* were raised by taxes alone, being on an average above 67,000,000*l.* per annum. In 1819, the last year of the reign, the sum thus raised was still nearly 53,000,000*l.* The sums raised by loans were, to the end of the Seven Years' War in 1763, about 32,000,000*l.*; during the American War (1775-84) above 121,000,000*l.*; and during the last war with France (1793-1815) above 609,000,000*l.* In the year 1813, the total amount borrowed was 52,000,000*l.* funded, and above 55½ unfunded, making, with the produce of the taxes, the total payments into the Exchequer for that year 107,597,660*l.*, being at the enormous rate of above 2,000,000*l.* weekly. The national debt, which at the commencement of the reign was about 103,000,000*l.*, on which was paid an annual interest of not quite 4,000,000*l.*, had increased by the end of the reign to above 800,000,000*l.* of principal, bearing an interest of more than 30,000,000*l.*

The collection of the statutes passed in the reign of George III. is nearly four times as large as that of the whole mass of preceding English legislation from the Conquest. We can only here mention, as having most of a popular or historical interest, the Act of 1761, continuing the commissions of the judges notwithstanding any demise of the crown; the Royal Marriage Act, already noticed; the Grenville Act of 1770 (amended in 1788), for the settlement of disputed elections of members of the House of Commons; the act of 1782, disqualifying revenue officers from voting at elections, and government contractors from sitting in the house; the act of 1792 (commonly called Fox's Libel Law), declaring the right of juries to judge of the law as well as of the fact in cases of libel; the act of 1801, excluding clergymen from the house of Commons; the act of 1807, abolishing the slave trade; Sir Samuel Romilly's acts of 1811 and 1818, for the amelioration of the criminal law; the act of 1813, abolishing the penalties and incapacities to which Unitarians were formerly subjected; the act of 1819, abolishing the appeal of battle in cases of murder; the Foreign Enlistment Act, of the same year; and the acts of that year for the suppression of blasphemy and sedition, commonly called the Six Acts.

GEORGE (AUGUSTUS FREDERICK) IV., King of Great Britain, the eldest son of George III., was born on the 12th of August 1762, exactly forty-eight years (making allowance for the difference of style) after the accession of the house of Hanover. On the 17th he was created by letters patent Prince of Wales and Earl of Chester, and was baptised the next day. He was made a knight of the Garter December 26th, 1765, and a few months afterwards was appointed by a king's letter, addressed to the lord mayor, captain-general of the Honourable Artillery Company of the city of London. The Prince of Wales was educated along with his next brother, Prince Frederick, bishop of Osnaburg (afterwards Duke of York), in great privacy, and on a system of strict discipline. In April 1771, Lord Holderness was appointed governor, Mr. Smelt sub-governor, Dr. Markham, bishop of Chester (afterwards archbishop of York), preceptor, and Mr. (afterwards Dr.) Cyril Jackson sub-preceptor to the two princes. In 1776 however all these persons suddenly resigned their offices, for some cause which has never been satisfactorily explained. The common account is, that they found some political works which they considered objectionable put into the hands of the boys by the

directions of the king. Their successors were, for the first few days, Lord Bruce (immediately afterwards created earl of Aylesbury), and then the Duke of Montague, as governor; Lieutenant-Colonel Hotham as sub-governor; Dr. Hurd, bishop of Lichfield and Coventry (afterwards of Worcester), as preceptor; and the Rev. William Arnold as sub-preceptor.

The prince, notwithstanding murmurs and remonstrances, of which notice began to be taken in the public prints, was kept by his father in a state of unmitigated pupilage till he was nearly eighteen, his seclusion being divided between Buckingham House, Kew, and Windsor. It was not till the year 1780 that the prince began to appear much in public. From this time the life of the Prince of Wales for many years belongs for the most part to the *Chronique Scandaleuse*; but among the various persons of both sexes with whom he was connected, there are a few names that may be said to have already become historic, and that cannot altogether be passed over. The first of his many connections of a similar nature that became notorious was with Mrs. Mary Robinson, then an actress and the wife of an attorney. This lady (whose maiden name was Darby, whose early years were superintended by Mrs. Hannah More, who in the latter part of her life became the mistress of Colonel Tarleton, and died at Englefield Green, at the age of forty-two, in 1800, after having made herself well known by her novels and verses, as well as by her adventures) has told her own story in her own way in her 'Memoirs,' published after her death by her daughter. She was four years older than the prince, and already of damaged reputation, when she first caught his attention, in 1780, while acting Perdita in the 'Winter's Tale'; her influence lasted for not quite two years.

In December 1780, on the departure of the Bishop of Osnaburg for Germany, where he remained for seven years, a separate establishment on a small scale was formed for the prince; and having now become legally his own master, he was from this time much in the public eye. It was now that he entered upon his intimacy with Charles Fox, Sheridan, and other leaders of the Whig party, who happened accidentally to be also among the most distinguished patrons of the fashionable gaiety and licence of the day. One of the persons also with whom he formed the closest friendship about this time was the afterwards notorious Duke of Orleans, then styled the Duc de Chartres, who paid long visits to London in 1783 and several following years. With these associates the prince indulged without restraint his propensities for gambling, horseracing, and other kinds of extravagance and dissipation. He also adopted warmly and openly the politics of his Whig companions, and this at once placed him in direct opposition to his father's government. In April 1783 however his friends, under the name of the Coalition Ministry, forced themselves into power, and on the opening of parliament, on the 11th of November following, the Prince of Wales was introduced with great ceremony into the House of Lords as Duke of Cornwall, and took his place among the supporters of the new administration. They had, immediately after entering upon their places, laid before the king the claims of the prince for an augmented establishment and allowance. The ministers demanded 100,000*l.* a year, but the king would not consent to more than 50,000*l.*, with an allowance of 60,000*l.* as an outfit; the prince had besides about 14,000*l.* a year as duke of Cornwall. At the same time Carlton House was assigned to him as a residence. He stood by his friends on their expulsion a few months afterwards, and took an active part in the private movements that were entered into without success for their reinstatement. In 1786 the subject of the prince's pecuniary embarrassments, which had become extremely pressing, was first mentioned in the House of Commons by his friend Sheridan, and this led to a negotiation with the king, who however, after keeping expectation in suspense for some time, finally refused to sanction any measures of relief. In these circumstances the prince resolved to break up his establishment, and to limit his expenditure to 50,000*l.* a year, reserving the rest of his income for the payment of his debts. It was a short time before this that he had formed the most celebrated and lasting of his female attachments, that namely with Mrs. Fitzherbert, the daughter of a Roman Catholic gentleman of Shropshire, who had already been married first to Mr. Weld of Lulworth Castle, and secondly to Colonel Fitzherbert. The particulars of this marriage are sufficiently noticed under FITZHERBERT, MARIA, vol. ii. col. 920. By the terms of the Royal Marriage Act, the marriage of the prince with her, in whatever circumstances it took place, could not have been legal; but the point which occasioned the greatest public outcry was the fact of Mrs. Fitzherbert being a Roman Catholic, and as such, a person by marrying whom the prince by the Act of Settlement would have become incapacitated to inherit the crown. The state of the prince's pecuniary affairs was again brought before parliament in April 1787 by Alderman Newnham, one of the members for London; and on this occasion Mr. Fox came down to the house, and, on the express authority of the prince, characterised the supposed marriage with Mrs. Fitzherbert as a thing which not only had not happened, but which was even impossible to have happened. To a farther question he answered, "That he denied the calumny as false *in toto*, in every sense of fact as well as law;" he added that he spoke from direct authority. There can be no question that Mr. Fox had been made to believe that not even any ceremony of marriage had ever been performed. It is said that Mrs. Fitzherbert, upon learning what

had taken place, insisted, as the condition on which she would consent again to see the prince, that Mr. Fox's declaration should be as publicly and authoritatively retracted as it had been made; but it was found, after some attempts, that this could not be managed, and the lady soon afterwards yielded the point. She would never however speak to Mr. Fox again, who also complained strongly of the equivocal manner in which the prince expressed himself on the subject.

The further parliamentary agitation of the prince's pecuniary difficulties in 1787 was prevented by the king at last giving his consent to a grant of 160,000*l.* for the payment of his son's debts, and of 20,000*l.* for completing the repairs of Carlton House. Both these sums were greatly inadequate, but the arrangement afforded some relief for the moment, and enabled the prince to resume his former state and habits of life. The king's illness, in the close of the year 1788, and the proceedings that took place in regard to the proposed regency, have been noticed in the preceding article. Upon this occasion Mr. Fox asserted that the "exercise of the royal power was the clear right of the heir apparent, being of full age and capacity, during the king's incapacity;" but he afterwards admitted that "the heir apparent had no right to assume the executive power," and that, although the right was in the prince, "it was subject to the adjudication to him of its possession and exercise by the two houses." It may be doubted how far his position was strengthened or made more intelligible by this qualification. On the king's recovery both he and the queen showed themselves deeply offended with the conduct of the prince during his father's illness, although no distinct charge of undutifulness appears to have been alleged. A reconciliation however was effected about the beginning of the year 1790, through the interposition, it is understood, of Lord Thurlow, who had his own ends to serve. The king however would not consent to relieve the prince from his fast increasing embarrassments by another application to parliament except upon the one condition, that he would marry.

It was in the summer of 1791 that a transaction occurred which made a great noise at the time and long afterwards—the retirement of the prince from the turf, in consequence of the decision of the Jockey Club, that he must either take that step or dismiss a servant whom they held to be guilty of unfair management in relation to a particular race with one of his master's horses. The character of the tribunal is perhaps hardly such as to entitle us to draw from this decision any conclusion unfavourable to the prince, who is said to have had only a few hundred guineas depending on the race; and the circumstances seem to make it altogether improbable that either he or his servant was guilty of the foul play imputed. The prince stood by his servant, and settled on him an annuity of 200*l.* a year. He soon after sold off all his horses, to the number of 500, and again retrenching his expenses, and shutting up Carlton House, devoted the greater part of his income to the payment of his creditors. He now also publicly separated himself from Mr. Fox and his party by a speech in the House of Lords, the first he had ever delivered, on the 31st of May 1792, in which he declared his adherence to that section of his party which had gone over to the minister, in the division which had taken place on the subject of the French revolution. He afterwards took a formal leave of his old friends in a letter addressed to the Duke of Portland.

At length, in the summer of 1794, the prince, borne down by the heavy and rapidly augmenting load of his incumbrances, yielded to the demand so long urged by his father, and consented to marry. His unfortunate marriage with his cousin, Caroline Amelia Elizabeth, second daughter of the Duke of Brunswick and the Princess Augusta [GEORGE III.], took place on the 8th of April 1795. On this his income was raised to 115,000*l.* a year, 25,000*l.* being deducted from that sum for the payment of his debts, which according to the statement made to parliament amounted to about 650,000*l.* Disgust and alienation, as is well known, soon followed between the newly-married parties. So early as the beginning of June, the princess demanded the removal of Lady Jersey, who was one of her ladies in waiting; this the prince positively refused. The birth of a daughter, the late Princess Charlotte Augusta, on the 7th of January 1796, produced no return of affection; they continued to live for some months longer under the same roof, but without speaking to each other; a complete separation then took place, the princess retiring with her infant first to the village of Charlton, near Greenwich, and afterwards to Blackheath.

There are no events requiring much notice in the prince's history for some years after this. He frequently solicited his father to give him a military appointment, and a short time before the breaking out of the rebellion of 1798 he requested, it is said, to be allowed to undertake the chief government of Ireland; but all these petitions met with a determined refusal. About this time also he partially renewed his connection with Mr. Fox and his old friends—but it was now more an association of conviviality than of politics. The prince came nevertheless to be popularly considered as again the head or rallying-post of the Whig party; and on that and other accounts the estrangement between him and his father soon became as complete as before. His conduct to the Princess of Wales was viewed by the king with the deepest displeasure. In these circumstances it naturally happened that the Tories at this time clung to the princess, as their opponents did to her husband. Such was the political situation

of the parties when the first investigation into the conduct of the princess took place in the latter part of the year 1806, by a commission constituted by royal warrant, and consisting of the late lords Erskine, Grenville, Spencer, and Ellenborough, all then members of the cabinet. The allegations which led to this investigation proceeded from Sir John and Lady Douglas, who charged her royal highness not only with great impropriety and indecency of behaviour, but with having been delivered in 1802 of a male child, whom she had ever since brought up and retained near her under the name of William Austin. The report of the commissioners decidedly acquitted her royal highness on the latter and main charge; but added that there were other particulars deposed to by the witnesses examined respecting her conduct, "such as must, especially considering her exalted rank and station, necessarily give occasion to very unfavourable interpretations." The report however, and the answer of the princess (drawn up by her confidential advisers, Lord Eldon, Mr. Perceval, and Sir Thomas Plumer), together with other papers, having been afterwards submitted to the cabinet council (the Whigs were now out of office), it was declared by a minute dated 22nd of April 1807, to be the unanimous opinion of the members not only that the two main charges of pregnancy and delivery were completely disproved, but "that all other particulars of conduct brought in accusation against her royal highness, to which the character of criminality can be ascribed, are satisfactorily contradicted, or rest upon evidence undeserving of credit." With the exception of these decisions, all the proceedings in this affair were kept secret for some years; but the depositions of the witnesses and the other papers were at length surreptitiously published in 1813, in the well-known volume entitled 'The Book.' The history of the investigation into the conduct of the princess is in all its stages curiously illustrative of the movements and changes of position of the two great political parties; she was condemned or acquitted by the official reporters upon her conduct, according as the party to which her husband attached himself or their opponents happened to be in power, and her cause was taken up by either as the prince bestowed his favour upon the other.

On the king being taken ill in the end of 1810 the Prince of Wales was in the first instance appointed regent, with restricted powers, and for only one year. He entered upon his office by being sworn in before the privy council, 3rd of February 1811. The restrictions however were removed in the beginning of the following year. On thus becoming king in everything but in name, the prince disappointed the expectations of a great part of the public by retaining Mr. Perceval and the other ministers whom he had found in office on assuming the direction of the government. In fact no change in the policy of the government was produced by the regency: the prince threw off at once both his former associates and their principles. It is impossible, even if it were desirable, here to recount, except very cursorily, the succeeding course of events—respecting a large portion of which indeed, from their recentness, every reader must be supposed to possess a more complete knowledge than we can here attempt to supply. The course of public occurrences down to 1820 has been shortly noticed in the preceding article. In the beginning of 1813, the unhappy differences between the prince and his wife again became the subject of parliamentary and public discussion, in consequence of the publication by the princess in the newspapers of a letter which she had addressed to the prince, remonstrating against some steps that had been taken in relation to the Princess Charlotte. Upon that occasion the privy council, on the matter being submitted to them by the prince, reported that under all the circumstances of the case it was highly fit and proper "that the intercourse between her royal highness the Princess of Wales and her royal highness the Princess Charlotte should continue to be subject to regulation and restraint." Her former friends, the Tories, had now completely abandoned the cause of the Princess of Wales; the second name attached to this report was that of her recent confidential adviser, Lord Eldon. The publication of 'The Book' immediately followed. In 1814 the visit of the Emperor of Russia and King of Prussia to London, after the peace of Paris, led to renewed exposure and agitation, by the regent refusing to meet the princess at the drawing-room held by the queen for the reception of the foreign sovereigns. In resentment for her exclusion on this occasion, her royal highness left the country in the beginning of August, having first asked and obtained permission to make a tour on the Continent. It was understood that the intention now was to marry the Princess Charlotte to the Prince of Orange, eldest son of the King of the Netherlands; but on the 2nd of May 1816 she was married to Prince Leopold George Frederic of Saxe-Coburg, the present king of Belgium. Her melancholy death in childbirth followed on the 6th of November 1817, an event which placed the Duke of York next in succession to the crown. On the 5th of January, in this last-mentioned year, when the Prince Regent went to open parliament, he was shot at on his return through the park; two balls perforated the glass of the carriage. This occurrence and the excited state of the country led to the suspension of the Habeas Corpus Act, and to various other measures curtailing the public liberties. At this time, of seven sons of the king no one had any issue; in these circumstances, in order to provide for the continuance of the line of succession, the dukes of Clarence, of Kent, and of Cambridge were all married in the course of the year 1818.

The Duke of Cumberland had been married in 1815, but his son, the present King of Hanover, was not born till 1819.

The Prince Regent ascended the throne as George IV. on the death of his father, January 29, 1820. The first great public event of the new reign was the detection, on the 23rd of February, of the Cato-street plot to assassinate the ministers. Queen Caroline arrived in London on the 6th of June, and on the evening of the same day a message from the king was delivered to both houses of parliament, communicating papers respecting her alleged misconduct while abroad. On the 5th of July, a bill for divorcing and degrading her was introduced into the House of Lords by the premier, Lord Liverpool; the examination of witnesses in support and refutation of the charges on which this measure professed to be founded occupied some succeeding months. On the 6th of November, the second reading of the bill was carried by a majority of 123 to 95; on the 10th the third reading was only carried by 108 to 99; on this division, which destroyed all chance of the measure passing the Commons, it was abandoned. The queen however did not long survive her escape. The coronation of the king took place on the 19th of July 1821, when her majesty, having previously claimed it as her legal right to be crowned at the same time as queen consort, was repulsed in an attempt to obtain admission at the doors both of Westminster Hall and the Abbey. A few days after she was taken ill, and died at Brandenburgh House, Hammersmith, on the 7th of August. The king was at this time absent on a visit to Ireland; in the end of September he set out for Hanover, from which he did not return till the beginning of November; and in August following he went to Scotland. The suicide of the Marquis of Londonderry, secretary for foreign affairs, occurred while the king was absent on this last visit, and produced some change in the foreign policy of the administration. [CANNING, GEORGE.] The year 1822 was marked by severe agricultural distress and much discontent in England, and by more serious disturbances in Ireland.

Of the foreign transactions of the two or three following years, the most important were the recognition of the new states of South America, by sending consuls to them in October 1823; the contest with the Ashantees in 1824; and the commencement in April of that year of the Burmese war, which terminated in February 1826, in the treaty of Yandaboo, giving the British a considerable accession of territory on the eastern coast of the Bay of Bengal. Of domestic events during the same period, the most memorable is the great commercial crisis of December 1825. In December 1826, a body of troops was sent to Portugal to support the princess regent and the constitution established by Don Pedro against the hostile attempts of the Spanish government and of the absolutist faction organised by that power; the British force speedily put down the rebellion and restored tranquillity. The death of the Duke of York, January 22, 1827, transferred the character of heir presumptive to the Duke of Clarence; and the office of commander-in-chief, in which the Duke of York had been replaced soon after the commencement of the regency, to the Duke of Wellington. The termination of the political life of Lord Liverpool by a stroke of apoplexy followed on the 17th of February; the consequence of which was a complete change of ministry. In the beginning of April Mr. Canning was appointed first lord of the treasury, and soon after chancellor of the exchequer, on which the great body of the Whigs became the supporters of the new administration, while it was opposed by the Duke of Wellington, Lord Eldon, Mr. Peel, and others of the premier's former friends and colleagues. [CANNING, GEORGE.] The death of Mr. Canning however, on the 8th of August, made a new arrangement necessary. Viscount Goderich (now Earl of Ripon) then became premier, the Duke of Wellington being reappointed to the command of the forces, with a seat in the cabinet. Some time after this arrangement had been completed, the news arrived of the destruction of the Turkish fleet in the Bay of Navarino in Greece, by the attack of the combined squadrons of England, France, and Russia; an occurrence which in his majesty's speech, delivered at the opening of parliament, 29th of January 1828, was characterised as "a collision wholly unexpected," and an "untoward event." Meanwhile differences, of which various explanations were afterwards given, but which may be suspected to have had some relation to the affairs of Greece and Turkey, as well as to other matters both of foreign and domestic policy, had led to the resignation of Lord Goderich, and the appointment, on the 25th of January, of the Duke of Wellington as first lord of the treasury. The new ministry however was still composed in part of the friends of the late Mr. Canning, as well as of the members of the Tory party. This state of things lasted till the end of May, when a sudden misunderstanding or difference of opinion produced the resignation of Mr. Huskisson, which was immediately followed by that of Lord Dudley, Lord Palmerston, and Mr. Charles Grant. The ministry now came once more to be composed wholly of persons generally considered as belonging to the extreme, which was at the same time the main division of the Tory party. In particular, every member of the cabinet had hitherto been resolutely and steadily opposed to the concession of what was called the emancipation of the Roman Catholics, and indeed to every other proposed mitigation, whether in substance or even in form, of the rigid Protestantism of the state institutions. The most important among the other events of this year were, the return, on the 5th of July, of Mr. O'Connell, although a

Roman Catholic, as representative to the House of Commons for the county of Clare; the convention concluded 6th of August, between Ali Pasha, viceroy of Egypt, and Sir Edward Codrington, for the evacuation of the Morea by the Turkish troops, in conformity with which the whole Egyptian armament sailed for Alexandria on the 4th of October; the resignation by the Duke of Clarence, August 12, of the office of lord-high-admiral, to which he had been appointed by Mr. Canning; the recall, in December, of the Marquis of Anglesea from the government of Ireland; and the visit to this country, in the latter part of the year, of Donna Maria da Gloria, the young Queen of Portugal. On the 26th of February, this year, Lord John Russell had carried his resolution in the House of Commons for the repeal of the Test and Corporation Acts, against the opposition of ministers, by a majority of 237 to 193. A bill to effect the object of the resolution was afterwards introduced, and ministers refraining from joining the opposition to it in the House of Lords, it was passed into a law. This measure had till now been uniformly resisted by both sections of the administration under which it was thus conceded.

The great measure of domestic policy of the year 1829 was the concession at last of Roman Catholic emancipation. The consideration of the laws imposing disabilities on Roman Catholics, with a view to the practicability of their safe removal, was recommended in the king's speech, delivered at the opening of parliament on the 5th of February. The Relief Bill, and another abolishing the forty-shilling freeholders in Ireland, were brought into the House of Commons together by Mr. Secretary Peel, and read a first time on the 10th of March. The second reading of the Relief Bill was carried on the 18th by a majority of 353 to 173; on the third reading, 30th of March, the numbers were, ayes 320, noes 142; the second reading in the Lords was carried on the 4th of April by a majority of 217 to 112; and the third reading on the 10th by a majority of 213 to 104. Both bills received the royal assent on the 13th. Mr. O'Connell presented himself to take his seat for Clare on the 15th of May following; but after he had been heard at the bar, it was resolved by a majority of 190 to 116, that he should not be entitled to sit or vote without first taking the oath of supremacy; and on his refusal to take the said oath, a new writ was ordered to be issued for Clare.

In the early part of the year 1830 the king, who had for some time past lived in great seclusion, was attacked by an illness which soon assumed a serious appearance. After all prospect of his recovery had been for some time lost, he died at Windsor Castle on the morning of the 26th of June, in the sixty-eighth year of his age, and the eleventh of his reign. The same day proclamation was made of the accession of King William IV.

Many important alterations of the laws were made in the reign of George IV., besides the great national measures that have been already noticed. Both the laws relating to the punishment and those relating to the trial of offences were consolidated and amended by several acts introduced by Mr., afterwards Sir Robert, Peel, in which, and also in the general administration of the law, considerable progress was made in the application of the two great principles of diminishing the sanguinary character and increasing the certainty of punishments. Among the other legislative innovations of the reign may be enumerated the act of 1823, abolishing the ancient custom of burying persons who had committed *felo-de-se* in cross-roads, with a stake driven through their bodies; the Marriage Act Amendment Acts of 1822, 1823, and 1824; the act of 1824, for the restoration in blood of the representatives of the Scottish peers attained in 1715 and 1745; the act of the same year for ascertaining and establishing a uniformity of weights and measures; the act of the same year for the repeal of the combination laws; the act of 1827 to prevent arrests upon the *meane process* where the cause of action is under 20*l.*; the act of 1828 for rendering a written memorandum necessary to the validity of certain promises and engagements; the act of the same year for regulating the importation of corn; the Metropolis Police Act of 1829; the act of 1830 repealing the beer duties; and the act of the same year substituting the punishment of transportation for that of death, in cases of forgery. The mention of these measures is sufficient to indicate the progress of legislation during the reign.

GEORGE OF DENMARK, PRINCE, has a place in English history as the husband of one of our queens, and as having resided many years in England, and held a high public office. He was born April 21st 1653, and was the youngest son of Frederick III., king of Denmark, and the only brother of Frederick's successor, Christian V. His mother was Sophia Amelia, daughter of George, duke of Lüneburg. He made his first visit to England, after a short tour in France, in July 1669, when he was introduced at court, but remained only a few days. At the battle of Lunden, fought between the Danes and the Swedes, December 14th 1676, Prince George is stated to have distinguished himself by his bravery; and the rescue of the king his brother, after he had been taken prisoner by the enemy, is attributed mainly to him. The Princess Mary of York having been married to the Prince of Orange in 1677, the duke her father is said to have pressed his brother the king to leave to him the disposal of his other daughter Anne; but Charles thought it more advisable to comply in this instance with the national wish, and to have her also married to a Protestant. Anne's first suitor was the Prince of Hanover (afterwards her successor,

George I.), who came over to pay his addresses to her in 1681, but had scarcely landed when he was recalled by his father, who had negotiated a marriage for him with the daughter of the Duke of Zell. Some time afterwards overtures were made in behalf of his brother by the king of Denmark; and, Prince George having come over, he and Anne were married at St. James's on the evening of the 23th of July 1683.

On the accession of his father-in-law as James II., Prince George was made a privy councillor; and he was not understood ever to have made any opposition to the measures of the court till the last moment. The truth however appears to be that he was a mere cypher. Charles II. is said to have declared that he had tried him drunk and sober, and, he added with an oath, there was nothing in him. Nobody seems to have thought it worth while at this time even to try to make a tool of him. When the revolution came he is understood to have acted under the direction of his wife. It had been arranged some days before by her and Lord Churchill (afterwards the Duke of Marlborough), who was much in their confidence, that he should go over to the Prince of Orange, and Anne had transmitted to William an express promise to that effect. Prince George however continued with the king till the night of the 24th of November (1688), when, being at Andover, on his leaving table after having supped with James by his majesty's invitation, he rode off in company with the Duke of Ormond, Lord Drumlanrig, and Mr. Boyle, and joined William at Sherborne Castle; having left behind him a letter to his father-in-law, in which he attributed what he had done to zeal for the Protestant religion. "What!" said James, when he was told of his flight, "est-il possible gone too?" This, it seems, was the prince's common phrase on all occasions; and it had been in great requisition during some previous days, when reports of one desertion after another were constantly coming in.

After the acceptance of the crown by William, Prince George was naturalised by act of parliament, and immediately before the coronation of the new king and queen, in April 1689, he was created an English peer by the titles of Baron of Wokingham, Earl of Kendal, and Duke of Cumberland. He accompanied the king to Ireland in 1690, and was present at the battle of the Boyne. He used to attend and vote in the House of Lords both in the reign of William and in that of Anne, and he was even made occasionally to vote against the court in the former reign. His name stands affixed to the protest made against the rejection of the Place Bill of 1692, which had passed the Commons, and the defeat of which was only effected in the Upper House by the greatest exertions of the government. In other cases, again, they would get him to vote against his own convictions; as, for instance, in that of the bill against Occasional Conformity brought in by the Tory ministry in the first year of Queen Anne. Indeed he was only an occasional conformist himself, being in the habit of attending the Lutheran service in a chapel of his own, although he submitted to take the sacrament according to the forms of the Church of England when it became necessary to do so on his being appointed to office.

On the accession of Anne, while the actual command of the army was left in the hands of Marlborough, Prince George was declared generalissimo of all the queen's forces by sea and land; and he was also made lord high admiral, but with the novelty of a council to assist or act along with him. The queen also sent a message to the Commons, desiring them to make some suitable provision for her husband in case he should outlive her; and it was agreed that he should in that case have an income of 100,000*l.* Great opposition however was made in the Lords to a clause in the act exempting the prince from being comprehended in an incapacity created by the act settling the succession on the house of Hanover, which had provided that no foreigner, although naturalised, should hold any employment under the crown after that family came to the throne.

The prince's administration of the Admiralty was not glorious. In 1703, in 1704, and again in 1707, the loudest complaints were brought forward in parliament both against the proceedings of the lord high admiral's council and the conduct of affairs at sea. In fact as Marlborough, now a duke, governed the army in his own name, he governed the navy also through his brother, Admiral George Churchill, who was all along the prince's chief adviser. The prince is said to have sometimes complained of his insignificance or want of influence, but his dissatisfaction evaporated in the quietest way. Lord Dartmouth has some curious notices of him in his splenetic notes to Burnet's history. In one place he says:—"His behaviour at the revolution showed he could be made a tool of upon occasions, but King William treated him with the utmost contempt. When Queen Anne came to the throne she showed him little respect, but expected everybody else should give him more than was his due; but it was soon found out that his interposing was a prejudice in obtaining favours at court." Dartmouth goes on to state that all foreign princes had him in very low esteem, and he mentions some strange surmises made abroad as to the causes of his want of influence which were certainly altogether imaginary. "After thirty years living in England," this note concludes, "he died of eating and drinking, without any man's thinking himself obliged to him; but I have been told that he would sometimes do ill offices, though he never did a good one." (Burnet, 'Own Times,' i. 643. See also note on ii. 489.)

His death took place at Kensington Palace, October 28th, 1708.

His little capacity for business was made still less by his indolence or love of ease, which appears really to have been his strongest passion, or the most marked point of his character. Anne bore him no fewer than nineteen children, of whom only five lived to be baptised, and even of these two died on the day on which they were born. A daughter Mary, born June 2nd 1685, lived till February 8th 1687; another, Anne Sophia, born May 12th 1686, lived till February 2nd 1687; only a son, William, born July 24th 1689, and soon after created Duke of Gloucester (though the patent never passed the great seal), and in 1696 elected and installed a Knight of the Garter, outlived his infancy: he died July 30th 1700. He was a boy of great promise, and a copious account of him is given by Burnet, who was his preceptor.

GEORGE I. surnamed the Long-handed, grand-duke of Russia, was the son of Vladimir Monomachos, who married Gyda, daughter of Harold, the last Saxon king of England. After the death of her father at the battle of Hastings, in 1065, Gyda retired to Sweden, from which country she married Vladimir, about 1070. It is however impossible to ascertain whether George was the son of the English princess, as his father was married three times; but it is very probable, as George died in 1157, at an advanced age. He was of a very ambitious and grasping character, a circumstance from which he derived his surname, the Long-handed. Having received for his appanage the principality of Soozdal, situated in the north of Russia, he tried to establish himself on the grand-ducal throne of Kieff, which was possessed by his nephew Isiaslaf, and he succeeded in driving him from that principality (1149), but he was soon afterwards expelled himself by the Hungarians, who restored Isiaslaf. After many vicissitudes he attained his object, and became grand-duke of Kieff in 1155. He died two years afterwards. The reign of George is remarkable for the foundation of Moscow in a spot where, as the chroniclers relate, there lived a rich man named Koochko, of whose wife George became enamoured, and where, after causing the husband to be murdered, and having established for some time his residence there, he laid the foundation of a future city. George was very partial to the southern principalities of Russia, and being for a long time unable to possess any of them, he built several towns in his own dominions, to which he gave the names of those cities which were situated in the south; as for instance, Vladimir, Peryaslay, &c. His own dominions, inhabited originally by several Finnish tribes, living in an almost savage state, and being mostly idolaters, became civilised under this reign by the foundation of cities, churches, and monasteries.

George peopled the new towns with settlers of Slavonian and Finnish stock, whom he attracted by granting them privileges and several other advantages. This is the origin of the population of Grand Russia, generally known under the name of the Muscovite or Soozdalian, which being a mixture of Slavonians and Fins, exhibits a striking contrast in physical appearance, language, manners, and character to all the other Slavonian populations. This people ought never to be confounded with the real Russians, who inhabit the south-western provinces of the present Russian empire, as well as Galicia or Austrian Poland, and who, being of a pure Slavonic race, much more resemble in every respect the Poles, the Slovacks of Hungary, and other people of Slavonic origin, than the population of Grand Russia. After the reign of George I., the northern principalities acquired great importance, and his son Andrew increased his power and established his residence at the town of Vladimir, which was built by his father on the banks of the Klasma. Instead of aiming at the possession of Kieff, which conferred the empty title of the Grand-Duke of Russia, and which was captured and sacked by his son and a coalition of other princes (1159), he assumed that title in his own dominions. He strengthened his power by exiling all his brothers, who found refuge at the court of the Emperor Manuel Comnenus. Andrew was murdered by some conspirators in 1174. After two years of civil war, during which Michel, prince of Rezan, for a short time occupied the throne of Vladimir, Vsevolod, brother of Andrew and son of George I., obtained the grand-ducal dignity, which he preserved till his death in 1212.

GEORGE II., son of Vsevolod and grandson of George I., became grand-duke, not immediately after the death of his father, but after that of his competitor, the grand-duke Constantine, in 1219. His reign is marked by one of the most important events of the middle ages, which has produced the most decisive influence on the condition of Russia; we mean the invasion of the Moguls, the circumstances of which cannot be well understood without previously giving a short sketch of the state of Russia at the beginning of the 13th century.

The dominions of Vladimir the Great (who died in 1015) extended almost from the Baltic to the Black Sea, and from the frontiers of Hungary and Poland to the banks of the Volga, containing several tribes of Slavonians in the south and the west, and of Fins in the north and the east, who were forcibly united under the dominion of the Varangian or Norman dynasty of Ruric, but divided by that monarch between his twelve sons. From that time the different principalities, although occasionally united, continued to be subdivided by several successive sovereigns, so that at the period in question there was a great number of minor princes besides the two great principalities of Vladimir in the north and of Halich in the south. The

most important neighbours of Russia at that time were the nomadic nation of the Polovtze, called by the Byzantine writers Comans, who established themselves, about the middle of the 11th century, in the countries along the shores of the Black Sea from the banks of the Don to those of the Danube. By their inroads they became formidable to all their neighbours, but particularly to the Russian princes, by whom they were also often hired as auxiliary troops. In 1224 the Mogul expedition sent by Gengis Khan under his son Joodgee Khan, to extend his conquests in the west, attacked the Polovtze, whose chieftains, being defeated by the Moguls, fled to Russia, and entreated the Russian princes to assist them against an enemy, who, as they expressed it, "has taken our country to-day and will take yours to-morrow."

The Russian princes of the south, influenced by Motislaaf, duke of Halich, listened to the Polovtze, and having assembled an army of about 100,000 men, which was joined by great numbers of the Polovtze, marched against the Moguls.

The combined army was entirely defeated by the Moguls on the 31st of May 1224, on the banks of the river Kalka (now Kalmius) near the town of Mariopol. The Moguls after this victory extended their devastations as far as the banks of the Dnieper, but although no resistance was offered, they suddenly retired from the Dnieper into the deserts of Central Asia, and their invasion produced on the minds of the inhabitants the effects of a supernatural apparition. George II. had despatched an auxiliary force against the Moguls, but on their way they heard of the fate of the Russian expedition, and returned without meeting the invaders. The Russian princes soon forgot the invasion of the Moguls, and instead of thinking of the possibility of their return, abandoned themselves to their usual broils and internal as well as external feuds. Nothing was heard of the Moguls till 1237, when a report was spread that they had invaded the country of the Bulgarians, situated on the banks of the Volga, in the present government of Kasan. It was Batoo Khan, grandson of Gengis Khan, who was sent by his uncle Oktay with 300,000 men in order to extend his conquests to the west, and with instructions to give peace only to the conquered nations. The report was followed by the appearance of the invaders, who entered the principalities of Rezan, and summoned its sovereign to submit and to give up the tenth part of all his and his subjects' property. The Duke of Rezan, with some minor princes, resolving to oppose the Moguls, sent a message to the grand-duke George requesting his assistance; but George relying on his own forces refused to join them, and decided on awaiting the approach of the enemy in his own dominions. The Moguls took and destroyed Rezan after a brave defence, and massacred the inhabitants. Moscow, Kolonna, and many other cities shared the same fate. George entrusted the defence of his capital Vladimir to his sons, and retired to a fortified camp on the banks of the river Sit. The capital was taken by storm in February 1238, and everything was destroyed with fire and sword.

George II., whose two sons perished at Vladimir, awaited the enemies in his position, and though attacked by an overwhelming force fought bravely till he was killed, on the 4th of March 1238. The Moguls soon retired beyond the Volga, but in the next year they invaded Southern Russia, and having devastated a part of Hungary and Poland, penetrated as far as Liegnitz in Silesia, where they were repulsed in a battle with the Silesian dukes assisted by the Germans.

Batoo Khan returned to the banks of the Volga, where he summoned the Russian princes to pay him homage. Resistance was hopeless, and the grand-duke Yaroslaf, brother to George II., was the first who acknowledged the sovereignty of the Grand Khan. This is the beginning of the Mogul or Tartar domination in Russia, which lasted till about 1470.

GÉRARD, a celebrated translator of the middle ages, was born at Cremona, in Lombardy, in 1114. He early applied himself to philosophical studies, but as they were in a very low condition at that time amongst the Western Christians, he went to Spain, where learning was in a flourishing state amongst the Arabs. He there became thoroughly acquainted with the Arabic, and applied himself particularly to the translation of different works from that language into Latin. Gerard returned to his native town, where he died in 1187, at the age of seventy-three.

His principal translations which have reached us are—1. 'Theoria Planetarum.' 2. 'Allaken de Causis Crepusculorum.' 3. 'Geomantia Astronomica,' which was translated into French, and published under the title of 'Géomantie Astronomique,' in 1669 and 1682. 4. The Treatise on Medicine, of Avicenna, known by the name of the 'Canon.' 5. An Abridgment of the Medical Treatise of Rhazia, made by Abouli Ben David. 6. A Treatise on Medicine, by the same Rhazia. 7. 'Practica sive Brevarium Medicum' of Serapion. 8. The Book of Albengneft 'De Virtute Medicinarum et Ciborum.' 9. The 'Therapeutica' of Serapion. 10. The work of Jahak, 'De Definitionibus.' 11. 'Albucasis Methodus Medendi' (libri iii.). 12. 'Ars Parva' of Galen. 13. 'Commentaries on the Prognostics of Hippocrates.' All these works have been often printed.

GÉRARD, FRANÇOIS, BARON, one of the most distinguished painters of France, was born of a French father and Italian mother at Rome in 1770. He went early to Paris, and was first placed with

the sculptor Pajou, and finally with David, as he found painting better suited to his taste than sculpture. Gérard's first work of note was the 'Blind Belisarius' carrying his dying guide in his arms, painted in 1795; it is now in the Leuchtenberg Gallery at Munich, and is well known in prints. The next work which attracted notice was 'Psyche receiving the First Kiss from Cupid,' which, though extremely elaborate in execution, is an inferior work to the Belisarius: its delicate execution and academical drawing are nearly its only merits; the figures are motionless and lifeless. Cupid and Psyche look like tinted statues. These however were not the works of the mature artist, and they were followed by many admirable pictures in history, poetry, and portrait.

Some of Gérard's works are among the best and largest oil-paintings in existence. His entrance of Henry IV. into Paris (his masterpiece), painted in 1817, is, in more than one sense, a prodigious work: it is thirty French feet wide by fifteen high, and is almost one huge mass of life and character; the drawing is correct, vigorous, and varied, the colouring vivid, and it is a perfect school of costume for the period: it has been engraved by Toschi. This picture was painted for Louis XVIII. as a substitute for the 'Battle of Austerlitz,' painted by Gérard in 1810, and it procured him his title of Baron. The 'Battle of Austerlitz,' and the 'Coronation of Charles X.,' painted in 1827, are of the same vast proportions, as the 'Henry IV.,' but they are as inferior in execution as in subject. The 'Battle of Austerlitz' is, like many other of the large paintings of Napoleon's battles, little more than a display of military uniforms, though it is superior to the majority of the works of its class, and is equal to its subject: there is an engraving of it by Godefroy. The 'Henry IV.' and the 'Battle of Austerlitz' are at Versailles. The 'Coronation of Charles X.' was nearly destroyed in the revolution of 1830: but had it been entirely so, Gérard would probably have rather gained than lost in reputation; a robe picture is however a poor subject for any painter, but particularly for a great painter.

Of Gérard's small pictures, the best is perhaps 'Thetis Bearing the Armour of Achilles,' painted in 1822, and purchased by Prince Pozzo di Borgo, of which there is an engraving by Richomme. Two such works as the 'Henry IV.' and the 'Thetis' display rare powers for the same painter; and when we consider in addition that he was constantly engaged in portrait painting, in which he was unsurpassed in France in his own time, his title to the reputation of one of the great painters of recent times is manifest. A list of Gérard's portraits would almost amount to a list of the most illustrious personages of his age: Pierre Adam has etched a collection of eighty full-length portraits after him, seven inches and a half by five inches and a half, French—"Collection des Portraits Historiques de M. le Baron Gérard, premier peintre du Roi, gravés à l'eau-forte par M. Pierre Adam, précédée d'une Notice sur le Portrait Historique."

Gérard died January 11, 1837: he was a member of the Institute of France; a chevalier of the orders of St. Michel and the Légion d'Honneur; and member of the academies of Munich, Vienna, Berlin, Turin, Milan, and Rome.

There are many notices of Gérard in the French and German contemporary periodical press.

GÉRARD, JEAN-IGNACE-ISIDORE, but best known by his pseudonym, GRANDVILLE, one of the most eminent French caricaturists and designers of illustrations for books, was born at Nancy in 1803. He went to Paris young, an adventurer without money, and without friends; after awhile got admission to the atelier of Lecomte; managed to subsist by designing costumes, &c.; then advanced to making lithographic drawings; and continued improving his artistic powers and increasing his stores of observation till 1828, when he brought out his 'Metamorphoses du Jour,' by Grandville, a series of genial, piquant, and misanthropic crayon commentaries and criticisms on passing follies. These sketches had a prodigious success; Grandville's position was secured; and his pencil found abundant employment. The revolution of 1830 interfered for a time with his occupation; but when familiarity had brought its inseparable attendant, and the citizen king had come to be regarded by the citizens as a fair mark for the shafts of ridicule, Grandville made himself abundantly merry with the face and person of his sovereign and the royal advisers. Grandville was the very soul of 'La Caricature' as long as his pencil was permitted its free exercise; but on the promulgation of the law re-establishing the 'censure préalable' for designs, he abandoned politics, and threw all his energy into the making of drawings on wood for illustrated editions of classic authors, &c. Here he found a new field of triumph. His drawings were in their way almost the perfection of designs for engraving on wood. Not merely were they admirably conceived, and excellent as exemplifications of the passages they were intended to illustrate, but clear, correct, and vigorous in drawing, and brilliant in effect, they exhibited remarkable aptitude for that particular kind of engraving. As illustrations—full of fancy, ingenuity, quaint and genuine humour, and singularly suggestive,—they not only pleased the eye, but really added a new charm to the text. Among the works he illustrated were 'Gulliver's Travels,' 'Robinson Crusoe,' 'La Fontaine's Fables,' 'Beranger,' 'Jerome Paturot,' &c. Indefatigable in labour, he produced an almost infinite number of designs, and yet his active fancy showed no symptoms of exhaustion or even fatigue.

NOTO, DIV. VOL. III

But in the midst of his success, and in the very prime of his powers, his labours were brought to a sad and sudden termination. A man of domestic habits, and devotedly fond of his family, he had already had the misfortune to lose two children within a brief space of time by some of the ordinary maladies of childhood, when his third child in attempting to swallow a piece of meat got it so firmly fixed in its throat that all attempts to remove it proved unavailing. An incision was proposed as the only remaining though dangerous remedy; and while Grandville hesitated whether to consent to the operation, the child died in his arms. The shock was more than the unhappy father could sustain: his intellect gave way, and he survived his child but a short period. He died on the 17th of March 1847, aged forty-three.

GERARD, MAURICE-ETIENNE, COMTE, Marshal of France, was a native of Danvilliers, in the department of the Meuse, and was born April 4, 1773. He entered the army as a volunteer in 1791, and first saw fire under Jourdan, at Fleurus. He was already a captain in 1793, and Bernadotte, who was for many years his steadfast friend, appointed him soon after one of his aides-de-camp. After the treaty of Campo Formio he attended that general in his embassy to Vienna, and having saved his life during a riot, stimulated by the Austrian police, a lasting friendship was established between them. In 1799 he became a chef-d'escadron; and at the battle of Austerlitz (Dec. 2, 1805) his good conduct was so conspicuous that he received the Cross of the Legion of Honour on the field.

In 1806 Gérard was appointed to a brigade; and in 1809, at the battle of Wagram, Bernadotte gave him the command of the Saxon cavalry. He next went to serve in Spain, where he continued until October 1811, having been present at the battle of Albuera and several others.

Called to take part in the expedition against Russia in 1812, he contributed to the capture of Smolensko; and during the disastrous retreat which followed the burning of Moscow he was placed as second in command, under Marshal Ney, in the rear of the army. General Gérard distinguished himself by many proofs of valour at the passage of the Bérésina, where, with a few regiments greatly reduced in numbers, and consisting of half-famished men, he repeatedly sustained the shock of an entire army.—In 1813 he commanded one of the divisions of the 11th corps, under Marshal Macdonald: he was present at the battle of Bautzen, and his exertions, which were made on the impulse of the moment and without orders, accelerated the victory. He charged the enemy again without (or rather contrary to) orders at Goldsberg, and routed the Prussians with great slaughter, for which feat of arms the emperor gave him the command of the 11th corps. General Gérard was several times wounded, and very grievously at the battle of Leipzig, October 18, 1813. During the defence of the French territory in 1814, his zeal and intrepidity were frequently commended by Napoleon, especially at the victory of Montereau. After his return from Elba, in 1815, the emperor gave him the command of the army of the Moselle. On the 18th of June he was under the orders of Marshal Grouchy at Wavres, and when the report of the cannon was heard proceeding from the forest of Soignies, Gérard recommended an immediate advance of Grouchy's army of reserve in that direction.

On the return of Louis XVIII., Gérard retired to Belgium, where in 1816 he married the daughter of General Valence. The following year he was permitted to return to France. In 1830 Louis Philippe created him marshal of France, and appointed him minister of war, but his health compelled him to resign this office a few months later. In 1832 he was sent to besiege the fortress of Antwerp, defended by the Dutch general Chasse, when, having compelled the garrison to capitulate after a gallant defence, he returned to France and was made a peer. In 1834 the citizen king made him president of the council, or prime minister; but his declining health obliged him to resign this office on the 29th of October, after which he withdrew into private life. The provisional government of February 24, 1848, raised Marshal Gérard to the function of Grand Chancellor of the Legion of Honour. The marshal lived to see the restoration of the Bonaparte dynasty: he died at Paris, August 17, 1852, and was interred in the chapel of the Invalides.

GERARDE, JOHN, a famous herbalist of the time of Queen Elizabeth, was born at Nantwich in Cheshire, in the year 1545, and was educated as a surgeon. He removed to London, where he obtained the patronage of Lord Burghley, who was himself a lover of plants, and had the best collection in his garden of any nobleman in the kingdom. Gerarde had the superintendence of this fine garden, and retained his employment, as he tells us himself, for twenty years.

His London residence was in Holborn, where also he had a large physic-garden of his own, which was probably the first of its kind in England for the number and variety of its productions. It appears that in his younger days he had taken a voyage into the Baltic, since he mentions having seen the wild pines growing about Narva. He also says of the bay or laurel-tree ('Herbal,' pp. 1177, 1223), "I have not seen any one tree thereof growing in Denmark, Suecia, Poland, Livonia, or Russia, or in any of those wild countries where I have travelled."

Among the Lansdowne manuscripts in the British Museum (No. cvii. art. 92) is a letter of Gerarde's own drawing up for Lord Burghley to send to the University of Cambridge, recommending the establish-

ment of a physic garden there, to encourage "the facultie of simpling," Gerarde himself, whom Lord Burghley calls his servant, to be placed at the head of it: "So that if you intend a work of such emolument to yourselves and all young students, I shall be glad to have nominated and furnished you with so expert an herbalist; and yourselves, I trust, will think well of the motion and the man." As we read no more of it, it is probable that the scheme did not take effect.

The earliest publication of Gerarde was the catalogue of his own garden in Holborn: 'Catalogus Arborum, Fruticum, ac Plantarum, tam indigenarum quam exoticarum, in horto Johannis Gerardi, civis et chirurgi Londinensis, nascentium,' impensis J. Norton, 1596, 4to; reprinted in 4to, 1599. The first edition was dedicated to Lord Burghley; the second, after that nobleman's death, in very flattering terms, to Sir Walter Raleigh. A copy of the first edition (of extreme rarity) is preserved in the library of the British Museum, where it proved of great use to Mr. Aiton in preparing his 'Hortus Kewensis,' by enabling him to ascertain the time when many old plants were first cultivated.

In 1597 came out his 'Herbal, or General History of Plants,' printed by John Norton, in folio. The wood-cuts with which it was embellished were procured from Frankfurt, being the same blocks which had been used for the 'Kreuterbuch,' the German herbal of Tabernaemontanus, fol., Frankfurt-on-the-Maine, 1588. A second edition of Gerarde's 'Herbal' was published by Dr. Thomas Johnson, with emendations and corrections, fol., London, 1633; and this work continued to be one of the best sources of botanical intelligence, at least to the beginning of the 18th century. Gerarde died about the year 1607.

GERBERT, afterwards Pope Sylvester II., was born of poor parents at Aurillac in Auvergne. The time of his birth does not appear to be known; he died in 1003, at a very advanced age.

When young he entered the monastery of St. Gerault at Aurillac, and in that school commenced his studies. He afterwards visited Catalonia, where he learned mathematics from a Spanish bishop. About 968 he made a journey to Rome, a circumstance which gave him the opportunity of still further satisfying his thirst for knowledge. When Otho I. conferred on him the abbey of Bobbio, Gerbert's industry was not diminished by his promotion. He employed himself actively in teaching, and for several years, while he continued to reside at Bobbio, his fame attracted students from all quarters. Though he kept his abbey till his elevation to the pontifical chair, he gave up his residence in Italy on account of the uneasy life which he led there. From Italy he is said to have gone to Germany, where he became the tutor of young Otho, afterwards the second emperor of that name. From Germany he went to Rheims, and was made secretary to the Archbishop of Rheims, and master of the cathedral school. It is as a teacher that Gerbert established a reputation which few men since his time have acquired. Under his care the school of Rheims became one of the first in Europe, and its high character was maintained for nearly a century after his death. Among Gerbert's pupils we find the names of Nithard and Remi. In 992 Gerbert was promoted to the archbishopric of Rheims, from which however he was deposed a few years after his elevation. In 998 he received the archbishopric of Ravenna from the emperor Otho III.; and in 999 he was elected to the pontifical chair, which he filled for nearly five years, under the name of Sylvester II.

There is no doubt that Gerbert was a man of great ability and of very extensive acquirements for his age. He was also a most voluminous writer. The Benedictines of St. Maur ('Histoire Littéraire de la France,' tom. vi., 577, &c.) have devoted many pages to the consideration of his writings; but they have shown no great discrimination in their criticism. Geometry and astronomy were Gerbert's favourite pursuits; there is (or was) extant a manuscript treatise of his on sun-dials, and he also wrote on the astrolabe. He is said to have been acquainted with the Greek language. His letters, printed by Du Chesne, 1636, at the end of the second volume of his 'Historians of France,' throw some light on the ecclesiastical intrigues and political events of the time.

GERBERT, MARTIN, Prince-Abbot of St. Blaise, near Friburg, a learned and laborious writer on music, was born at Horb-sur-le-Necker, in 1722. Attached from his youth to church-music, he cultivated it assiduously, and having determined to write a history of it, he travelled during three years in France, Italy, and Germany, for the purpose of collecting materials in aid of his work, which was published in two quarto volumes, in 1774, and entitled 'De Cantu et Musica Sacra, à prima Ecclesiæ Ætate usque ad præsens Tempus.' He divides his history into three parts: the first finishes with the pontificate of St. Gregory; the second reaches the 15th century; and the third comes down to nearly the date of his own volumes. Though Gerbert directed his attention almost wholly to the music of the Roman Catholic Church, that is, to the Mass, he notices that of the Protestant establishments, and mentions in favourable terms Dr. Boyce's collection; but being one of those who disapprove the use of fugue, and all such laboured compositions, in ecclesiastical music, he censures the style while he admits the genius and skill of the English composers for the church. Gerbert published in 1784 another work, of equal importance with the former, in two volumes, under the title of 'Scriptores Ecclesiastici de Musica Sacra potissimum,' &c., which is a

collection of authors who have written on the subject of his favourite pursuit, from the 3rd century to the invention of printing. These, in number upwards of forty, are arranged chronologically. The work is extremely rare, but M. Forkel has given a useful analysis of it in his 'History of Music.' Gerbert died in 1792.

GERBIER D'OUVILLY, SIR BALTHASAR, a miniature painter and architect, was born at Antwerp about 1591. He came young to England, and was a retainer of the Duke of Buckingham's as early as 1618. He accompanied the duke to Spain, and painted a miniature of the Infanta for James I.; he was also employed in the treaty of marriage between Prince Charles and the Infanta Maria, though acting ostensibly only as a painter. He was employed also in Flanders after the accession of Charles I. to negotiate a private treaty with Spain, the same treaty in which Rubens was commissioned on the part of the Infanta, and about which he came to England. In 1628 he was knighted by Charles at Hampton Court: he was naturalised in 1641, and died in 1667 at Hempsted-Marshall, the seat of Lord Craven, which was built by Gerbier himself.

Gerbier was the author of several curious works, which are noticed at considerable length by Walpole. One, entitled 'Les Effets pernicious des meschants Favoris,' &c., he terms in his off-hand way—"an ignorant, servile rhapsody, containing little argument, many lies, and some curious facts, if the author is to be believed." No. 3884 of the Harleian manuscripts is entitled—"Sir Balthasar Gerbier, his admonitions and disputes with his three daughters, retired into the English nunnery at Paris, 1646." One of these daughters was maid of honour to the Princess Condé, and passed for her mistress when the princess made her escape from Chantilly, when the prince was imprisoned by Mazarin. There is a portrait of one of Gerbier's daughters, as a little girl, by Rubens, in the collection of Lord Spencer: there are also two pictures of Gerbier's family attributed to Vandyck; one belonging, in Walpole's time, to the Prince of Wales, the other to Mr. Sampson Gideon. Gerbier's portrait in one piece with Dobson the painter and Sir Charles Cotterel, painted by Dobson, is in Northumberland House; there is or was also in the same collection a miniature of the Duke of Buckingham on horseback, dated 1618, by Gerbier himself. In the Pepys Library at Cambridge there is a miscellaneous collection of robes, &c., emblazoned and illuminated by Gerbier. Gerbier appears to have been a courtier, and to have had a lively care for his own interests; and very much of a charlatan though a clever one. He kept in Charles's favour after the death of Buckingham, and he was in favour also with Charles II.: he returned with him to England and designed the triumphal arches which were erected for his reception. He was master of the ceremonies to Charles I., and in 1628 entertained him and the queen at his own house, at a supper, which must have cost at least 1000*l.*, says a contemporary. Gerbier states in one of his works that Charles had promised him the office of surveyor-general of works, after the death of Luigo Jones. From advertisements in the 'Parliamentary Intelligence,' he appears to have given lectures in several languages at his academy in Whitefriars on a great variety of subjects, with an entertainment of music in 1649-50.

(Walpole, *Anecdotes of Painting, &c.*)

GERMANICUS, CÆSAR, the eldest son of Drusus Nero Germanicus and of Antonia the younger, the nephew of Tiberius, and brother of Claudius, afterwards emperor, was born in the year B.C. 14. Augustus on adopting Tiberius made the latter adopt his nephew Germanicus. At the age of twenty Germanicus served with distinction in Dalmatia, and afterwards in Pannonia, and on his return obtained a triumph. He married Agrippina the elder, grand-daughter of Augustus, by whom he had nine children; among others Caius Caligula, and Agrippina the younger, mother of Nero. In A.D. 12 Germanicus was made consul, and soon after he was sent by Augustus to command the legions on the Rhine. On the news of the death of Augustus some of the legions on the lower Rhine mutinied, while Germanicus was absent collecting the revenue in Gaul; he hastened back to the camp, and found it a scene of tumult and confusion. The young soldiers demanded an increase of pay, the veterans their discharge. They had already driven the centurions out of the camp. Some offered their assistance to raise Germanicus to the supreme power, but he rejected their offers with horror, and left his judgment-seat heedless of the clamours and threats of the mutineers. Having retired with a few friends to his tent, after some consultation on the danger to the empire, if the hostile Germans should take advantage of the confusion caused by this secession of the troops, he determined upon exhibiting to the soldiers fictitious letters of Tiberius, which granted most of their demands, and the better to appease them he disbursed to them immediately a considerable sum by way of bounty. He found still greater difficulty in quelling a second mutiny, which broke out on the arrival of the legates from the senate, who brought to Germanicus his promotion to the rank of Proconsul. The soldiers suspecting that they came with orders for their punishment, the camp became again a scene of confusion. Germanicus ordered his wife Agrippina, with her son Caius Caligula, attended by other officers' wives and children, to leave the camp, as being no longer a place of safety for them. This sight affected and mortified the soldiers, who begged their commander to revoke the order, to punish the guilty, and to march against the enemy. They then began to inflict summary

execution on the ringleaders of the mutiny, without waiting for the order of their commander. A similar scene took place in the camp of two other legions, which were stationed in another part of the country under the orders of Cæcina. Availing himself of the present state of excitement of the soldiers, Germanicus crossed the Rhine, attacked the Marsi, the Bructeri, and other German tribes, and routed them with great slaughter. In the following year, taking advantage of a quarrel between Arminius, the conqueror of Varus, and Segestes, another German chief, he attacked Arminius, and penetrated to the spot where the legions of Varus had been cut to pieces. The bones of the Roman soldiers, which still lay on the ground, were collected and buried by their countrymen. Arminius however fought bravely, and was near defeating a division commanded by Cæcina. In the following campaign Germanicus embarked his troops on board a flotilla which he had constructed or collected for the purpose, and sailing from the island of the Batavi, he landed at the mouth of the Ems, from whence he marched towards the Visurgis, or Weser, where he found Arminius encamped. Two obstinate battles were fought in succession, in both of which Arminius was defeated. Germanicus raised a trophy with this inscription: 'The army of Tiberius Caesar, having conquered the nations between the Rhine and the Elbe, consecrates this monument to Mars, Jupiter, and Augustus.' After this victory he sent part of his legions by land to their winter-quarters on the Rhine, and with the rest embarked on the Ems, to return by sea; but being surprised by a dreadful storm, his vessels were dispersed, many were lost, and he himself was cast on the coast of the Chauci, whence he returned to the Rhine and placed the legions in winter-quarters. Meantime, Tiberius wrote repeatedly to his nephew, that he had earned enough

Coin of Germanicus.

British Museum. Actual size. Copper. Weight 171 grains.

of glory in Germany, and that he ought to return to Rome to enjoy the triumph which he had merited. Germanicus asked for another year to complete the subjugation of Germany, but Tiberius, who felt jealous of the glory of his nephew and of his popularity with the troops, remained inflexible, and Germanicus was obliged to return to Rome, where he triumphed in the following year A.D. 17. The year after, he was consul for the second time with Tiberius himself, and was sent to the East, where serious disturbances had broken out, with most extensive powers. But Tiberius took care to have a watch over him by placing in the government of Syria Cnæus Piso, a violent and ambitious man, who seems to have been well qualified for his mission, as he annoyed Germanicus in every possible way, and his wife Plancina seconded him in his purpose. The frank and open nature of Germanicus was not a match for the wily intrigues of his enemies. After making peace with Artabanus, king of the Parthians, and calming other disturbances in the East, Germanicus fell ill at Antioch, and after lingering some time he died, plainly expressing to his wife and friends around him his conviction that he was the victim of the treason of Piso and Plancina; whether he meant through poison, or through their annoyances, has been a subject of doubt. His wife Agrippina, with her son Caius and her other children, returned to Rome with the ashes of her husband. [AGRIFFINA THE ELDER.]

Germanicus was generally and deeply regretted. Like his father Drusus he was while living an object of hope to the Romans. He died A.D. 19, in the thirty-fourth year of his age. He is praised for his sincerity, his kind nature, his disinterestedness, and his love of information, which he exhibited in his travels in Greece and Egypt.

(Tacitus, *Annals*, lib. i. ii.; Dion Cassius, lib. lvii.)

GERSON, JOHN CHARLIER DE, chancellor of the University of Paris, surnamed the Most Christian Doctor, was born in 1363, at the village of Gerson, in the diocese of Rheims, whence he took his name. He began his studies at Paris, where, having risen by degrees, he attained the place of chancellor of the university, and became canon of Notre Dame. France was during that period disturbed by civil wars, and all Europe was agitated by the religious contest between the popes and anti-popes. Gerson distinguished himself in his own country by loudly inveighing against the assassination of the Duke of Orleans, which exposed him to a severe persecution from the Duke of Burgundy's party. His house was pillaged by an infuriated mob, and he escaped with his life only by concealing himself for some time in the vaults of the church of Notre Dame. His courage was not subdued by this occurrence, and as soon as he resumed his functions he vigorously attacked, before the university and the clergy, the doctrines of Jean Petit, a doctor of the University of Paris, who defended the murder of the Duke of Orleans as a legitimate act in a

public oration delivered on the 8th of March 1403, where he maintained that it was permitted, and was even praiseworthy, to kill a tyrant; and that it was allowable to employ for the attainment of that object all possible means. Gerson zealously advocated the convocation of the council of Pisa by his memoir 'De Unitate Ecclesie.' At that council he distinguished himself by great firmness united with much prudence, when the two contending popes, Gregorius XII. and Benedict XIII., were deposed, and Alexander V. elected. It was on this occasion that he published his celebrated treatise, 'De Auferibilitate Papa.' He appeared at the council of Constance as the ambassador of Charles IV. king of France, and the representative of the French Church and of the University of Paris. In that assembly he exercised an immense influence, particularly in the deposition of Pope John XXIII., who had succeeded Alexander V. In all his speeches and in all his writings he maintained that the church had the right to make reforms, not only with relation to her members, but even to her chief; that it had the right of convoking a council without the consent of the pope, whenever he refused to give it. He also maintained that it was necessary to convoke councils general as well as particular, to abolish the annates, and to extirpate simony, which was then very common, &c. By his influence he established as a basis of all the decrees of council the doctrine of the supremacy of the church over the pope in matters of faith and discipline. Gerson disputed at the Council of Constance with Huss, against whom he declared himself with violence. Though Gerson would have added to his reputation by preventing the martyrdom of the Bohemian reformers, it must be admitted that he was in many respects superior to the superstitions of his time. He strongly condemned in his treatise 'Contra Sectam Flagellatorum' the self-torments inflicted by those fanatics, which were zealously promoted by St. Vincent Ferrerius, to whom Gerson addressed his friendly remonstrances on that subject. In his work entitled 'De Probatione Spirituum,' he established the rules by which a true may be distinguished from a false revelation; and he is far from being favourable to the revelations of St. Bridget, which made a great noise in his time.

The persecution of Gerson by the Duke of Burgundy's party was so violent, that he durst not return to France, but was obliged to take refuge in Germany. He went from Constance, in the disguise of a pilgrim, to Bavaria, where he wrote his work 'De Consolatione Theologiae,' on the model of the celebrated work of Boethius, 'De Consolatione Philosophiae.' It is written both in prose and verse, and passed through many editions. The 'Imitation of Jesus Christ,' generally ascribed to Thomas à Kempis, appeared for the first time appended to a manuscript of Gerson's above-mentioned work, 'De Consolatione Theologiae,' dated 1421, whence arose a supposition which has found many supporters, that he was the real author of that celebrated work. Gerson remained several years in Germany, after which he returned to France, and fixed his residence in a convent of the Celestine monks at Lyon, of which his brother was the superior, and where he died in 1429.

GERVASE OF CANTERBURY, an historian of the 13th century, was a monk of Christ Church in that city. His 'Chronicle of the Kings of England,' from 1122 to 1200, and a 'History of the Archbishops of Canterbury,' from St. Augustine to Archbishop Hubert, who died in 1205, are his principal works. Both are published by Roger Twyden, in the 'Decem Scriptores.' Bishop Nicolson, in his 'English Historical Library,' 4to, London, 1776, p. 45, ascribes a more extended history to him, of an entire copy of which he thinks Leland had the perusal. Manuscripts of Gervase of Canterbury are preserved in the Cottonian Collection, Vespas. B. xix., and in the library of Corpus Christi College, Cambridge, cod. 438, both of good age.

GERVASE OF TILBURY, also an historian of the 13th century, received his name from Tilbury in Essex, where he was born. Several modern writers state him to have been the nephew of King Henry II., but it is more certain that through the interest of the Emperor Otho IV. he was made marshal of the kingdom of Arles in France. He appears to have written a Commentary upon Geoffrey of Monmouth's 'History of Britain;' a 'History of the Holy Land;' a treatise, entitled 'Origines Burgundionum;' and a History of the Kings of England and France, comprised in a work entitled 'Otia Imperialia,' a fragment of which is printed with his name in Duchesne's 'Historia Francorum Scriptores,' tom. iii., p. 363. Manuscripts of the 'Otia Imperialia' are preserved in the Cottonian Collection, Vesp., E. i., and in the Library of Corpus Christi College, Cambridge, cod. 414; they comprise the treatises entitled 'Mundi Descriptio,' and 'De Mirabilibus Mundi,' ascribed to him as separate works. Nicolson, 'Engl. Hist. Lib.' edit. 1776, pp. 50, 151, ascribes to him the 'Black-Book of the Exchequer;' but Madox, who published a very correct edition of that work, gives it to Richard Nelson, bishop of London.

GESENIUS, FRIEDRICH-HEINRICH-WILHELM, one of the most distinguished Orientalists of modern times, was born at Nordhausen, on the 3rd of February 1780. He was educated in the gymnasium of his native place, and afterwards in the universities of Helmstedt and Göttingen. After the completion of his studies he was for a short time employed as teacher at the Pædagogium of Helmstedt; in 1806 he received the post of repetitor in the theological faculty of the University of Göttingen. In 1809 Gesenius, on the recommendation

of the celebrated historian Johannes von Müller, was appointed professor of ancient literature in the gymnasium of Heiligenstadt. This office however was of short duration, for in the year following he accepted the appointment of professor extraordinary of theology in the University of Halle, where in 1811 he was raised to the rank of ordinary professor. During the war of the Liberation the university was closed, and when it was opened again in 1814 Gesenius resumed his former office, and was created Doctor of Divinity. During the summer of 1820 he made a journey to Paris and Oxford, where he collected materials for his great lexicographical works on the Semitic languages. He died on the 23rd of October 1842. Gesenius was unquestionably the greatest scholar of modern times in his particular department of Oriental literature, and the light he has thrown on the Semitic languages, and especially on the Hebrew, has made a new era in this branch of philology. As a theologian he belonged at first to the Rationalistic party, but after the appearance of Strauss's 'Life of Jesus' he joined the philosophical and critical school, in consequence of which he was very often severely attacked by the orthodox party.

His works on the Hebrew language enjoy a universal reputation, and some of them are translated into most European languages. The most important among them are:—1. 'Lexicon Manuale Hebraicum et Chaldaicum in Veteris Testamenti Libros,' 2 vols. 8vo, Leipzig, 1833. This work was originally written in German, and went through two editions; the third was made in Latin, and a fourth in German appeared in 1834. 2. 'Hebräisches Elementarbuch,' 2 vols. 8vo. The first volume of this work is a Hebrew Grammar, of which the twelfth edition appeared at Leipzig in 1839; the second is a Hebrew Delectus, and the seventh or last edition was edited after the author's death by De Wette, Leipzig, 1841. 3. 'Kritische Geschichte der Hebräischen Sprache und Schrift,' Leipzig, 1815, 8vo, is intended as an introduction to the study of Hebrew; a second edition appeared in 1827. 4. 'De Pentateuchi Samaritani Origine, Indole et Auctoritate,' Halle, 1815. 5. 'Ausführliches grammatisch-kritisches Lehrgebäude der Hebräischen Sprache, mit durchgängiger Vergleichung der verwandten Dialecte,' Leipzig, 1817, 8vo. 6. 'A German translation of the Prophet Isaiah, with a philological, critical, and historical commentary,' Leipzig, 1820-21, 3 vols. 8vo: of the first volume a second edition appeared in 1829. 7. 'Scripturæ Phœnicæ Monumenta quotquot supersunt edita et inedita ad Autographorum optimatorumque Exploratorum Fidem edidit, Commentariis illustravit,' &c., parts i. to iii., with plates, Leipzig, 1837, 4to. 8. 'Versuch über die Malesische Sprache, zur Beurtheilung der neulich wiederholten Behauptung, dass sie ein Ueberrest des alt-Punischen sei,' Leipzig, 1810, 8vo. 9. 'Thesaurus philologicus criticus Linguae Hebraicæ et Chaldaicæ Veteris Testamenti,' vol. i. consisting of two parts, and the second of one, Leipzig, 1829-42, 4to. A few copies of this work, which is in reality an enlargement of the one mentioned above under No. 1, were printed in folio. Gesenius also contributed a great number of articles on Hebrew and other Oriental subjects to Ersch and Gruber's great 'Encyclopædia.' Biblical geography is especially indebted to him for the notes which he added to the German translation of Burckhardt's 'Travels in Syria and Palestine,' Weimar, 1823, 2 vols. 8vo.

(*Neuer Nekrolog der Deutschen für 1842; Gesenius, Eine Erinnerung für seine Freunde*, Berlin, 1842, 8vo.)

GESNER, CONRAD, an eminent scholar and naturalist, who was a striking example of the truth of the remark, that those who have most to do, and are willing to work, find most time. Beginning his career under all the disadvantages attendant on poverty, sickness, and domestic calamity, and cut off at the early age of forty-eight, Gesner left behind him, notwithstanding the cares of the medical profession which he actively and successfully exercised, such an amount of literary labour as would have won for him the title of one of the most learned and industrious of men, if his useful life had been occupied solely in its production. Zürich was his birth-place, where on the 26th of March 1516 he came into the world to add to the difficulties of his parents, who were struggling to support a large family. His father appears to have been a skinner or worker in hides, and his mother's name was Friccius, or Frick. To his maternal uncle, John Friccius, he seems to have been indebted for kind assistance and tuition; but this good relation died—his father was killed at the battle of Zug (1531), when the son was only fifteen—and the poor lad, after struggling with a dropsical disorder, set out for Strasbourg to seek his fortune. He was among strangers, but his spirit bore him up; and in the service of the well-known Lutheran, Wolfgang Fabricius Capito, he resumed the study of the Hebrew language, which he had begun to learn at Zürich. On his return to Switzerland the academy of Zürich allowed him a pension, which enabled him to travel in France. At Bourges, where he stayed a year, Greek and Latin principally engaged his attention; and to assist in defraying his expenses, he taught in school. From Bourges he proceeded to Paris, where he does not appear to have done much; and after a short stay at Strasbourg, whither he was led by the hope of employment, the University of Zürich sent for him, and he became a teacher there. He now married, at the age of twenty, not with the approbation of his friends, who saw that his income could not be equal to his wants.

The church was his destination, but the strong impulse of his mind stimulated him to the study of physic, to which he determined to apply himself with a professional view; and, resigning his situation at

Zürich, he went to Basel as a medical student, his pension being still continued. Here he seems to have commenced his labours for the public in superintending the edition of the Greek Dictionary of Phavorinus; and he accepted the Greek professorship in the newly-founded university of Lausanne. He afterwards passed a year at Montpellier, where he formed an intimate acquaintance with Laurent Joubert, the celebrated physician, and Rondeletius, the great naturalist. His emoluments were now not only adequate to his expenses, but moreover enabled him to prosecute the medical and botanical pursuits so dear to him; and at Basel in 1541, or as others say in 1540, he took his degree of Doctor in Medicine. Zürich was the field of his practice, which enabled him to cultivate his taste for natural history. He founded and supported a botanic garden, collected a fine library, made numerous drawings, and gave constant employment to a painter and to an engraver in wood. In the midst of his laborious profession, the astonishing industry of the man found time for the principal works on which his fame rests. He lived honoured and respected for his talents and benevolence in his native town, till an attack of the pestilence which he had successfully combated in the cases of others, and to which his professional activity most probably exposed him, carried him off in his forty-ninth year, on the 13th of December 1565. His remains rest in the cloister of the great church at Zürich, near those of his friend Frisius. He was bewailed in abundance of Latin and in some Greek verses. Theodore Beza was among the most elegant of these tributaries; and his funeral oration was pronounced by Josias Simler, who wrote his life (1566, 4to), of which Gesner himself had given some details in his 'Bibliotheca;' but perhaps the most complete biography is that of Schmiedel, prefixed to Gesner's botanical works. He must have been much lamented by his contemporaries; for, in addition to his other amiable qualities, he appears to have been a general peacemaker—his calm, candid, and equable temper enabling him to soothe the angry feelings of authors under their real or imagined wrongs; and he was always ready to lay aside his own labours to assist others. He devoted his time to the supervision and publication of Moiban's work on Dioscorides for the emolument of his deceased friend's family; and the 'Historia Plantarum' of Valerius Cordus was after the death of the author edited by Gesner; as well as the 'Lexicon Rei Herbariæ Trilingue' of David Kyber, who died of the plague at Strasbourg in 1553.

In the year 1545 Gesner journeyed to Venice and Augsburg, where he made the acquaintance of many learned and meritorious men; and this leads us to the literary works which have justly rendered Gesner's name famous, for then it was he commenced the publication of his 'Bibliotheca Universalis,' a grand design, and the first and hitherto the most complete bibliographical work upon a large scale. Gesner's 'Bibliotheca' was a catalogue of Greek, Latin, and Hebrew works, with criticisms, and frequently specimens of the author quoted, and appeared in 1 vol. folio (1545, Zürich). The volume 'Pandectarum, sive Partitionum Universalium' (1548) may be considered as the second of the 'Bibliotheca.' Gesner never published the book relating to medical works, because he did not consider it to be sufficiently perfect. An abridgment of the 'Bibliotheca' by Lycopæthes, and completed by Simler and J. J. Fries, was published in 1583 (folio). Haller's 'Bibliotheca Botanica,' and 'Bibliotheca Anatomica,' were probably imagined from Gesner's work.

But the 'Historia Animalium' must be considered the great work of Gesner. These well-filled folio volumes appeared at Zürich in the following order:—Viviparous Quadrupeds (1551); Oviparous Quadrupeds (1554); Birds (1555); Fishes and other Aquatic Animals (1556)—this volume contains the labours of his contemporaries and friends Belon and Rondelet, with some additions by himself; Serpents (posthumous and published by James Carron, a Frankfurt physician, 1587)—this is more rare than the other volumes, and there is usually added a treatise on the Scorpion, posthumous also, and published in the last-mentioned year at Zürich by Caspar Wolf. There is also an edition in German. Of the Insecta, some inedited figures of butterflies are all that are known; but that Gesner had not neglected this class of animals is manifest from Mouffet's 'Insectorum sive Minimorum Animalium Theatrum; olim ab Edoardo Wottono, Conrado Gesnero, Thomae Pennio, inchoatum' (fol. Lond., 1634), which is partly made up from Gesner's fragments. The work does not comprise the Mollusks and Testaceans as a class.

All agree that this compilation, having for its object nothing less than a general history of animated nature, concentrating and critically revising all that had been done before the time of the author, enriched with his own knowledge, and illustrated by many incidental remarks in the departments of botany and medicine, might have been considered as evidence of most persevering and praiseworthy industry, if it had been the production of a recluse whose long life had been entirely spent in the task; whereas it was only one of many books written by a man who gained his subsistence by perhaps the most harassing and time-consuming of all professions, and who died in harness when he was not forty-nine years old.

Gesner, in this work, which he carried out to completion as far as the Vertebrata are concerned, followed the method of Aristotle; and though there is not any establishment of genera, it may be considered as the principal source of more modern zoology, from which succeeding writers drew largely, and of which their publications mainly

consisted. Thus it was copied in many parts, almost literally, by Aldrovandus; and Jonston's 'Historia Naturalis' is little more than an abridgment of it.

Gesner's 'Historia' were compressed and appeared under the titles of 'Icones Animalium,' &c. This book is much more common than the original.

Passing by the various learned treatises that flowed from Gesner's prolific pen, we must notice the complete translation of the works of Ælian (1556). Gesner's notes also appear in the edition of Gronovius (London, 1744), &c.

This extraordinary man is next presented to us in another point of view; for he is said to have designed and painted more than 1500 plants. A large share of the 1500 figures prepared by Gesner for his 'History of Plants,' and left at his death, passed into the 'Epitome Matthioli,' published by Camerarius in 1586; and in the same year, as also in a second edition in 1590, they were used as illustrations of an abridged translation of Matthiolus, bearing the name of the 'German Herbal.' The same blocks were used by Uffenbach (1609) for the 'Herbal of Castor Durantes,' printed at Frankfurt, and comprising 948 of Gesner's. After the death of Camerarius, Goerlin, a bookseller of Ulm, purchased the blocks, and they embellished the 'Parnassus Medicinalis Illustratus' of Becker (Ulm, 1633). In 1678 they found a place in Bernard Verzacha's 'German Herbal;' and they appeared again in the 'Theatrum Botanicum' (Basel, 1696), and in an edition of that work so late as 1744.

Besides the above, Gesner is said to have left five volumes, consisting entirely of figures, which, together with his botanical works in manuscript, became at last the property of Trew of Nürnberg, and were published under the care of Dr. Schmiedel, physician to the margrave of Anspach (Nürnberg, 2 vols. folio, 1754-70).

In closing our notice of this amiable, learned, and industrious man, it may not be uninteresting to state that, according to Haller, it is probable that Conrad Gesner was the first short-sighted person who aided the defect of his eye with concave glasses. Plumier dedicated to him a genus of plants of the family 'Campanulaceæ,' under the name of 'Gesnera.'

GESNER, JOHN MATTHIAS, born near Anspach in 1691, became rector of the school of Weimar, and was afterwards professor of eloquence and poetry at Göttingen. He distinguished himself as a classical scholar. His principal works are:—1, 'Novus lingua et eruditionis Romanæ Thesaurus,' 4 vols. fol., Leipzig, 1749, a useful compilation; 2, 'Prima linea Isagoges in Eruditionem universalem, nominatim Philologiam, Historiam et Philosophiam, in usum prælectionum ductæ,' 2 vols. 8vo, Leipzig, 1775; 3, 'Biographia Academica Göttingensis,' 3 vols. 8vo, 1769; 4, A good and handsome edition of the ancient Roman writers on agriculture: 'Scriptores Rei Rusticæ veteres Latini, Cato, Varro, Columella, Palladius, quibus accedit Vegetius de Mulo-Medicina, et Gargilii Martialis Fragmentum,' 2 vols. 4to, Leipzig, 1735, with Notes variorum, and an Index, or Lexicon Rusticum. He published also editions of Horace, Quintilian, Claudian, &c., and of Philopatra's 'Dialogus Lucianæus,' with a dissertation on the authority and age of the same. Gesner died at Göttingen in 1761.

GESSNER, SOLOMON, born at Zürich in 1730, and a painter by profession, distinguished himself both as a painter and a poet. His first publication was some pastoral poems, 'Idyllen,' which had a considerable success at the time, but they are rather tame, and have the fault of all compositions of the same kind, that of representing a state of society which does not exist. His 'Tod Abels,' 'The Death of Abel,' written in prose, has ensured to its author a more lasting reputation. In his narrative he has given full scope to his poetical fancy, without however overstepping the boundaries of probability, or laying himself open to the charge of profaneness. But the genuine pathos of the sentiments and the sketch of the patriarchal manners constitute the great charm of the work. The character of Mehala, Cain's wife, is peculiarly interesting. His 'First Navigator' is also a pleasing fiction. Gessner enjoyed much popularity in his lifetime, both among his countrymen and among strangers, and his works were translated into various languages. His habits were simple and domestic. Madame de Genlis gives a curious account of a visit that she paid to Gessner at his country-house near Zürich, and of the interior of his family. Condorcet has written his biography. Gessner died at Zürich in 1787. His correspondence and miscellaneous poems were published after his death. Gessner engraved several of his own landscapes, which are much esteemed.

GETA, ANTONINUS, younger son of the emperor Septimius Severus, born about A.D. 190, was made Cæsar and colleague with his father and brother in 208. The most remarkable circumstance recorded of him is the dissimilarity of his disposition from that of his father and brother, who were both cruel, while Geta was distinguished by his mildness and affability. He is said to have several times reproved his brother for his proneness to shed blood, in consequence of which he incurred his mortal hatred. When Severus died at Eboracum (York) in 211, he named both his sons as his joint-successors in the empire. The soldiers, who were much attached to Geta, withstood all the insinuations of Caracalla, who wished to reign alone, and they insisted upon swearing allegiance to both emperors together. After a short and unsuccessful campaign against the Caledonians, the two brothers,

with their mother Julia, proceeded to Rome, where, after performing the funeral rites of their father, they divided the imperial palace between them, and at one time thought of dividing the empire likewise. Geta, who was fond of tranquillity, proposed to take Asia and Egypt, and to reside at Antioch or Alexandria; but the empress Julia, with tears, deprecated the partition, saying that she could not bear to part from either of her sons. After repeated attempts of Caracalla to murder Geta, he feigned a wish to be reconciled to his brother, and invited him to a conference in their mother's apartment. Geta unsuspectingly went, and was stabbed by some centurions whom

Coin of Geta.

British Museum. Actual size. Copper. Weight 312 grains.

Reverses of Coins of Geta.

Caracalla had concealed for the purpose. His mother Julia tried to screen him, but they murdered him in her arms, and she was stained by his blood and wounded in one of her hands. This happened in 212, under the consulship of two brothers of the name of Asper. After the murder Caracalla began a fearful proscription of all the friends of Geta, and also of those who lamented his death on public grounds. [CARACALLA.] (Spartianus, in *Historia Augusta*; Herodianus, book iv.; Dion, book lxxvii.)

GHIBELINS, or GIBELINES. [GUELFs and GIBELINES DANTE.]

GHIBERTI, LORENZO. Of this sculptor, who makes an epoch in the history of Italian and modern art generally, the precise year of his birth is not known; for though Vasari states it to have been 1380, it is more probable that it was rather earlier; and accordingly some of his later biographers have presumed it to be 1378. He was born at Florence, where he received his first instructions in drawing from his stepfather Bartoluccio, who practised 'oreficeria,' a branch of art at that time in high repute, and extending to designing all kinds of ornamental work in metals. He also acquired some practice of painting in his youth, and executed a fresco in the palace of Pandolfo Malatesta at Rimini, in 1401, the year following that in which he left Florence, on account (as he himself informs us in the memoir relative to the competition for the bronze gates of the Baptistery) of a pestilence in the city, and the distressed state of affairs. We learn from the same source that he applied himself with great diligence and ardour to this task, his mind being almost entirely engrossed by painting; but hardly had he completed it when a circumstance took place which proved the means of his signalling himself, not only as the greatest sculptor of his own times, but as one whose works have excited the admiration of after-ages. This was no other than the competition for a second pair of bronze doors for the Baptistery at Florence, worthy to accompany those executed by Andrea Pisano about 1340. This memorable competition attracted all artists of any eminence, and from among their number, seven, including Donatello, Brunelleschi, and Ghiberti, were chosen to make trial of their skill, the subject given them being the Sacrifice of Isaac, to be executed in bas-relief as a model for one of the panels. Of the designs produced on this occasion two have been preserved, namely those of Ghiberti and Brunelleschi, both of which are engraved in Cicognara's 'Storia della Scultura.' Neither of them is free from a certain stiffness in the attitudes, but Ghiberti's exhibits greater elegance in the forms and more judicious composition: Brunelleschi himself not only felt the superiority of his rival, but generously avowed it, and refusing to take any share in the work, solicited that all the sculptures might be entrusted

to Ghiberti alone. These doors, which contain twenty compartments, or panels, filled with as many reliefs, consisting of scriptural subjects, besides a profusion of ornamental work in the intermediate spaces, obtained from Michel Angelo the well-known eulogium, that they were worthy to be the gates of Paradise. Yet a modern critic (Von Rumohr), whose discrimination, as well as his intimate acquaintance with early Italian art, entitles his opinion to more than ordinary respect, says that although they display great invention and admirable skill, they in some respects fall short of those by Andrea Pisano, who treating his subjects with greater simplicity, and more conformably with the principles of sculpture, avoided the confused and crowded appearance which prevails in those of Ghiberti. The latter, he goes on to say, give us the spirit of painting working upon materials belonging to the plastic art; so that in order to be fully appreciated and enjoyed, they ought to be looked upon as pictures rather than as mere sculptures—for as such their author evidently conceived them.

Remarks of a similar tendency have been made by others, who have objected to the attempt to give the effect of perspective and distance by means of various degrees of relief as utterly futile, because the parts which are nearly in full relief must inevitably throw shadows on those next them, although these latter may be intended to represent objects at a considerable distance beyond them. On the other hand these productions of Ghiberti display extraordinary genius, an attentive study of nature, and a sudden emancipation from that formal traditional style of design and composition which had till then been adhered to by the Italian masters of that period. An excellent cast of these remarkable gates is in the Renaissance Court at the Crystal Palace, Sydenham.

Ghiberti afterwards executed for the same building another pair of bronze doors, containing ten reliefs upon a larger scale, representing various subjects from the Old Testament—those of the first door being entirely from the New. Being thus limited as to their number, he endeavoured to render each history as complete as possible, by combining in each compartment four distinct actions. In the first, for instance, he has introduced the creation of Adam, that of Eve, their disobedience in tasting the forbidden fruit, and their expulsion from Paradise—amounting in all to a great number of figures. Among his other works may be mentioned the admirable bronze relief in the Duomo at Florence, representing San Zenobi bringing a dead child to life, and the three bronze statues of St. John the Baptist, St. Matthew, and St. Stephen, at the church of Or San Michele in the same city. He also painted on glass and executed some of the windows in the Duomo. He was even appointed Brunelleschi's coadjutor in the erection of the cupola of the edifice just mentioned; and was consulted by artists and their patrons upon every important undertaking. The exact time of his death is not known, but it is supposed to have happened shortly after he made his will, which was dated November 1455, when he was about seventy-seven years old.

Several of the bas-reliefs of the second or larger door of the Baptistery, namely, that facing the Duomo, have been engraved by Piroli for a work on the monuments of Modern Italy, previous to the time of Raffaele; and a very interesting kind of artistical biography of him, including notices of all his most celebrated contemporaries, has been published by August Hagen, under the title of 'Die Chronik seiner Vaterstadt vom Florentiner Lorenz Ghiberti,' 1833.

GHIRLANDAIO, DOMINICO CORRADI, called DEL GHIRLANDAIO, from the profession of his father, a maker of a kind of garland worn by children, one of the old Florentine painters, was born in 1451, and died in 1495. He was fertile in invention, and later artists often made use of his works. He was one of the first who, with some correctness of outline, gave character to the face; and was the first Florentine whose works evince a due knowledge of perspective. His greatest works, consisting of events in the lives of St. Francis, the Virgin Mary, and St. John the Baptist, are in the Sassetti chapel, the church of the Holy Trinity, and the choir of the church of Santa Maria Novella. He painted in the Sistine chapel the 'Resurrection of Christ,' which has perished, and the 'Call of St. Peter and St. Andrew,' which yet remains. He is said by Lanzi to have also excelled as a worker in mosaic. His brothers, David and Benedetto, were not equal to him. RIDOLFO GHIRLANDAIO, his son, born about 1485, died in 1560, was a pupil of Fra Bartolomeo and a friend of Raffaele, some analogy with whose genius, but with inferior powers, may be traced in his pictures. Dominico has the honour of numbering among his pupils Michel Angelo Buonarroti.

GIANNONE, PIETRO, born at Ischitella, in the province of Capitanata, in 1676; studied at Naples, and applied himself to the profession of the law. From the profits of his practice he managed by assiduous labour and economy to purchase a small country-house, where he spent all the time he could spare from his professional occupations, and where he wrote his great work, 'Storia Civile del Regno di Napoli,' 4 vols. 4to, 1724. Unlike most other historians who had preceded him, and whose narratives were merely chronicles of kings and wars and battles, Giannone laboured particularly to investigate the history of civil institutions, the laws, the manners, and the government of the various countries which were afterwards united by the Normans into one state, called by the various names of the dukedom of Puglia and Calabria, Sicily *citra* Pharum, and lastly the kingdom of Naples; and then to describe the changes in the institutions of the

monarchy under the Normans, the Swabians, the Anjous, and the Aragonese, and in the time of Charles V. and the Spanish conquest. He next relates the events of two centuries of the Spanish vice-regal administration down to the year 1700. 'Storia del Reame di Napoli,' 1834, by Collotta, is a continuation of Giannone's work.

A principal object of Giannone was to draw the distinction, so long left undefined, between the spiritual and the secular powers, and to show by what means and gradual steps the Church of Rome, or rather its hierarchy, had trespassed upon those limits, until at last, "having invaded every civil jurisdiction, it strove to render the empire wholly subservient to the priesthood." ('Storia Civile,' b. i. ch. 2.) The profound learning of the author in the history and practice of the jurisprudence of the dark and middle ages, and the frequent citation of his authorities, constitute the chief merits of the work. In other respects he has been charged by some and not unfriendly critics with occasional historical and chronological inaccuracies; with borrowing without acknowledgment from Costanzo, Summonte, and other writers who had preceded him; and also with displaying throughout his work a spirit of fixed hostility to the clergy not always restrained within the limits of historical impartiality. But the pretensions of the ecclesiastical power were in Giannone's time so exorbitant, their encroachments so formidable, and their intermeddling so vexatious, as to sour the naturally irritable temper of Giannone, who felt already, and was also warned by his friends, that his boldness would cost him dear. Naples was then under the dominion of the Emperor Charles VI., whose government was rather favourable to Giannone's views; this however did not prevent the author from being assailed, after the publication of his work, by the clerical party, and being openly insulted in the streets of the capital. Being obliged to leave Naples, he went to Vienna, where the emperor assigned him a small pension out of the Neapolitan treasury. Meantime his book was solemnly condemned by the Inquisition at Rome, and a monk wrote a refutation of it, in which he undisguisedly asserted the absolute authority of the pope over the temporal state—'Della Potestà Politica della Chiesa: Trattati due del Padre G. A. Bianchi contro le Nuove Opinioni di Pietro Giannone,' 5 vols., Rome, 1745. In the year 1734 the Austrians lost the kingdom of Naples, and Giannone, who lost his pension at the same time, repaired to Venice in quest of employment, but he there incurred the suspicion of the government, and was ordered away in 1735. He then took refuge at Geneva, where he completed a work which he had begun at Vienna, called 'Il Trirregno, ossia del Regno del Cielo, della Terra, e del Papa,' in which he no longer confines his attacks to the temporal pretensions of the papal see, but impugns also several dogmas of the Roman Catholic Church. The book was never printed, though manuscript copies of it were circulated, and a copious extract of it is found in the biography of Giannone by Leonardo Panzini. Giannone however was, or thought himself, all the while a true member of the Romish Church; and as he wished to take the sacrament at Easter, and there was then no Roman Catholic church at Geneva, he listened to the advice of a pretended friend from Savoy, who invited him to pass over the border of the Genevese territory to a neighbouring village, where he could perform the sacred rite. The advice was treacherous; Giannone, as soon as he entered the territory of Savoy, was arrested, in 1736, and taken to the castle of Miolans, whence he was transferred to the fortress of Ceva, and lastly to the citadel of Turin, by order of the King of Sardinia. He was treated however with some degree of attention, but never recovered his liberty, and he died in the citadel of Turin, in March 1748, at the age of seventy-two, after twelve years of imprisonment. During his captivity he had conferences with a priest, and was induced to abjure the opinions which had been condemned by Rome, and was consequently relieved from the interdiction by the Inquisition. After the accession of Don Carlos of Bourbon to the throne of Naples, that sovereign sent for the surviving son of Giannone, and assigned to him a liberal pension, stating by an edict, dated Portici, May 8, 1769, "that it was unbecoming the interest and the dignity of his government to leave in distress the son of the most useful subject and the most unjustly persecuted man that the age had produced." (Cormani, 'Secoli della Letteratura Italiana'; Botta, 'Storia d'Italia,' b. xli.) Giannone's 'Opere Postume,' chiefly in his own defence, were published at Lausanne after his death.

GIARDINI, FELICE, one of the greatest violinists of the last century, who contributed largely to an improved manner of performing in England, was born at Turin, in 1716, and entered as a chorister in the cathedral at Milan, where he received his elementary education in singing, on the harpsichord, and in composition, and at the same time studied the violin under Lorenzo Gomis, a favourite disciple of Corelli. At the age of seventeen he joined the orchestra of the Opera at Naples; then, making the usual tour of the Italian theatres, visited Germany, and at Berlin excited a *furor* by his performance on the instrument which he early adopted. Giardini, coming to our shores in 1750, immediately distinguished himself, and speedily was appointed to almost every situation of honour and profit that a great violinist could obtain in the British capital. In 1756, joining with the famous cantatrice Mingotti, he became manager of the King's Theatre, an office for which he was so little qualified that he soon abandoned it, having sustained a considerable loss by his inconsiderate undertaking. But, untaught by experience, he and his former partner,

eight years afterwards, once more embarked in the same concern, and in two years were again compelled to retire from an enterprise so ruinous when not understood. He now pursued his profession as a leader, and also gave lessons in singing. In 1784 he went to Naples, where he became a guest of Sir W. Hamilton, the English minister, and a very superior performer on the violin. In 1789 he returned to England, but was coldly received, and failed in establishing a burletta-opera at the little theatre in the Haymarket. In 1793 he took his burletta troupe to St. Petersburg, then to Moscow, but was as unsuccessful in Russia as in London. After experiencing many disappointments—the result of bad judgment, singular imprudence, defeated cunning, and habits not over scrupulous—he died at St. Petersburg, in a state of great poverty, in 1796. Giardini possessed much imagination and a fine taste. He composed partly three Italian operas, and one entirely. His English oratorio, 'Ruth,' continued to be performed many years; and his songs, 'Let not Age,' 'Tis not Wealth' (in 'Love in a Village'), with a few others, are still admired by the lovers of pure melody; besides which, he published many quintets, quartets, trios, &c., for violins, and also six harpichord sonatas; but his instrumental music is now forgotten, and the probability is that, being deficient in depth and vigour, it will never be revived.

GIBBON, EDWARD, was born at Putney, in the county of Surrey, on the 27th of April 1737. He has given us in his 'Autobiography,' which was published after his death by Lord Sheffield, copious particulars concerning his life and writings. From his own account we learn that in childhood his health was very delicate, and that his early education was principally conducted by his aunt, Mrs. Porten. At the age of nine he was sent to a boarding-school at Kingston-upon-Thames, where he remained for two years, but made little progress, in consequence of the frequent interruption of his studies by illness. The same cause prevented his attention to study at Westminster school, whither he was sent in 1749, and "his riper age was left to acquire the beauties of the Latin and the rudiments of the Greek tongue." After residing for a short time with the Rev. Philip Francis, the translator of Horace, he was removed in 1752 to Oxford, where he was matriculated as a gentleman commoner of Magdalen College in his fifteenth year. Though his frequent absence from school had prevented him from obtaining much knowledge of Latin and Greek, his love of reading had led him to peruse many historical and geographical works; and he arrived at Oxford, according to his own account, "with a stock of erudition that might have puzzled a doctor, and a degree of ignorance of which a school-boy would have been ashamed." His imperfect education was not improved during his residence at Oxford; his tutors he describes as easy men, who preferred receiving the fees to attending to the instruction of their pupils; and after leading a somewhat dissipated life for fourteen months, he was compelled to leave Oxford in consequence of having embraced the Roman Catholic faith. His conversion was effected by the perusal of Dr. Middleton's 'Free Inquiry into the Miraculous Powers possessed by the Church in the Early Ages,' in which he attempts to show that all the leading doctrines of the Roman Catholic Church are supported by the miracles of the early fathers, and that therefore the doctrines of the Church of Rome must be true, or the miracles false. Gibbon's early education had taught him to revere the authority of these fathers; he was induced to read some works in favour of the Roman Catholic faith; and in 1753, he, "solemnly, though privately, abjured the errors of heresy." With the object of reclaiming him to Protestantism, his father sent him to Lausanne in Switzerland, to reside with M. Pavillard, a Calvinist minister. The arguments of Pavillard and his own studies had the effect which his father desired; in the following year he professed his belief in the doctrines of the Protestant Church, and, according to his own statement, "suspended his religious inquiries, acquiescing with implicit belief in the tenets and mysteries which are adopted by the general consent of Catholics and Protestants." He remained in Switzerland for five years, during which time he paid great attention to study, and assiduously endeavoured to remedy the defects of his early education.

During his residence at Lausanne, he had become perfectly acquainted with the French language, in which he composed his first work, entitled 'Essai sur l'Étude de la Littérature,' which was published in 1761. "It was received with more favour on the Continent than in England, where it was little read and speedily forgotten." His studies after his return to England were much interrupted by attention to his duties in the Hampshire militia, in which he was appointed captain; and the knowledge of military tactics, which he acquired in this service, was not, to use his own words, "useless to the historian of the Roman Empire." During his visit to Rome in 1764, "as he sat musing amidst the ruins of the Capitol, while the bare-footed friars were singing vespers in the temple of Jupiter, the idea of writing the decline and fall of the city first started to his mind." Many years however elapsed before he began the composition of the 'Decline and Fall.' On his return to England, he commenced a work on the Revolutions of Florence and Switzerland; and in conjunction with a Swiss friend of the name of Deyverdun, published in 1767 and 1768 two volumes of a work entitled 'Mémoires Littéraires de la Grande Brétagne.' His next work, which appeared in 1770, was a 'Reply to Bishop Warburton's Interpretation of the Sixth Book of the Æneid.' In 1774 he was

returned to parliament by the interest of Lord Eliot for the borough of Liskeard; and for eight sessions he steadily supported by his vote though he never spoke, the ministry of Lord North, for which he was rewarded by being made one of the commissioners of trade and plantations, with a salary of 800*l.* a year. In the next parliament he sat for the borough of Lymington, but resigned his seat on the dissolution of Lord North's ministry, when he lost "his convenient salary, after having enjoyed it about three years." During the time in which he was a member of parliament, he published, in the French language, at the request of the ministry, a pamphlet entitled 'Mémoire Justificatif,' in reply to the French manifesto and in vindication of the justice of the British arms. In 1776 the first volume of the 'Decline and Fall of the Roman Empire' appeared in 4*to*, and was received by the public in the most favourable manner: "the first impression was exhausted in a few days; a second and third edition were scarcely adequate to the demand." The second and third volumes, which terminated the history of the fall of the Western Empire, were published in 1781.

In 1783 he left England, and retired to Lausanne, to reside permanently with his friend M. Deyverdun. From this time to 1787 he was engaged in the composition of the last three volumes of his great work, which appeared in 1788. He spent some time that year in England to superintend the publication, and again returned to Lausanne, where he remained till 1793, when the death of Lady Sheffield recalled him to his native country to console his friend. He died in London on the 16th of January 1794.

The 'Decline and Fall of the Roman Empire' comprises the history of the world for nearly thirteen centuries, from the reign of the Antonines to the taking of Constantinople by the Turks; for the author does not confine himself to the history of the princes that reigned at Rome and Constantinople, but gives an account of all the various nations of the east and west which at any period influenced the destinies of the Roman empire. In the prosecution of this design it was impossible for the historian to neglect the history of the Christian Church, which he properly considered as "a very essential part of the history of the Roman empire." Gibbon accordingly, in the course of his work, entered fully into the history of the Church, and in the first volume devoted two chapters to an account of the early progress and extension of Christianity. In relating the causes that occasioned the spread of Christianity, he was understood to have sought to undermine the divine authority of the system; and numerous works were published in opposition to his opinions, to none of which did he make any reply "till Mr. Davis presumed to attack not the faith, but the fidelity of the historian;" when he published his 'Vindication of the Fifteenth and Sixteenth Chapters of his History.' Gibbon's Sketch of Ecclesiastical History is perhaps the best work on the subject in our language; but he writes rather as an advocate than as an historian, and though he seldom if ever wilfully perverts facts, yet he seizes every opportunity of casting ridicule upon the faith which he disbelieved.

The principal fault of Gibbon's history is owing to the extent and variety of the subject-matter. He included in his plan the history of so many nations that no single individual could do justice to every particular. The reading of Gibbon was very extensive, but yet not sufficiently extensive to give an accurate history of the world for thirteen centuries. His knowledge of Oriental history is often vague and unsatisfactory, and his acquaintance with the Byzantine historians is said by those who have studied the subject to be superficial. But, with all his defects, the 'Decline and Fall' was a great accession to literature; Niebuhr indeed pronounced it "a work never to be excelled." It connects ancient and modern history, and contains information on many subjects which historians generally neglect and sometimes unsuccessfully attempt. Thus, in the 44th chapter, he gives an historical account of the Roman law, which is perhaps one of the best introductions to its study that we possess, and was considered by a celebrated foreign lawyer, Professor Hugo, to be worthy of a translation. Hugo published it at Göttingen, in 1789, under the title of 'Gibbon's historische Uebersicht des Römischen Rechts.' The 'Decline and Fall' has been translated into almost all the European languages. The last edition of the French translation contains notes on the history of Christianity, by M. Guizot; and in a biography of Gibbon, by the same writer, in the 'Biographie Universelle,' he has expressed his opinion of the chief merits and defects of the 'Decline and Fall.'

The 'Decline and Fall' was also published in 12 vols. 8vo, London, and has since been frequently reprinted. In the most convenient edition of the 'Decline and Fall,' that edited by Dr. William Smith, 8 vols. 8vo, 1854-55, are embodied the more important notes of Guizot, the equally valuable ones of Wenck, the German translator, with those by Deau Milman intended to correct the ecclesiastical bias of the historian, and a judicious selection from the comments of other authorities, while the references are throughout verified. His 'Miscellaneous Works,' with memoirs of his life and writings composed by himself, were published by Lord Sheffield in 2 vols. 4*to*, 1796; to which a third volume was added in 1815. The 'Miscellaneous Works' were reprinted in the same year in 5 vols. 8vo. This collection contains a republication of some of the works which have been already mentioned; and in addition to these, a large 'Collection

of Letters written by or to Mr. Gibbon; 'Abstracts of the Books he read, with Reflections;' 'Extracts from his Journal;' 'Outlines of the History of the World;' 'A Dissertation on the Subject of L'Homme au Masque de Fer;' 'Antiquities of the House of Brunswick;' 'Mémoire sur la Monarchie des Medes;' 'Nomina Gentesque Antiquae Italiae;' 'Remarks on Blackstone's Commentaries;' 'On the Position of the Meridional Line, and the supposed Circumnavigation of Africa by the Ancients,' and other pieces of less importance.

GIBBONS, GRINLING, an artist celebrated for the extraordinary taste and delicacy of execution he displayed in wood-carving, is supposed to have been of Dutch origin, though a native of London, where he was born in Spur Alley, Strand, in 1648. Having been recommended by Evelyn to Charles II., the king bestowed upon him a place in the Board of Works, and employed him in the chapel of Windsor, where he executed much of the ornamental carving, consisting of such emblematic objects as doves, pelicans, palm-branches, &c. For the choir of St. Paul's he likewise did much of the foliage and festoons belonging to the stall-work, and those in lime-trees which decorate the side aisles of the choir. There is a great deal of his work at Chatsworth—mere ornament indeed, such as foliage, flowers, feathers, &c., but finished with such exceeding delicacy and truth, that the workmanship not only confers value on the material, but also on the subject. Occasionally he exerted his skill on subjects altogether trivial in themselves, and merely curiosities in art; for instance, feathers and pens that might be mistaken for real ones; and such productions as the point-lace cravat wrought up in wood, which he presented to the Duke of Devonshire on completing his labours at Chatsworth. At Southwick, in Hants, he did the embellishments of an entire gallery; and also a room at Petworth, which last has generally been considered one of his chief performances. All these works were merely ornamental, and analagous to what is termed still-life in painting, and it is by them that he was distinguished; yet that Gibbons had talents for those of a higher character is proved by his statue of James II., behind the Banqueting House, Whitehall. In his own peculiar walk Gibbons has probably never been equalled for exuberant fancy and exquisite skill in execution. Unfortunately the wood in which most of his works are carved appears to be suffering from the ravages of insects, but Mr. Rogers, who in our day has almost rivalled the skill of Gibbons in wood-carving, has shown that it is possible to arrest the progress of the evil. He died August 3, 1721.

GIBBONS, ORLANDO, who was not only "one of the rarest musicians of his time," as Anthony Wood styles him, but one of the finest geniuses that ever lived, was born at Cambridge in 1583. At the age of twenty-one he became organist of the Chapel-Royal. In 1622 he was honoured, at Oxford, with the degree of Doctor, on the recommendation of his friend Camden, the learned antiquary. In 1625, attending officially the ceremonial of the marriage of Charles I., for which occasion he composed the music, he took the small-pox, and died on the Whit-Sunday following. He was buried in Canterbury Cathedral, where a monument, erected to his memory by his wife, is one of the objects that attract the notice of visitors to that noble structure.

It is observed by the biographer of Gibbons in the 'Harmonicon,' that "the sacred works of Gibbons are still fresh and in constant use. His service in F is indeed above all praise for novelty, and for richness and purity of harmony. His three anthems, 'Hosanna, to the Son of David,' 'Almighty and everlasting God!' and 'O clap your hands together,' are masterpieces of the most ingenious and scientific writing in fugue that musical skill ever brought forth. But next to his service, we must avow our preference for his madrigals: 'Dainty sweet Bird,' and 'O! that the learned Poets,' are far above most other things of the kind; and 'The Silver Swan' is even superior to both of these—superior, not in elaborate contrivance, for it is comparatively simple, but in effect—the great and only true touchstone of art."

Dr. Gibbons left a son, Christopher, who at the Restoration, besides being appointed principal organist to the king, and to Westminster Abbey, was created Doctor in Music by the University of Oxford, in consequence of a letter written by Charles II. himself, which is inserted in the 'Fasti Oxon.' He was celebrated for his organ-playing, and is said to have instructed Dr. Blow on this instrument. Orlando had also two brothers, Edward, organist of Bristol, and Ellis, organist of Salisbury. The former was sworn in a gentleman of the Chapel-Royal in 1604, and was master to Matt. Lock. During the civil wars he assisted Charles I. with the sum of 1000*l.*, for which he was afterwards deprived of a considerable estate, and, with his three grand-children, thrust out of his house, at a very advanced age. In the 'Triumphs of Oriana' are two madrigals by Ellis Gibbons.

GIBBS, JAMES, an architect of considerable eminence in his day, was born about 1674 at Aberdeen, where he was educated and took the degree of Master of Arts at the Marischal College. In his twentieth year he visited Holland, where he entered into the employment of an architect, with whom he continued till 1700, when, by the advice and aided by the assistance of his countryman the Earl of Mar, who had himself a taste for architecture, he proceeded to Italy in order to improve himself in his art. Diligence he did not lack, and therefore, as far as relates to making studies, sketches, and memoranda, he may be said to have employed his time successfully; yet that he wanted

discrimination, and the ability to improve upon his models, is too plainly attested by nearly all his works. After spending ten years in Italy, during several of which he studied at Rome under an architect named Garroli, he returned to England, and found his patron, the Earl of Mar, in the ministry. By that nobleman he was recommended to the commissioners for building the fifty new churches, and this circumstance opened to him those opportunities which in the opinion of his admirers he employed so worthily. Another ten years however elapsed before he was called upon to make trial of his ability in any of the metropolitan churches, for his first one, namely, St. Martin's, was not commenced till 1720-21. In the interim he erected what is called the new building at King's College, Cambridge, a design which, with many palpable faults, is not distinguished by originality or any other excellence. If this work is little spoken of (St. Martin's), which was completed in 1726, it has been liberally extolled not only as its author's *chef d'œuvre*, but as a first-rate piece of architecture, chiefly it would seem as an application of a portico upon a satisfactory scale and at a time when such a feature was by no means so common as it has since become. Certain it is, that, in regard to the exterior at least, few have extended their eulogium to any other part of it; yet for the portico—borrowed from the Pantheon at Rome—he found a model ready prepared to his hands, requiring only to be adapted to a specific purpose, and if in selecting it he paid a tribute to the classical grandeur of the original, he seems to have looked at it only with the eye of a copyist. Every other feature of the building is at variance with the portico and the order; lumpish, heavy, and uncouth, without even anything of that picturesque richness which sometimes results from exaggerated details and other subordinate forms; and the interior is not at all better. For this church Gibbs submitted two other designs, which he himself, he tells us, considered preferable to the one executed. They are both given in the folio volume of designs which he published in 1728. Much as those differ from the present building—the body of the church in both of them being circular in its plan (about 95 feet in diameter)—so far from displaying invention, they show, even in the way of alteration, very little more than was absolutely called for by such change of the general form. The taste manifested in them partakes far more of Holland, the country where Gibbs made his first sojourn abroad, than of classical Rome. The same remark will apply to his next work, the church of St. Mary in the Strand, an exceedingly heterogeneous composition, with nothing in its ensemble to reconcile us to its individual solecisms.

In the church of All Saints at Derby, where he added a new body to the old Gothic tower, he did little more than repeat, with some slight variation, what he had done for St. Martin's. He also built Marylebone Chapel, the upper part of the steeple of St. Clement's Dances, and St. Bartholomew's Hospital. His best work is the Radcliffe Library at Oxford, a rotunda about 140 feet in diameter externally, covered by a dome 105 feet in diameter; for, notwithstanding that the niches and some other parts are the reverse of elegant, and that the building seems very ill adapted to its purpose, there is some approach to simplicity in the general mass and its contours, and something of grandeur in the interior. To this library, which was begun in 1737 and completed in about ten years, and the designs for which he published in a separate volume, containing 23 plates, Gibbs made a valuable bequest of books. He died August 5th, 1754, and having never been married, left his property, amounting to about 15,000*l.*, to different individuals and public charities.

The works of Gibbs certainly do not display either grace or happiness of invention. They have for the most part all the heaviness of Vanbrugh's designs, without their other redeeming qualities. They discover neither an innate nor acquired perception of beauty in forms and of harmony in their combination. Nevertheless, in respect of what he almost accidentally borrowed on one occasion, he is generally spoken of, not as a judicious copier, but as an artist of original mind and unquestionable genius.

GIBSON, DR. EDMUND, Bishop of London, born 1669, died 1748. Bishop Gibson was the son of Edmund and Jane Gibson, of the parish of Baampton, in Westmorland. He pursued his studies with great vigour, first in his own county and then in the University of Oxford, of which perhaps the best proof that could be required is given by his having at the age of twenty-two prepared an edition of the 'Saxon Chronicle,' with a translation into Latin, and suitable indexes and other assistances in the use of that valuable historical remain. The work was printed at Oxford in 1692 in a 4to volume. At that early period of his life he projected and accomplished an enlarged edition of the English translation of Camden's 'Britannia,' and he had already acquired fame and interest sufficient to engage in his assistance many antiquaries in different parts of the kingdom, by whose contributions the work was enriched, and came forth from the hands of Dr. Gibson a great improvement on the old English edition of Philemon Holland. This work appeared in 2 vols. fol. in 1695. It appeared again in an enlarged form in 1722, and again in 1772. Richard Gough, an eminent topographical scholar, enlarged it still more, and it appeared in 3 vols. fol. in 1789. It was still further enlarged to 4 vols. fol. in 1806. Another early production of Dr. Gibson was an edition of some historical remains of the eminent antiquary Sir Henry Spelman, which was published at Oxford in 1698, under the title of 'Reliquiæ Spelmanianæ.' These works show the original predisposition of Bishop Gibson's

mind; but he did not at that period of his life confine himself to historical literature, for in 1693 he produced an edition of 'Quintilian,' which is highly esteemed.

The proof of industry and learning which these works afforded introduced him to the notice and favour of Tenison, who in 1694 succeeded Tillotson as archbishop of Canterbury. He was made domestic chaplain to the archbishop, and rector of the parish of Lambeth. He was also made archdeacon of Surrey.

In the reigns of King William and Queen Anne there was a warm controversy concerning the nature and authority of the convocation of the clergy. In this controversy Dr. Gibson took a very active part, defending the power of that assembly, in which his historical knowledge was made to bear powerfully on the question. This led to the publication which is regarded as his great work, the 'Codex Juris Ecclesiastici Anglicani,' 2 vols. fol., 1713, in which he has collected the statutes, constitutions, canons, rubrics, and articles of the Church of England, and digested them methodically under proper heads, with suitable commentaries, prefaces, and appendices, forming together a work which is indispensable to the studies of those who desire to understand thoroughly the history of the English Church. It was reprinted at Oxford in 1761.

In 1715 Dr. Gibson was promoted to the bishopric of Lincoln, and in 1723 translated to London. Wake, the archbishop of Canterbury, was at that time in an infirm state of health, and so continued for some years, during which period the Bishop of London was the person chiefly consulted by the court in affairs belonging to the Church.

Bishop Gibson was ever a strenuous defender of the rights of the Church, considered as a political community; but he was of what is called the liberal school in respect of doctrines, and he warmly approved of the liberty which the law had granted in his time to persons not conforming to the Church, to meet together publicly for social worship in whatever way and on whatever principles they might themselves approve. He published a large collection of treatises which had been written by divines in the English Church against popery, forming three folio volumes, printed in 1738. His 'Pastoral Letters' is the last of his works we have occasion to mention, in which he combats at once unbelief and enthusiasm.

In his private relations Bishop Gibson was greatly beloved and respected. He died in 1748, and was buried at Fulham, with many of his predecessors.

GIBSON, JOHN, R.A., was born at Conway, North Wales, in 1791. When the boy was about nine years old, his father, a landscape gardener, finding his circumstances growing less prosperous, removed to Liverpool, with the view of emigrating to America. He was induced however to settle in Liverpool; and to that change of purpose must doubtless be ascribed the direction which the studies of our great sculptor eventually took—perhaps the very fact of his becoming a sculptor. At Liverpool a new world opened before the boy. While yet a child at Conway, he had been accustomed to draw on pieces of slate the geese, and sheep, and horses he saw about the fields and roads; and under his mother's fostering care had acquired a good deal of facility, for his age and circumstances, in drawing any simple object that caught his fancy. At Liverpool he for the first time saw in the shop-windows engravings and pictures of a higher order than the homely prints which hung upon the walls of his father's cottage. On these he would gaze on his way to and from school, till they were so thoroughly impressed on his mind, that on returning home he could draw them from memory—subsequent visits being made to correct the errors in his first effort, and to fill in the minor features. He thus strengthened his memory and increased his skill, and among his schoolfellows, soon coming to be looked upon as a prodigy, he found juvenile admirers very willing to exchange pence and halfpence for his drawings. All his ambition now was to be a painter, but his father had neither means nor inclination to indulge his desire. At the age of fourteen he was apprenticed to a cabinet-maker; but after a time turned over to a wood-carver. For this employment he conceived a growing distaste, and at last, when about sixteen, he was relieved from it by the Messrs. Francis of the marble-works, who, having become acquainted with his remarkable fondness for art, and skill in drawing, purchased his remaining time for 70*l.*, and encouraged his abilities in designing, modelling, and the use of the chisel; giving him every facility, and treating him with great consideration. By Mr. Francis he was introduced to Roscoe, the author of the 'Life of Lorenzo de Medici,' who invited him frequently to his elegant seat, Allerton Hall—placed the treasures of art it contained at his service, and directed him to the purest models in ancient art. Mr. Roscoe seems to have intimated his intention of sending his young protégé, at his own expense, to Rome, to complete his art-education, but the commercial losses, which about this time overtook him, put it out of his power to fulfil his intention. He mentioned the subject however to some of his wealthy friends, and a subscription being privately set on foot, a sufficient sum was soon raised to carry the young sculptor to the metropolis of art, and satisfy his moderate requirements there for a couple of years.

An introduction having been obtained to Canova, then the acknowledged sovereign of art in Rome, Gibson set out in 1817 on his pilgrimage. On his way he visited London, where he met with a kind reception from Flaxman, who praised his works, urged him to renewed

efforts, and commended his purpose of visiting Italy. Furnished with additional letters to Canova, Gibson continued his journey, and in the October of 1817 arrived in Rome. The great Italian sculptor gave him a cordial welcome; assured him that with steady industry he would be certain to achieve greatness; promised him every aid that he could render, and begged that he would not let any pecuniary wants disquiet him. The young man had no need of pecuniary aid, and told Canova so; but he entered his studio, and became one of his most diligent and successful pupils.

Gibson set up on his own account in 1821, and the kindness of his old master followed him to his studio. The first independent work he modelled was a group of 'Mars and Cupid,' and Canova carried the Duke of Devonshire to see it. The duke, struck by its merits, directed the artist to execute it in marble. This, Gibson's first commission, now forms one of the leading features of the magnificent collection at Chatsworth. Another of Gibson's earliest works was a group of 'Psyche and the Zephyrs,' executed in marble for another munificent patron of English artists, Sir George Beaumont: of this work Gibson was called upon to execute duplicates for Prince Torlonia and the Hereditary Grand Duke of Russia.

His success was already assured, but always striving after a higher excellence, as, during Canova's lifetime, Gibson had availed himself to the utmost of all the facilities which the great Italian sculptor opened to him, so, after the death of that eminent man, he did not hesitate, although now himself a master, to become again for a season a pupil of the great Danish sculptor Thorwaldsen. Thus, trained under the two most celebrated sculptors in Europe, Gibson entered on his career with hand and mind more thoroughly disciplined than perhaps any other English sculptor; and he has proved that this training did not, as might have been feared, repress his individuality, or lead him to become in any sense an imitator.

From the commencement of his course to the present time Mr. Gibson has devoted himself almost entirely to poetic sculpture; and it is by his works of this class that his ultimate rank will be estimated. Nor is there any question that this rank will be with the very first among the recent sculptors of Europe as well as of England. Thoroughly Greek in spirit, and for the most part turning to the old Grecian myths for his subjects, Gibson has never rested content with the mere reproduction of Greek forms and proportions. He has on the contrary breathed into the old fables a new life and spirit, giving to his Venuses and Auroras, his Helens and Sapphos and Proserpines—nay, even to the oft-repeated Cupids and Psyches, as well as to 'Greek Hunters,' 'Sleeping Shepherds,' and 'Wounded Amazons'—expression, character, and personality. Beyond almost any other English sculptor, Gibson appears to recognise and to appreciate the limits and the conventions of sculpture, and hence his works are always perfect in pose, exquisite in form, severe yet not cold in style, and free from all approach to flutter or meretricious elegance. In modelling he is very successful, and in the management of the chisel admirable.

We have indicated a few only out of his almost numberless classic and poetic works; to name even the greater works he has produced during five-and-thirty years of almost unremitted industry would occupy more space than we can here afford. In portrait statues Mr. Gibson is scarcely so happy as in poetic subjects. His principal works of this kind have been a statue of the Queen for Buckingham Palace, a modified repetition of it, and the yet unfinished seated statue of her Majesty for the Prince's Chamber in the palace of Westminster, which Gibson hopes to make his greatest and most successful work of this class; the colossal marble statues of Huskisson, for the Cemetery, Liverpool (repeated in bronze for the front of the Custom House in that town), and for Lloyd's Rooms, London; Sir Robert Peel, for Westminster Abbey; Mrs. Murray, exhibited at the Royal Academy in 1846; and George Stephenson, exhibited in 1851. He has also executed several monumental tablets and bassi-relievi—the latter some of them very beautiful, though inferior to his bas-reliefs of classic themes. As a monumental sculptor, Mr. Gibson insists on adhering to the now happily almost exploded principle of habiting his figures in classic costume. Thus Huskisson and Peel are made to stand before their countrymen not as members of the English House of Commons, but as Roman senators with English faces; an anachronism and an incongruity which, with all our respect for Mr. Gibson's great abilities, we cannot wish to see repeated, even though forced to put up as the alternative with the work of an inferior hand.

Within the last few years Mr. Gibson has lent the weight of his high reputation and example to an innovation which has caused a great deal of discussion,—that, namely, of applying colour to the marble in sculpture. This he did in his statue of the Queen, and some of his other works, very cautiously, and, as may be supposed, with the greatest taste; in the drapery and accessories of his great seated statue of her Majesty it is to be done more freely. But in recent poetic works he has gone farther. A 'Venus' exhibited by him in 1854 in a room set apart for the purpose in his residence at Rome, had the whole of the undraped figure tinted with colour mixed with wax; and the room was so fitted up as to bring out the full effect of the experiment. The statue is the property of an English gentleman, and Gibson found many eager to have repetitions of it, or others executed on a similar principle. Gibson defends the practice by a reference to Grecian precedents. But whoever may have originated

the practice, it is evident that it is one which makes a decided approach to the senuous; and, except in the hand of an artist who knows exactly how far to go and has sufficient judgment to stop there, it may easily pass into the voluptuous and meretricious. It is impossible here of course to discuss such a matter with any chance of arriving at a satisfactory conclusion; but it was necessary to allude to it, Gibson being the first English, if indeed he be not the first eminent modern sculptor by whom the practice was adopted or restored.

From his first visit there in 1817 to the present time Mr. Gibson has resided at Rome. His visits to his native country have been very few; the first was made after an absence of twenty-eight years. But in Rome his studio is the resort of all the patrons, the practitioners, and the lovers of art; and the great sculptor is always the kind and judicious adviser of his young fellow-countrymen who now enter the great metropolis of art on the same errand as that which nearly forty years ago drew him thither.

Mr. Gibson was elected A.R.A. in 1833, and R.A. in 1836. Always a fitful contributor, since 1851 he has sent nothing to the annual exhibitions of the Academy. England however possesses the larger part of his works, some one or more having found a place in almost every great collection in the country. Liverpool is especially rich in his works; he being regarded there with pride as a fellow-townsmen. Of English sculpture we have no national collection; but one of Mr. Gibson's poetic groups, though not one of his best ('Hylas and the Nymphs'), is in the Vernon Gallery. The best substitute however for a collection of the actual marbles has been provided in the Crystal Palace, Sydenham, where is a very fair selection of some twenty casts from so many of his fine groups and statues.

(*Memoir of Gibson*, by Mrs. Jameson, in the *Art Journal* for May 1849, &c.)

GIBSON, RICHARD, a celebrated dwarf and painter, and page (of the back-stairs) to Charles I., was born in 1615. He was the pupil of Francis Cleyn, and studied afterwards the works of Sir Peter Lely, whom he imitated. Lely painted his portrait in 1658. Gibson was only 3 feet 10 inches high, and he married, in the presence of Charles and his queen, Anne Shepherd, who was of exactly his own height. Waller wrote some verses on the occasion.

Gibson appears to have been an excellent painter, especially in water-colours. There is a very good drawing by him of Charles I.'s queen at Hampton Court. A miniature painting by him of the parable of the Lost Sheep was the cause of Abraham Vanderdoort's (keeper of the king's pictures) death; it belonged to Charles, who prized it very much, and he intrusted it to Vanderdoort, who put it away with such care that when the king asked him for it he could not find it, and he hauged himself in despair. It was found afterwards by his executors, and restored to the king. Gibson was patronised also by Philip, earl of Pembroke; and he is said to have painted Cromwell several times. He taught painting to the queens Mary and Anne, daughters of James II.

Gibson and his wife were painted several times: by Vandyck, by Dobson, and by Lely. Vandyck introduced his wife in the picture of the Duchess of Richmond at Wilton. They had nine children, five of whom lived to maturity, and attained the proper size. Gibson died in 1690, and his wife in 1709, aged eighty-nine.

* GIBSON, RIGHT HON. THOMAS MILNER, M.P., is the only son of Major Gibson of the 87th regiment, and was born in 1807. Having received his early education at the Charterhouse, he proceeded to Trinity College, Cambridge, where he graduated in 1830 as 36th wrangler. He entered parliament, as member for Ipswich, in 1837, as a supporter of the late Sir Robert Peel, but in 1839 avowed himself a convert to Liberal opinions, and, resigning his seat, devoted himself to the cause of Free Trade in conjunction with the Anti-Corn-Law League. The result was that in 1841 he was elected member for Manchester. In 1846, when Sir Robert Peel had passed his measures for the repeal of the Corn Laws, and Lord John Russell came into office for the purpose of carrying those measures into effect, Mr. Milner Gibson was sworn a member of the Privy Council, and was appointed Vice-President of the Board of Trade. He resigned that office however in 1848, feeling that he could better serve the interests of his constituents as an independent member of the House of Commons. He was an effective supporter of the repeal of the stamp on newspapers, which was at last effected in June 1855. Of late years he has taken considerable interest in the question of a national system of education.

GIFFORD, WILLIAM, a political writer and critic of no small influence in his lifetime, was born at Ashburton, in Devonshire, in April 1757. He was descended of a family once of some name in the county; but the indiscretion of his ancestors gradually wasted the property, and the early death of both parents left him at the age of thirteen penniless, homeless, and friendless. His godfather, on a claim of debt, took possession of their scanty effects, clogged with the charge of the orphan. From him Gifford received little kindness. He spent some time as cabin-boy on board a little coasting-vessel: at the age of fifteen he was apprenticed to a shoemaker at Ashburton. In spite of a neglected education, his talents showed themselves in a strong thirst for knowledge. Mathematics at first were his favourite study; and he relates that, in the want of paper, he used to hammer scraps of leather smooth, and work his problems on them with a blunt awl.

His master, finding his services worth nothing, used harsh means to wean him from his literary tastes; and Gifford, hating his business, sunk into a sort of savage melancholy. From this state he was withdrawn by the active kindness of Mr. Cookeley, a surgeon of Ashburton, who, having become acquainted with his first rude attempts at poetry, and with his sad story, conceived a strong regard for him, and taxed his own purse and interest so effectually as to raise the means of freeing him from his indentures, placing him at school, and sending him, after two well-spent years, to Exeter College, Oxford. He appears to have commenced residence about the age of twenty-two or twenty-three. Not long after he sustained a most severe affliction in the untimely death of Mr. Cookeley. But a more efficient and equally sincere friend was soon raised up in the person of Earl Grosvenor, who, in consequence of the casual perusal of a letter, became interested in Gifford's character and fortunes, gave him a home under his own roof, in or about the year 1782, and in great measure entrusted to him the charge of his son, with whom, though widely differing in politics, Gifford maintained through life an intimate and unvarying friendship. It appears that he did not remain long enough at Oxford to take a degree. Here ends the romantic part of his history; the rest of his life is simply the chronicle of his works.

The first of these, in order of publication, was the 'Baviad,' a paraphrastic imitation of the First Satire of Persius, 1791, a strong stern attack on what was called the Della Cruscan style of poetry, which for its utter folly and emptiness deserved no quarter. A short account of its rise is given in the preface to the 'Baviad,' which put an end to this affectation. Less successful, though not less powerful in execution, was the 'Mæviad,' a similar satire directed against the puerilities and extravagance of the modern drama. The peculiar talent displayed in these two pieces indicated the author's fitness to undertake a translation of Juvenal, a task which he had commenced even before his residence at Oxford, and had never altogether abandoned, though the untimely death of Mr. Cookeley, to whose care the revision of these early efforts was entrusted, had caused it to be laid aside for a time in disgust. The translation of Juvenal was published in 1802, with a short autobiography prefixed, which for its unaffected candour and manliness is worthy of all praise. The diction and versification of the translation are powerful and flowing; and the honest anger, the fearless crushing invective, the stinging sarcasm of the Latin poet, are rendered in so congenial a spirit as to convey to the English reader a satisfactory idea of the original. Some of his minor pieces are tender and beautiful, and indicate that he might have succeeded as a poet in a softer strain. He had paid much attention to old English poetry, the fruit of which appeared in his editions of Massinger, 4 vols. 8vo, 1805; Ben Jonson, 9 vols., 1816; Ford, 2 vols., 1827; and Shirley, 6 vols., 1833; the two last were posthumous. He is said to have meditated an edition of Shakspeare.

In that time of strife, Mr. Gifford entered with his whole heart into the views of the Antigallican party. He was a devoted admirer, and, in later years, an intimate friend of Mr. Pitt. In 1798 his known ability recommended him to the editor of the 'Antijacobin' [CANNING, GEORGE], a connection which introduced him to the most brilliant circles of political and literary men, such as Pitt, Canning, Lord Liverpool, the Marquis of Wellesley, Frere, George Ellis, and others. In 1809 he resumed the office of a political partisan upon a more extended scale, as editor of the 'Quarterly Review.' A great stock of knowledge, a powerful and ready pen, a strong talent unchecked by fear or pity for satire, a full undoubting belief in his political creed, fitted him admirably for his employment; and the success of the 'Review' was most brilliant. His salary was at first 200*l.*; it was gradually increased to 900*l.* per annum. He was a thorough-going political partisan, yet it is asserted that his political partisanship was disinterested, and that he very rarely either asked or received a favour from ministers. He was himself appointed first to the paymastership of the Band of Gentlemen Pensioners, and secondly to a commissionership of the lottery. He was generous in pecuniary matters, and in private life and conversation is reported to have been unassuming and courteous. He appears to have had the power of feeling and inspiring strong friendships. His gratitude to Mr. Cookeley was ardent, and ended only with his life; indeed he made one of that gentleman's family the principal inheritor of his fortune. During the latter years of his life he suffered greatly from asthma, and withdrew from general society. He gave up the editorship of the 'Quarterly Review' two years before his death, which took place on the 31st of December 1826, at his house in James-street, Buckingham Gate. An interesting account of his character and manners, from the pen of a personal friend, appeared soon after in the 'Literary Gazette.' From that and the autobiography prefixed to the Juvenal the facts of this account are taken.

GIL VICENTE, surnamed the Plautus of Portugal, was born about 1485, of an old and distinguished family. Following the wish of his parents he studied law, which however he soon abandoned for the stage. Having access at court by right of birth, he supplied several dramatic productions, adapted to different occasions, which were represented at the solemnities of the court. His plays were enacted at the court of King Emmanuel, and the first of them was performed in 1504. They had great success, which increased during the reign of Emmanuel's successor, John III., who often played a part in them himself. It appears that Gil Vicente acted himself in his dramas, and

it is certain that his daughter Paula (lady of honour to a royal princess) was the first dramatic performer of her time in Portugal, and equally distinguished as a poetess and a musician. Gil Vicente preceded by almost a century Lope de Vega and Shakspeare, and being then the only dramatic author of his time, gained a European reputation. Erasmus, who was probably informed of his fame by the Portuguese Jews who sought refuge in Holland, learned Portuguese in order to read his works.

Gil Vicente may be considered as the creator of the Spanish theatre, having written in the Castilian language his religious drama, which was performed in 1504, on the occasion of the birth of the prince, who was afterwards King John III., and which is anterior in date to all the dramatic productions of Spain. He is also the model that Lope de Vega and Calderon imitated, and on which they improved. His works however are full of the extravagancies which frequently disfigure the productions of Vega and Calderon, without possessing their beauties. These faults are however excusable in the works of one who, like himself, was creating a new kind of literature; and his poetry is distinguished by richness of invention, brilliancy of imagination, and great harmony of versification.

Gil Vicente's works were published by his son in 1562, at Lisbon, in one volume folio, and republished at the same place in 4to in 1586. The editor has divided the dramatic productions of his father into four classes, viz., 1st, the autos; 2nd, the comedies; 3rd, the tragi-comedies; and 4th, the farces. The autos, or religious plays, of which there are sixteen, were chiefly intended for the celebration of Christmas, and the shepherds perform in them a most important part. The comedies are the worst productions of Gil Vicente, and are, like those of Spain, nothing but dramatised novels, which embrace all the life of an individual, the events of which are ill-connected and devoid of plot and catastrophe. The tragi-comedies may be considered as rough sketches of the tragi-comedies which were afterwards written in Spain; they contain some touching scenes: none of them are founded on historical subjects. The farces, eleven in number, are the best part of Gil Vicente's productions, and may be regarded as specimens of the true comedy. They contain a great deal of merriment, and some well-drawn characters, but they are generally devoid of plot. It is remarkable that the plot, which is the soul of Spanish plays, is generally neglected in the Portuguese productions of a similar kind.

GILBERT, GABRIEL, lived in the 17th century, but the periods of his birth and death are alike unknown. His works are chiefly dramatic, and are sometimes referred to as specimens of badness; yet it is supposed that Racine has occasionally borrowed his thoughts, and clothed them in more elegant language. The fact of his having produced a tragedy called 'Rodogune,' in the year that Corneille brought out one with the same title, and the remarkable coincidence that the first four acts of both were nearly alike, occasioned a literary controversy as to whether Gilbert had committed a plagiarism or not. Queen Christina of Sweden entertained a high opinion of Gilbert's genius, and appointed him resident of the court of Stockholm in France. On her death he fell into poverty, when M. d'Hervart, a Mæcenas of the time, received him into his own house, where probably he died.

GILBERT, NICOLAS-JOSEPH-LAURENT, was born in 1751, at Fontenoi-le-Château in Lorraine. His parents, who were poor, nearly exhausted their trifling means in giving him an education. He went to Paris, and endeavoured to raise himself into notice by writing laudatory verses to great persons. This expedient failed, and he became, in consequence, tinged with misanthropy. He joined the anti-philosophic party of the times and wrote against the infidel philosophers a satire called 'Le Dix-huitième Siècle,' and another styled 'Mon Apologie,' as well as several odes and religious poems. He died, at the early age of twenty-nine, at the Hotel Dieu, whither he had been removed on account of insanity, his death being occasioned by a small key, which in one of his fits he swallowed. His satires are reckoned superior to his odes, but both are severely reprehended by La Harpe as well for the thoughts they embody as for their grammatical defects.

GILBERT, or GILBERD, WILLIAM, was born in 1540 at Colchester, Essex, of which borough his father was recorder. After passing through the grammar school of his native place, he proceeded to Cambridge, and thence, according to Anthony à Wood, to Oxford. Having decided on adopting medicine as a profession, he went to a foreign university to prosecute his medical studies, and whilst abroad received the degree of Doctor of Physic. He was elected a fellow of the College of Physicians, London, in 1573. As a physician, he attained great celebrity, and the eminence he had acquired by his scientific pursuits, both in England and on the Continent, appears to have rather assisted than hindered his professional progress. Queen Elizabeth appointed him her physician in ordinary, conferred on him many marks of her favour, and gave him an annual pension to encourage his studies. (Fuller, from the information "of his near kinsman, Mr. William Gilbert of Brental-Ely.")

His early scientific studies had been chiefly in chemistry; but eventually his attention was devoted principally to the subject of magnetism, and in 1600 he published his great work, on which he had been for eighteen years engaged—a folio volume of 240 pages, entitled

'De Magnete, Magneticisque corporibus, et de magno magnete tellure; physiologia nova, plurimis et argumentis et experimentis demonstrata.' In this work, after giving an account of all that had been previously written on the subject, he propounds his own views, which not only were full of novelty and of remarkable comprehensiveness, but in fact served as the basis of most subsequent investigations on the important subject of telluric magnetism, and forestalled many of the discoveries of comparatively recent experimenters and theorists. Whewell, indeed, in the last edition of his 'History of the Inductive Sciences,' vol. iii. p. 49, says that Gilbert's "work contains all the fundamental facts of the science, so fully examined, indeed, that even at this day we have little to add to them." He establishes as his fundamental principle the magnetic nature of the earth; demonstrates the affinity of magnetism and electricity, while he clearly distinguishes between them: and recognising electric action as the operation of a natural force or power allied to magnetism, he regards magnetism and electricity as two emanations of one fundamental force pervading all matter. He treats at length of the attraction, direction, and variation of the magnetic force. He pointed out too the cardinal fact on which all our generalisations rest—that the magnet has poles, which, he says, we may call north and south poles, and that in two magnets the north pole of each attracts the south pole and repels the north pole of the other. He proposed to determine latitudes by means of the inclination of the magnetic needle, and invented two instruments for the purpose; but he did not perceive that the method is not generally applicable. The work created a powerful impression at the time, especially among the learned in other parts of Europe. Galileo expressed the highest admiration of the work and its author, and Erasmus pronounced him to be "great to a degree that is enviable." In his own country he was scarcely so highly appreciated; even Bacon, though he praises Gilbert as a philosopher, speaks with little respect of his theory. After awhile his speculations came to be more esteemed, though perhaps not fully understood; but the great superiority of Gilbert over all who had previously treated of magnetism, and "the extent to which he had anticipated by his conjectures much of our present knowledge," has only been perceived since the study of magnetism has assumed something like its present systematic and comprehensive character. "William Gilbert," says Humboldt, "regarded the earth itself as a magnet, and the lines of equal declination and inclination as having their inflections determined by distribution of mass, or by the form of continents and the extent of the deep intervening oceanic basins. It is difficult to reconcile the periodic variation which characterises the three elementary forms of the magnetic phenomena (the isoclinical, isogonic, and isodynamic lines) with this rigid distribution of force and mass, unless we imagine the attractive force of the material particles modified by similar periodical variations in the interior of the globe. In Gilbert's theory, as in gravitation, the quantity of material particles only is estimated, without regard to the specific heterogeneity of substances. This circumstance gave to his work, in the period of Galileo and Kepler, a character of cosmical grandeur. By the unexpected discovery of 'rotation magnetism' by Arago (1825), it has been practically proved that all kinds of matter are susceptible of magnetism; and Faraday's researches on diamagnetic substances have, under particular conditions of 'axial or equatorial direction,' and of solid, fluid, or gaseous inactive conditions of the bodies, confirmed this important result. Gilbert had so clear an idea of the imparting of the telluric magnetic force, that he already ascribed the magnetic state of iron bars in the crosses on old church towers or steeples to this circumstance." ('Kosmos,' ii. 332, Sabine's translation.) It is deserving of remark that Gilbert, in this work, was the first to use the terms "electric force," "electric emanations," and "electric attraction;" also to point out that amber was not the only substance which had the faculty, when rubbed, of attracting light objects of any kind, but that it was common to all the resins, to sealing-wax, sulphur, glass, rock-crystal, the precious stones, &c.; and he describes how, by means of an iron needle moving freely on a point, to measure the excited electricity.

After the death of Elizabeth, Gilbert was continued in his office of physician in ordinary by James, but he survived his royal mistress only a few months. He died on the 30th of November 1603, and was buried in the church of the parish in which he was born, Trinity's, Colchester. Gilbert was never married, and he bequeathed his books, philosophical instruments, globes, and collection of minerals to the College of Physicians. Gilbert left in manuscript another treatise, which was not printed till forty-eight years after his death: 'De Mundo nostro sublunari Philosophia Nova,' 4to, Amsterdam, 1651.

GILDAS (surnamed Sapiens, or 'the wise'), if the period when he is said to have flourished—the first half of the 6th century—be correct, the most ancient British historian now extant, according to Leland, was born in Wales, but according to the received account at Alcluyd (Dumbarton), where the Britons still held a limited sway, towards the close of the 5th or beginning of the 6th century: Leland says in 511, other accounts in 493. He was early noted for his piety and learning, and to improve himself in the latter went to France, where he remained seven years. On his return he established a school and church on the coast of Pembrokehire, to which scholars flocked from all parts of the country, and on Sundays crowds of devout persons to hear him preach. Invited to Ireland by St. Brigit, who had heard the fame of

his piety, he went to that country, was received with the greatest joy by the king, restored the church there which had become very corrupt to its pristine purity, performed many miracles, and founded many monasteries. He then returned to England, and thence proceeded to Rome; and on his return, through Brittany, founded the monastery, afterwards famous, of St. Gildas de Ruys, where he resided some time, and there he ended his days, according to a tradition preserved by the monks of that establishment; but, according to the account given by English writers, he returned to this country, and spent the remainder of his life in religious retirement: his last days being passed in an oratory he had built for himself in the neighbourhood of Glastonbury. Archbishop Usher ('Primord.,' p. 477, from the 'Annals of Ulster') has fixed his death in the year 570; but this account, as will have been seen, is at least to a great extent legendary. In truth, as Mr. Stevenson observes in his introduction to the Latin text of 'Gildas de Excidio Britannie,' "We are unable to speak with certainty as to the parentage of Gildas, his country, or even his name, the period when he lived, or the works of which he was the author." Mr. T. Wright attempts to show that Gildas is a fabulous person, and his history the forgery of "some Anglo-Saxon or foreign priest of the 7th century." ('Biog. Brit. Lit.,' Anglo-Saxon Period, pp. 115-134.) But Stevenson, Lappenberg, and others, while admitting the fabulous character of the common accounts, are inclined to believe that Gildas really lived somewhere near the time usually stated. The epistle, or treatise, 'De Calamitate, Excidio, et Conquestu Britannie,' is all that is printed of his writings, and is probably all of his that is extant, though Bale and Pits make him author of several other books. It was first published and dedicated to Cuthbert Tonstal, bishop of London, by Polydore Virgil, whose imperfect and corrupt text was reprinted at Paris in the 'Bibliotheca Patrum' in 1610. The second edition of this work was published in the 'Opus Historiarum nostro Saeculo convenientissimum,' pp. 484-540, at Basel, 8vo, 1541; again, in a separate form, 12mo, Lond., 1568; Basel, in the same year; and Paris, 1576; and from a better manuscript than was used in any previous edition by Gale, in his 'Rerum Anglicarum Scriptores Veteres,' 3 vols. fol., 1684-87; but the best edition is that published in 1838 by the Historical Society, and admirably edited by Mr. Joseph Stevenson. There are three English translations of it: one by Thomas Habington, 8vo, London, 1638; another entitled 'A Description of the State of Great Britain, written eleven hundred yeares since,' 12mo, London, 1652; and a third, by Dr. Giles, but based on that of Habington, and published in Bohn's 'Antiquarian Library,' 1848.

There were two other persons of the name of Gildas in the 6th century, one called Gildas Cambrius, the other Gildas Quartus, both of whom seem to have been one and the same with Gildas Sapiens.

GILL, JOHN, D.D., an eminent Baptist minister, was born at Kettering, in Northamptonshire, on the 23rd of November (old style) 1697. His parents, though in humble life, gave him a superior education in the grammar-school of his native town, until the enforcing of a rule which required attendance upon episcopal worship occasioned his withdrawal, in common with other children of dissenters. He continued his studies in private, and attained considerable proficiency in the Greek, Latin, and Hebrew languages. About the age of twenty he began to preach at Higham Ferrars among the denomination to which both he and his parents belonged, and in 1719 he removed to London, to take charge of a congregation which then assembled at Horsleydown, Southwark; but removed in 1757 to a new chapel in Carter-lane, near London Bridge, over which he presided until his death, on the 14th of October 1771, a period of more than half a century. Of his numerous publications, which are said to have been equal to 10,000 folio pages, many were of a controversial character and of temporary interest. That by which he is best known is his 'Exposition of the Bible,' published at various times in distinct portions. The 'Exposition of the Song of Solomon' appeared in a folio volume in 1728, and was republished with corrections and additions in 1751 and 1767. In this work Gill replies to Whiston's endeavours to prove the 'Song of Solomon' to be a spurious book. The 'Exposition of the New Testament' appeared in three folio volumes in 1746, 1747, and 1748, in which last year the degree of D.D. was conferred upon the author from Marischal College, Aberdeen. The Old Testament was completed at various times in six folio volumes, and a second edition of the whole was published shortly before his death. A third complete edition of the 'Exposition' was published in 1809 and 1810 in nine large quarto volumes, with a very copious memoir of the life and writings of Dr. Gill, from which the above facts are derived. Among his other works we may mention 'The Prophecies of the Old Testament respecting the Messiah considered, and proved to be literally fulfilled in Jesus,' published in 1728, in answer to Collins's 'Scheme of Literal Prophecy considered,' a 'Treatise on the Doctrine of the Trinity,' published in 1731, and intended to check a then growing tendency to Sabellianism among the Baptists; the 'Cause of God and Truth,' in 4 vols. 8vo, published in 1735 and following years, being a defence of Calvinistic against Arminian sentiments, in which Gill displayed a strong inclination to Supralapsarianism; a 'Dissertation concerning the Antiquities of the Hebrew Language, Letters, Vowel-Points, and Accents,' 1767, 8vo; and a 'Body of Doctrinal Divinity,' 2 vols. 4to, 1769, and 'Body of Practical Divinity,' 1 vol. 4to, 1770,

which were republished together in 1795 in 3 vols. large 8vo as 'A Complete Body of Doctrinal and Practical Divinity,' with a portrait of Dr. Gill.

GILLIES, JOHN, LL.D., was born on the 18th of January 1747 at Brechin, in the county of Forfar, Scotland. He belonged to a respectable and enterprising family. One of his younger brothers became eminent as a lawyer, and was for many years a judge of the Supreme Court in Scotland. Dr. Gillies was educated at the University of Glasgow, where, before he was of age, he taught the classes of the Greek professor, then old and infirm. Soon after this he removed to London, with the design of occupying himself in literary labour; but before settling there he paid a visit to the continent, and on his return he was engaged by the Earl of Hopetoun as travelling tutor to his second son. This young man, while under his care, died at Lyon in 1776; and his tutor's attention to him was rewarded by an annuity for life from his father.

In 1778 Dr. Gillies published his translation of Lysias and Isocrates. He had by that time received his degree as Doctor of Laws; and to this in later life he added other literary honours, being a member of several societies in our own country, and a corresponding member of the French Institute and the Royal Society of Göttingen. He next went abroad again with two other sons of the Earl of Hopetoun. Returning to England about 1784, Dr. Gillies published in 1786 the first part of his 'History of Ancient Greece.' In 1793 he was appointed to succeed Dr. Robertson as Historiographer Royal for Scotland, a sinecure place with a salary of 200*l.* a year. In 1794 he married. Enjoying a moderate competency, he prosecuted his studies with leisure; and his subsequent writings appeared at long intervals. During his latest years he was very infirm, though labouring under no disease, and had retired altogether from general society. In 1830 he settled at Clapham, near London, where he spent the remainder of his quiet old age; and died on the 15th of February 1836 of mere decay, having just entered his ninetieth year.

The following are his published works:—1. 'The Orations of Lysias and Isocrates, translated from the Greek, with some Account of their Lives; and a Discourse on the History, Manners, and Character of the Greeks, from the Conclusion of the Peloponnesian War to the Battle of Chæronea,' 1778, 4to. 2. 'The History of Ancient Greece, its Colonies and Conquests' (afterwards entitled Part the First), 'from the Earliest Accounts till the Division of the Macedonian Empire in the East; including the History of Literature, Philosophy, and the Fine Arts,' 1786, 2 vols. 4to. This work had reached a sixth edition in 1820, 4 vols. 8vo. There is a German translation of it, 'Geschichte von Altgriechenland,' 11 vols. 12mo, Vienna, 1825. 3. 'View of the Reign of Frederick II. of Prussia, with a Parallel between that Prince and Philip II. of Macedon,' 1789, 8vo. 4. 'Aristotle's Ethics and Politics, comprising his Practical Philosophy, translated from the Greek; illustrated by Introductions and Notes, the Critical History of his Life, and a New Analysis of his Speculative Works,' 1797, 2 vols. 4to. The 'Supplement to the Analysis of Aristotle's Speculative Works, containing an Account of the Interpreters and Corruptors of Aristotle's Philosophy, in connection with the Times in which they respectively flourished,' 1804, 4to, was incorporated also in a second edition of the translation published in the same year, 2 vols. 8vo. 5. 'The History of the Ancient World, from the Dominion of Alexander to that of Augustus, with a Preliminary Survey of Preceding Periods,' 1807-10, 2 vols. 4to; reprinted in 4 vols. 8vo as 'The History of Ancient Greece, its Colonies and Conquests, Part the Second,' 1810. 6. 'A New Translation of Aristotle's Rhetoric, with an Introduction and Appendix explaining its Relation to his Exact Philosophy, and vindicating that Philosophy by proofs that all Departures from it have been Deviations into Error,' 1823, 8vo.

The first part of the 'History of Greece' appeared in the same year with the first volume of Mitford's work, and, if inferior to it, is yet superior to anything of the sort which our language till then possessed. The plan is well digested; but the pompous verbosity of its narrative, and the general dullness of its dissertative portions, perhaps prevent it recovering its popularity, if newer views and wider and deeper research had not rendered it otherwise of little value. The translations of Dr. Gillies, however meritorious their intention, do not deserve high praise. They are everywhere at the very least paraphrastic, and in many places reprehensibly unfaithful. Those from the orators are the least faulty; and for Isocrates the translator's style, elaborate, diffuse, and thoroughly modern in its structure, was not on the whole ill calculated. But to Aristotle's works his mode of treatment does great injustice. His desire of popularizing his author has made him depart almost always from his manner of expression; and the same motive, aided not unfrequently either by mistake as to his nomenclature or by the wish to evade a difficulty in the text, has made him often misrepresent even the matter which the philosopher gave him. The 'Ethics and Politics' indeed he can scarcely be said to have translated at all, so much do his professed translations abound in inaccuracies, in omissions, and in unauthorised interpolations.

GILLRAY, JAMES, the celebrated caricaturist, was born about the middle of the last century. He was originally a writing engraver, and is said also to have been a strolling player for a short time. He had an acute perception of character, a strong sense of the ludicrous, and at the same time a great ability for drawing, and a practical skill in

engraving. His great faculty was the burlesque; his works however often contain much wholesome satire. Social abuses and absurd conventionalisms were often the subject of his ridicule; but his pencil was more frequently directed against political abuses; the doings and enactments of the Tory ministries and the events of the great war were his favourite themes. His first political satire was published in 1782, and in allusion to Fox and Lord Rodney's victory. The last of his caricatures appeared in 1809: it represented 'a barber's shop in assize-time,' and was from a design by H. W. Bunbury, who designed several other of the caricatures which were engraved by Gillray. This last plate was executed at intervals between fits of mental aberration, which terminated shortly afterwards in a total suspension of the intellectual faculties, in which state he remained until his death on the 1st of June 1815. His works appeared singly; but they have been published in sets, genuine, and spurious or copies. An 'Illustrative Description,' with a complete set of his genuine works in 304 sheets, was published by McLean, London, in 1830. Many of them exceed the bounds of the burlesque, and are far in the province of the gross and absurd; he also frequently took great personal liberties. Gillray's caricatures, to be thoroughly understood, require a familiarity with the party history of the time; they are mostly mere works of the day.

GILPIN, BERNARD, is one of those persons who, without having been placed in stations which afforded the opportunity for the display of extraordinary intellectual powers, or having had the course of their lives marked by very unusual and extraordinary incidents, yet occupy no inconsiderable space in the eye of their countrymen, and are regarded with affection and respect, as ornaments of their time and an honour to the nation to which they belong. This is owing in part to the popular character of his virtues, and in part to his having had in Bishop Carleton a contemporary biographer, who has given a pleasing and no doubt faithful account of his life and manners. In later times, one of his own family, the Rev. William Gilpin, of Boldre (of whom in a following article), prepared a larger and no less interesting account of this venerable character.

Bernard Gilpin was born at Kentmire, Westmoreland, in 1517, of a genteel family; was entered on the foundation of Queen's College, Oxford, in 1533; became distinguished in the schools, and acquired an unusual knowledge of Greek and Hebrew; in March 1541 proceeded M.A., and was elected fellow of his college. So high did he stand as a scholar at Oxford, that he was selected as one of the first masters on the foundation of Christchurch College by Henry VIII. He had in opening manhood been a warm adherent of the papacy, but early became a convert to Protestantism, in which he never subsequently wavered. Having taken holy orders, he in 1552 received the gift of the vicarage of Norton, in the diocese of Durham, and preached a sermon at Greenwich before Edward VI. Early in the reign of Queen Mary he resigned his living, and went abroad, as did many others who had been favourers of the Reformation in the days of King Edward. He was absent three years. He ventured to return while Queen Mary was alive; and was cordially received by Tunstall, who was related to him on his mother's side, and who made him archdeacon of Durham and rector of Houghton-le-Spring. His preaching at this period was remarkably bold. He inveighed against popular vices in the spirit of an enthusiastic reformer; and when this brought upon him much odium from persons who were touched by him, and he was accused to the Bishop of Durham, the bishop protected him so effectually, that his accusers brought their charges before the notorious Bonner, bishop of London. This led to a remarkable incident. Gilpin obeyed the summons of this unpitying prelate. Full of the expectation of nothing less than to suffer at the stake, "Give me," said he, before he set out, to his house-steward, "a long garment, that I may die with decency." As he journeyed with the ministers of the bishop, an accident happened to him which occasioned a delay. It is said that his leg was broken. While he lay without the possibility of proceeding, intelligence came that the queen was dead. Gilpin returned in peace to his parishioners at Houghton.

The only other incident in his life which requires notice is, that the bishopric of Carlisle was offered to him by Queen Elizabeth. This offer he declined, and continued to his death the rector of Houghton, residing constantly in his parish, except when he visited the ruder parts of the county of Northumberland, into which he appears to have introduced more of regular habits of life and more of Christian influences than had resulted from the labours of any previous Christian instructor who had lived amongst them.

The parts of Redesdale and Tynedale, debateable land on the Marches, are particularly named as the scenes of his labours. The people there, living on the borders of the two countries, had long led a lawless life, subsisting mostly on plunder. Gilpin went fearlessly amongst them, holding forth the commands and the sanctions of Christianity, and did much to change the character of the country. Hence it was that he was commonly called the Northern Apostle, and his name for generations was repeated with reverence.

His own parish of Houghton, which included within it fourteen villages, however was the chief scene of his labours. It yielded him an ample income, for Houghton was then, as now, one of the richest benefices in the north. He was himself a bachelor. In hospitality

he was like what is said or fabled of the primitive bishops. Every fortnight, we are told, forty bushels of corn, twenty bushels of malt and a whole ox, were consumed in his house, besides ample supplies of provisions of many other kinds. A good portion of this hospitable provision was no doubt consumed by his parishioners, it being his custom, having "a large and wide parish and a great multitude of people, to keep a table for them every Sunday from Michaelmas to Easter." But the rectory-house was also open to all travellers, and so great was the reverence which surrounded the master, that his liberality was rarely abused; even the most wicked being awed by it.

His skill in according differences was scarcely less famed than his hospitality and his preaching; and when to this we add that his benevolence took the wise direction of providing instruction for the young, and that he was assiduous in his attention to the sick and to the poor, we have touched upon all the points which can be prominent in the life of a good pastor. His zeal for education was manifested at once in the education of the poor children in his parish in homely learning, and in patronising promising youth in their studies in the universities. Of these, his scholars, "he kept full four-and-twenty in his own house, the greater number being poor men's sons, upon whom he bestowed meat, drink, and cloth, and education in learning;" and out of these scholars, and from the grammar-school which he founded, we are told that "he supplied the Church of England with great store of learned men." Of his scholars he always maintained at his own expense at least six at the universities, and when they had completed their studies charged himself with the care of their settlement. Bishop Carleton, who wrote his life, was one of these scholars. Bernard Gilpin was sometimes called the Father of the Poor, as well as the Apostle of the North.

GILPIN, SAWREY, R.A., was born at Carlisle in 1733, and was a brother of the Rev. William Gilpin, the subject of the following article. From his father, a military officer, he learnt to draw with readiness and skill, and early evinced the wish to become a painter. He was placed with Mr. Scott, then a noted marine painter in London; but his own inclination led him to paint animals, and especially horses; and some of his pictures having been shown to the Duke of Cumberland, a great patron of horse-racing, the duke employed him to paint the portraits of his favourite horses. Gilpin soon found abundant employment of a similar kind, and became the recognised head of that branch of art in England. Well acquainted with animal anatomy, his animals are almost always correctly as well as boldly drawn, and their positions are true as well as free. Though best known as a painter of horses, some of his pictures of tigers and other wild animals were thought to be of superior merit; but he was deficient as a colourist and in other of the higher technical qualities. As an artist, consequently, Sawrey Gilpin does not take any elevated rank, though he made several attempts in the more ambitious walk of historical art; but, as a vigorous and spirited painter of portraits of horses, he far excelled any of his contemporaries or immediate predecessors, and has not been greatly excelled by more recent animal painters. He died March 8, 1807. The etchings of animals in his brother's works were executed by Sawrey Gilpin.

GILPIN, REV. WILLIAM, was born in 1724. Having taken orders, he lived for some time on a curacy in the north, among his relations; but having only a small fortune, and marrying a young lady, his cousin, whose fortune also was small, and having but little hope of patronage in the church, he removed into the neighbourhood of London, and took a school at Cheam, in Surrey, which he conducted skilfully and successfully for many years. Some of his pupils acquired distinction, among them were Viscount Sidmouth, Lord Bexley, and Mitford, the author of the 'History of Greece.'

Mr. Gilpin is said, by the friend who has drawn a very pleasing picture of his life and manners, to have resolved to retire from the duties of a schoolmaster whenever he had realised 10,000*l.*; and having at length succeeded in this, it fortunately happened for him that about the same time his former pupil, Colonel Mitford, presented him to the living of Boldre, on the borders of the New Forest, Hampshire. To this village Mr. Gilpin retired, and there he spent the remainder of his life, scarcely ever leaving it, in the active discharge of the duties of a village pastor, and being, like his venerable ancestor, a blessing to the place. He died at Boldre, April 5, 1804.

Mr. Gilpin however is not to be regarded only in his private character of a good schoolmaster and an excellent parish pastor; he has enriched the literature of his country with several valuable writings in various departments. His first work was a 'Life of Bernard Gilpin,' and it was soon succeeded by a 'Life of Latimer,' who bore some resemblance to Gilpin. At a later period of life he published lives of Cramer, Wicliff, Huss, Jerome of Prague, and Zisca. He was the author also of a body of 'Lectures on the Church Catechism,' an 'Exposition on the New Testament,' a 'Treatise on the Amusements of Clergymen,' and 'Sermons for Country Congregations.' These works are all written in a style of simplicity which is singularly engaging.

But Mr. Gilpin was a person of a remarkably refined taste, as is evinced by writings of his of a class entirely distinct from those we have enumerated. These are his volumes in which he has illustrated, both by his pencil and his pen, the picturesque beauty of

some parts of England, and, generally, the principles of beauty in landscape. The first of these works was published in 1790, in two volumes, 8vo; it was entitled 'Observations relative chiefly to Picturesque Beauty, made in the year 1776, in several parts of Great Britain, particularly the Highlands of Scotland.' This was followed by two other volumes of the same character, the greater part of them relating to the lake country of Cumberland and Westmoreland. Two volumes more, on 'Forest Scenery,' succeeded. Besides these, there are his 'Essays on Picturesque Beauty;' 'Picturesque Travels and the Art of Sketching Landscapes;' 'Observations on the River Wye;' 'Picturesque Remarks on the Western parts of England,' and an 'Essay on Prints.' These form a body of works which were well received by the public at the times of their appearance, and which are now gathered into the libraries of the tasteful and the curious. Some 'Observations on the Coasts of Hampshire, Sussex, and Kent,' were published after his decease.

For the principal part of this article we have been indebted to a memoir on his life, with extracts from his correspondence, inserted in a periodical work published at Bath, and intitled 'The Omnium Gatherum.' The writer is understood to be the Rev. Richard Warner, who was sometime curate to Mr. Gilpin.

GINGUENÉ, PIERRE-LOUIS, born at Rennes in Brittany, in 1748, early applied himself to the study of literature and of foreign languages. Having removed to Paris he made himself known by several works, especially by his poem on the death of the young Prince Leopold of Brunswick, who was drowned in the Oder whilst trying to save some poor people who were in danger of perishing in the flood. In his 'Lettres sur les Confessions de J. J. Rousseau,' he undertook to defend the memory of that highly-gifted but wayward man. When the Revolution broke out, Ginguené embraced its cause, but did not advocate its excesses; he wrote in several journals of the time, and edited the 'Decade Philosophique Littéraire et Politique,' from 1794 to 1807. On being made a member of the Institute, he was placed at the head of the department of public instruction. He was afterwards sent by the Directory in 1798 as ambassador to the king of Sardinia, where he had a most difficult task to perform, that of reconciling his conscience, naturally honest and candid, with the crooked and ungenerous policy of his masters towards a forced ally, whom they tried to vex and insult in every possible manner, with the view of seizing a favourable opportunity to dethrone him. Botta, who knew and esteemed Ginguené, gives in his 'History of Italy' a full account of the disgraceful and calamitous scenes that took place in Piedmont at the time. Ginguené seems to have felt the unpleasantness of his position, for after seven months he resigned his embassy and returned to Paris, where he had a seat in the legislative body. After Bonaparte became first consul in 1799, Ginguené was chosen member of the tribunate, but owing to his opposition to the encroachments of the executive he was one of those who were ejected by a *Senatus Consultum* in 1802. He withdrew into private life, and applied himself chiefly to the composition of a work which he made the business of the remainder of his life—the 'Histoire Littéraire d'Italie,' 9 vols. 8vo, 1811-19.

He had always been very partial to Italian literature, and perceiving that his countrymen had no accurate notion of its riches, and had imbibed several vulgar prejudices against it, he undertook the arduous task of classing the numerous productions of Italy under each respective department of literature and according to the order of time, thus presenting the reader with so many sketches of the intellectual state of Italy in each century. His history begins, properly speaking, with the 13th century, when the first lays of the Italian muse began to be heard. In the first three volumes he follows the progress of literature through the 13th, 14th, and 15th centuries, after which he devotes six more volumes to the 16th century, the Augustan age of modern Italy. He died at Paris, in November 1816, without completing his work, which has since been continued by Salfi to the close of the 17th century. It is an important and useful work, and in some respects preferable, because more critical and more freely written, to Tiraboschi's more ample and classical work, 'Storia della Letteratura Italiana,' from which Ginguené borrowed largely. Ginguené writes impartially, and as accurately as could be expected from a foreigner who had not lived in Italy, except during the seven stormy months which he spent at Turin, merely on the threshold of that country. His minuteness is sometimes fatiguing, and his style rather tame for the subject. The Italians have felt grateful to him for the honour which he has done to their great men, but have observed that he has been lavish of praise to many writers who are utterly forgotten in their own country. (Ugoni, Preface to the 'Storia della Letteratura Italiana'.)

Ginguené wrote also many articles for the 'Biographie Universelle,' and was a contributor to the 'Histoire Littéraire de France,' and other compilations. Salfi gives at the end of the first volume of his continuation, which is numbered the tenth of the 'Histoire Littéraire d'Italie,' an 'Eloge' of Ginguené.

GINKELL, GODART DE, FIRST EARL OF ATHLONE, was a native of Holland, and the head of a family of great antiquity among the nobility of that country, where he bore the titles of Baron de Reede, de Ginkell, &c., and was a general of cavalry. He came to England with the Prince of Orange, at the time of the revolution of

1688. When two Scotch regiments, in the beginning of March 1689, declared for King James, and marched from Abingdon, where they were quartered, for Scotland, General Ginkell was sent after them with a body of horse, and soon overtook and reduced them. In 1690 he accompanied King William to Ireland, and commanded a party of Dutch horse at the battle of the Boyne (July 1st). When the king returned to England, the conduct of the war was left in the hands of Ginkell; and he succeeded in effecting the reduction of the country before the end of the following year. The town of Baltimore surrendered to him on the 7th of June 1691; Athlone was taken by storm on the 1st of July; on the 12th of the same month he gained the battle of Aughrim; and on the 3rd of October an end was put to the war by the surrender of Limerick. On the 3rd of November Ginkell returned to Dublin, and was banqueted by the corporation; he then came over to England, where, on the 4th of January 1692, the Commons ordered seven of their members to attend him with the thanks of the House, and on the 20th of February he was made a peer of Ireland, with the titles of Earl of Athlone and Baron of Aughrim. The next week he was entertained at Merchant Taylors' Hall by the lord mayor and corporation of London. The following year the king, after the House of Commons had sent up an address requesting that a recompense might be given to him suitable to his services, made him a grant of the forfeited estates of the Earl of Limerick, amounting to 26,480 acres, which was confirmed by an act of the Irish parliament passed on the 7th of December 1695; but in 1699 an English act was passed appointing a commission to inquire into the considerations upon which this and other similar grants had been made in Ireland; in the next session by another act all the lands so granted were vested in trustees authorised to hear and determine upon all claims relating to them; and one of the acts of this board appears to have been the resumption or invalidation of the grant made to the Earl of Athlone. It is said that thereupon the family retired to Holland; the Earl of Athlone however continued his military services to the end of the reign of King William. He shared in William's defeat at Landen on the 29th of July 1693; and he commanded the Dutch horse in Flanders in 1695 and 1696. He also commanded the Dutch forces serving under Marlborough in the war with France which broke out in 1702, after the accession of Queen Anne. But this post he did not hold long, his death having taken place on the 10th of February 1703. The Peerages state that the first earl of Athlone married Ursula-Philippa de Raasfeldt, and had by her two sons, of whom the eldest succeeded to the title. It afterwards however fell to the son of the second, who succeeded as the fifth earl in 1747; and his descendants inherited the title till the death of the ninth earl, without issue, in 1844, when it became extinct. It is remarkable that, with the exception of the first earl, if he ever took his seat, no earl of Athlone sat in the Irish parliament for more than a century after the creation of the peerage. The family continued to reside in Holland; but Frederick Christian Renaud, the sixth earl, came over here on the French invasion of that country in 1795, and took his seat in the Irish House of Lords on the 10th of March in that year.

GIOBERTI, VINCENZO, was born on the 5th of April 1801, in the city of Torino (Turin), the capital of the kingdom of Sardinia. He studied with a view to the ecclesiastical profession, and having completed his education in the University of Turin, received the degree of Doctor of Theology, and became one of the teachers in the theological college. Soon after the accession in 1831 of Charles-Albert to the throne of Sardinia, Gioberti was appointed chaplain to the court, and continued to perform the duties of this office till 1833, when, on some accusation or suspicion of being implicated in the political agitations then prevailing in various parts of Italy, he was suddenly seized in the apartments which he occupied in the palace, and imprisoned in the citadel. There he was detained some weeks, but was at length set at liberty on the condition that he quitted the country as an exile. He went to Paris, where he resided till the end of 1834, when he removed to Brussels, having accepted the offer of a situation as teacher in one of the public schools of that city.

Gioberti wrote at Brussels, during his long abode there as an exile, nearly all those works which not only extended his literary reputation throughout the whole of Europe, but produced that enthusiasm of admiration which was displayed by the Italians after his return to his native country. The first of these works was the 'Teoria del Sovranaturale, ossia Discorso sulle Convenienze della Religione Rivelata colla Mente Umana e col Progresso Civile delle Nazioni,' 8vo, 1837. His next work was the 'Introduzione allo Studio della Filosofia,' 8vo, 1840, which was followed by the 'Lettere intorno agli Errori Filosofici di Antonio Rosmini,' 3 vols. 8vo, 1841-42; and the two treatises 'Del Bello,' 8vo, 1841, and 'Del Buono,' 8vo, 1843. His 'Primo Morale e Civile degli Italiani,' 8vo, 1848, was read with eagerness in every part of Italy, and excited expectations of the regeneration of that unfortunate country which, with the sole exception of the Sardinian kingdom, have not hitherto been realised. There was to be a confederation of the Italian states, in which the kings and princes, the pope and the priests, the citizens, and even the monks and Jesuits, were all to bear a part. The states were to be reformed, and popular rights and privileges gradually established. The pope was to be the religious head of the confederation, and Rome the capital city; the King of Sardinia was to be the military chief, and Turin the grand citadel.

The Jesuits alone were dissatisfied, and Gioberti attacked them in his 'Prolegomeni,' 8vo, 1845. Pius IX., on his accession to the papal chair in 1846, adopted the views of Gioberti, and began to carry out the reforms recommended in 'Il Primato;' and as the opposition of the Jesuits still continued, Gioberti produced his great attack on their principles and practice, under the title of 'Il Gesuita Moderno,' 5 vols. 8vo, Lausanne, 1847.

When the French revolution of February 1848 occurred, Gioberti was at Paris occupied with his plans for the renovation of Italy. On the 25th of April he quitted Paris, after an exile of fifteen years, to return to his native city of Turin, where his arrival was welcomed by a display of banners by day, and illuminations and fireworks at night, accompanied with music and dancing and patriotic songs; and afterwards, when he passed through Milan, Genoa, Florence, Rome, and other places, he was everywhere received with the greatest enthusiasm, so that his journey resembled a triumphal procession. On his return to Turin he was elected a member of the chamber of deputies, of which he was unanimously chosen president. He was opposed to all violent reforms, but the tide of political excitement in the year 1848 threw him into the ranks of the opposition, and on the 16th of December the king appointed him the prime minister of a democratic cabinet. He soon found himself to be in a false position, and the differences of opinion between himself and his colleagues led to a dissolution of the ministry on the 18th of February 1849. He was succeeded by Pinelli, and soon afterwards was sent to Paris to solicit aid from the French government in the approaching contest with Austria. His mission was of no avail. Milan was reconquered by Radetzky, Charles-Albert defeated at Novara, and Victor-Emmanuel II. has alone, of all the rulers of Italy, preserved for his subjects a constitutional government, a free press, and a just administration of the laws. Gioberti remained in Paris, and the fruit of his renewed studies was his work 'Del Rinnovamento Civile d'Italia,' 2 vols. 8vo, 1851. He died October 26, 1852, at Paris.

GIOCONDO, FRA GIOVANNI, an Italian architect of Verona, was born about the middle of the 15th century. He was celebrated for his almost universal acquirements, was a Greek and Latin scholar, a theologian, philosopher, and engineer, and was skilled in perspective and in decoration, especially in in-laid wood-work. He is mentioned in the highest terms by many contemporary writers, and particularly by his countryman Julius Cæsar Scaliger, who was his pupil in the Greek and Latin languages. Giocondo served the Emperor Maximilian in Germany, Louis XII. in France, and Leo X. at Rome: he built the Ponte della Pietra at Verona, that of Notre-Dame at Paris, and succeeded Bramante as architect of St. Peter's, the foundations of which he much improved. Vasari mentions other of his architectural works; he also says that he built two bridges over the Seine. He turned a great portion of the waters of the Brenta from the Venetian lagoons, directing them to Brontolo, many miles to the south of Venice, by which means the Venetian waters were kept perfectly free from the vast quantities of mud brought down from the Alps by the Brenta; this Vasari terms Giocondo's greatest work, and a signal service for Venice: the same or a similar channel still exists, and is called the Brenta Nuovissima. Amongst Giocondo's literary services Vasari mentions a great collection of ancient inscriptions which he copied in Rome and presented to Lorenzo de' Medici: he also first discovered several of the letters of the younger Pliny in an old library at Paris; and he published an illustrated edition of 'Vitruvius' at Venice in 1511.

In the continuation of St. Peter's, Giocondo was appointed conjointly with Giuliano da San Gallo and Raffaele, and the latter speaks of Giocondo in the following terms in a letter (published by Richardson, and inserted in recent Lives of Raffaele) to his uncle, dated July 1, 1514:—"He (the pope) has given me a companion, a very learned old friar, who is upwards of eighty years of age; and as the pope sees that he cannot live long, and as he has the reputation of great knowledge, his holiness has given him to me as an assistant, that I may learn of him, and discover any great secret he may have in architecture, and thus perfect myself in the art. He is called Fra Giocondo." According to this, if Raffaele was a correct judge of age, or had ascertained the fact of Giocondo's age, he must have been born about 1430, twenty years earlier than the date given by Vasari. Singularly enough, though not with unusual inconsistency, Vasari, in mentioning Giocondo incidentally in the 'Life of Raffaele,' says that he died in 1537, aged eighty-seven, yet in Giocondo's own life, which follows soon afterwards, he says, "He died at length very old; but it is not known exactly when or where." It is not known with certainty to what religious order he belonged, but he is supposed to have been a Franciscan. He was living in 1521.

(Vasari, *Vite de' Pittori*, &c.; Dal Pozzo, *Vite de' Pittori*, &c., *Veronesi*; Milizia, *Opere*; Quatremere de Quincy, *Dictionnaire d'Architecture*, &c.)

GIOFFREDO, MARIO GAETANO, one of the few good architects that Naples has produced, was born in that city, May 14, 1718. Greatly to the dissatisfaction of his parents, who intended him for the law, Gioffredo determined that architecture should be his pursuit; and he was accordingly placed under Martino Buonocore, an architect of considerable reputation, but of little talent. The pupil was not long in finding out the mediocrity of his master, and commenced a

course of private self-instruction by studying the best Neapolitan edifices, those by Fansaga and Domenico Fontana, and the writings of Vitruvius and Palladio. He further extended his studies not only to mathematics, but to antiquities and history in their connection with art, and also took lessons in design and figure-composition.

Gioffredo at the age of twenty-three began to practise in his profession, but for some time found no opportunity to distinguish himself. On one of his visits to Rome he solicited permission to compete for the church of San Giacomo degli Spagnuoli, then about to be rebuilt there: his application was very coldly received by the Spanish dignitary Herrerros, who observed that they got their singers and not their architects from Naples; to which Gioffredo replied, he would convince them that Naples had architects also worth having. Nor did he fail to make good his word, for his designs obtained the preference, although he had to contend with Sardi, Fuga, and Vanvitelli, to the second of whom, we may observe, Milizia erroneously attributes the building.

Afterwards, though he had full employment at Naples, and on government works in Calabria Ultra, where he was for some time engaged in superintending the working of the iron-mines in the Valle di Canneto, he had not many opportunities of signalling himself as an architect. The principal buildings of architectural note by him at Naples are the two palazzi Campolieto and Coscia, and the Chiesa dello Spirito Santo; for though great public improvements, the two new streets, that of Monte Oliveto and the one called De' Pellegrini, do not properly come under the head of architectural works. He has however another claim to notice in an excellent work on architecture which he published in 1768, which however he did not carry on to the extent he originally contemplated.

In 1783 his services were rewarded by his being appointed the chief government architect, with a liberal salary. Soon afterwards a disorder of his eyes, brought on by excessive study, terminated in total blindness. He fell at last into a state of profound melancholy, from which death relieved him on March 8, 1785.

GIOJA, MELCHIORRE, born at Piacenza in 1767, studied in the college Alberoni of that town, after which he was ordained priest. He showed at an early age a predilection for the mathematical sciences. When Napoleon I. invaded Lombardy in 1796, Gioja went to live at Milan, adopted republican opinions, and became a political writer. The provisional government at Milan having offered a prize for the solution of the question, "Which of the various forms of free government is best suited to Italy?" Gioja obtained the prize. He advocated a constitution on the model of the French one of 1795, with two elective chambers, an executive directory, &c., but with some modifications, by which he really believed that the establishment of liberty and political equality would be secured. The result proved unfavourable; the Cisalpine Republic, a mere dependant of France, after changing its constitution two or three times in as many years, fell before the arms of Austria and Russia in 1799. During this turbulent period Gioja wrote the following pamphlets, chiefly in reproof of those revolutionists who advised measures of confiscation and proscription against all whose opinions were different from their own:—1. 'Quadro Politico di Milano;' 2. 'Cosa è Patriotismo?' 3. 'I Partiti chiamati all' Ordine;' 4. 'La Causa di Dio e degli Uomini difesa dagli Insulti degli Empj e dalle Pretensioni dei Fanatici.' All these are curious memorials of the aberrations of opinion in those times. Gioja, after being imprisoned as a republican in 1799, was liberated in 1800, after the battle of Marengo. He now applied himself chiefly to political economy, and it is upon his works on that science that his reputation is founded. He wrote, in favour of a free trade in corn and other provisions, 'Sul Commercio dei Comestibili, e caro prezzo del vitto,' Milan, 1801. The price of bread continued however to be fixed for years after by the municipal authorities in the towns of Lombardy. His description of the department dell' Olona, or of Milan, and of that del Lario, or of Como, was considered as a model for statistical works. When Napoleon I. crowned himself king of Italy, Gioja resumed his political pamphlets, and wrote 'I Tedeschi, i Francesi, e i Russi in Lombardia,' in which he maintained that the dominion of the French was more congenial to Italy than that of the other two. He was soon after appointed historiographer of the kingdom.

Gioja's reputation rests on his 'Nuovo Prospetto delle Scienze Economiche,' 6 vols. 4to, Milan, 1815-17; a work of considerable research and labour, in which the author has collected and examined the opinions of most economists, Italian and foreign, and tried them by a comparison with the historical facts and institutions of various nations, ancient and modern. The greater part of the work is in a tabular form, the tables being furnished with quotations and notes. Gioja prefers large properties to subdivided ones, arts and manufactures to agriculture, and he advocates the principle of association as a powerful means of production; he is also in favour of a system of universal popular education. At the end of the sixth volume he gives a list of cases in which the interference of the government may be useful to industry, and another of those in which it is mischievous. As a sequel to this work he published a treatise, 'Del Merito e delle Ricompense,' 2 vols. 4to, 1818-19, a work full of bold and original ideas, many of which may be useful, whilst others appear impracticable in the present state of society. In it the author exhibits a total independence of all political systems, very different in this respect from

his former political productions. He strives to ascertain and fix a standard for the various kinds of merit or value, physical, intellectual, and accidental, of men, and to point out the authority which is to estimate the same. This last subject engrosses a chapter which is perhaps the most curious in the whole work. Few of the advocates of the political rights of the people have openly faced the question of the capabilities of the majority of that people for exercising those rights. Gioja has not shrunk from the thankless task. This chapter, iii. of book i., on the judgment of the people assembled for the purpose of election, is divided into the following heads:—1. Knowledge required in the people for making a proper choice of public functionaries. 2. Will of the people in making a choice. 3. Power or means of the people to accomplish the same object. Gioja urges the necessity of restricting the number of electors by means of qualifications of age, income, and civil and moral requisites. He insists chiefly on the qualification of mature age in the electors, whilst in the candidates for legislative functions he requires principally knowledge and morality, which he thinks might be ascertained by authentic documents. Book II. treats of the various kinds of rewards for the different degrees of civic merit; and he combats Bentham and Condorcet, who assert that virtue needs no reward.

Gioja's work, 'Dell' Ingiuria e dei Danni e del Soddisfacimento,' 2 vols. 8vo, 1821, is a kind of penal code, the main principle of which is compensation to the injured person. He proposes to fix a scale applicable to various cases, keeping in view chiefly the respective circumstances of the offender and of the offended. A good notice of the work is given in the 'Biblioteca Italiana,' for December 1821. Gioja wrote also a 'Treatise on Ideology,' 'Elements of Philosophy,' 'Il Nuovo Galateo,' or a 'Treatise on Good Manners,' and other works, among which the 'Filosofia della Statistica,' 2 vols., 1826-27, deserves especial mention. The first book treats of physical geography and its various branches, in which he includes climate; the second, of the population as affected by the physical character of the country; afterwards the movement of the population, its number, births, marriages, and deaths; the physical character of the people, their food, their habits and occupations; the third, of the productions of countries, vegetable, animal, and mineral. The work is highly interesting, and deserves an attentive perusal. Gioja died at Milan in January 1829. His remains were followed to the grave by his disciples and friends. With some eccentricities of temper, he was a most remarkable man for logical perspicuity, vastness of information, and indefatigable labour. He ranks among the very first writers on political economy that Italy has produced.

(Pecchio, *Degli Economisti Italiani*; Romagnoli published a biographical notice of Gioja in the 'Biblioteca Italiana,' No. 156.)

GIORDANO, LUCA, called LUCA FA PRESTO, was born in 1629, according to Velasco, or 1632 according to Dominici, at Naples, where he studied painting under Ribera, better known by the name of Spagnoletto. He afterwards went to Rome, where he became a pupil of Pietro da Cortona, and assisted him in many of his great works. Leaving Rome, he repaired to Lombardy to study Correggio, and then to Venice, to acquire a knowledge of the composition and colouring of the great Venetian artists. These various studies not only impressed on his mind a vivid idea of the style of every eminent master; but, as he had great readiness of hand, enabled him to imitate them so closely as to deceive even experienced connoisseurs. He had not only a fertile imagination, but such a rapidity of execution that the number of great works executed by him is astonishing. It was not from this circumstance however that he derived the name of Fa Presto, but, as is said, from the avarice of his father, who at the beginning of Luca's career sold at a high price his designs after the works of the great masters, and was continually urging him at meals as well as at work by saying, 'Luca, fa presto' ('Luca, make haste'), which his companions gave him as a nickname. After his return to Naples he was much employed there, till in 1679 he was invited by Charles II., king of Spain, to adorn the Escorial. He accordingly went to Madrid, where his polished manners, cheerful temper, and lively wit, in addition to his talents as an artist, gained him the favour of the court, where he remained till the death of Charles II., when he returned to his own country. His colouring was agreeable, his designs were spirited and ingenious, and his drawing, when he allowed himself time, correct; but from the rapidity with which he proceeded, his works are often deficient in these particulars. His best works are his frescoes, in the Escorial at Madrid, at Florence, and at Rome. Some of his finest pictures are at Dresden. The grand altar-picture in the church of the Ascension at Naples, representing the 'Battle of the Angels and the Fall of Lucifer,' is considered as one of his finest performances. He died in 1704 or 1705.

GIORGIO NE DI CASTELFRANCO (called GIORGIO BARBARELLI), one of the most distinguished artists of the Venetian school, was born in 1477 at Castelfranco, in the Trevisano. He received his education at Venice, where he at first devoted himself to music, and became an excellent performer on the lute. He however soon applied to painting, and became the disciple of Giovanni Bellini, whose minuteness of manner he speedily rejected, and adopted a much freer style, distinguished by bold fore-shortening, ample outlines, dignity and animation, breadth of drapery, richness of accompaniment, a more natural and softer gradation of tints, rich and glowing though subdued tone of

colour, and forcible effects of chiar-oscuro. This last had indeed been already practised by Lionardo da Vinci, but there appears to be no solid ground for the assertion of Vasari that Giorgione was indebted for his chiar-oscuro to some paintings or drawings by Lionardo. In the school of Bellini he had Titian for one of his fellow-pupils, who at a subsequent period of their lives was so struck with the style and colouring of Giorgione that, as some writers affirm, he became his pupil; but it appears more probable that he cultivated an intimacy with him, which was ended by the jealousy of Giorgione, who saw that his friend was becoming a formidable rival. His greatest works were in fresco, and he adorned the fronts of many large buildings in Venice with admirable works, of which nothing now remains. He painted however many oil-pictures, which are distinguished by vigorous impasto, fulness of pencil, and grandeur of colour. His portraits are of remarkable excellence, as well for their intellectual expression and dignified repose as for their singular technical merits. His historical pieces are few, and as he died so young, they are of course scarce and highly valued. 'Christ allaying the Storm,' in the school of St. Mark at Venice, appears to have been the most considerable of his historical compositions. The 'Finding of Moses,' in the archiepiscopal palace of Milan, and 'Christ bearing the Cross,' at Venice, have been looked upon as his master-pieces. He died at Venice during the plague in 1511 at the age of thirty-four, leaving a fame as a colourist only rivalled by that of Titian, and in a certain sombre glow and amenity he stands alone. On the whole, he seems to have felt the poetry of colour more truly than any other of the great colourists even of the Venetian school. Our national and public galleries possess no adequate—scarcely a genuine—example of this great painter.

GIOTTO, properly AMBROGIOTTO BONDONE, born in 1276, in the district of Vespignano, near Florence, was the son of a simple peasant and followed his father's occupation. In the half-idle employment of tending the sheep in the fields, he used to amuse himself by sketching figures, and being found by Cimabue drawing a sheep with a sharp stone on a piece of slate, this artist was so struck with the performance that he asked Giotto's father to entrust his son to him. He took him to Florence, where he instructed him in painting (in fresco or distemper, oil painting not being yet discovered). Giotto applied with great diligence to the art, and fully realised the anticipation of his master, whom he soon excelled. He first freed art from the dry gothic manner which then prevailed, and gave expression and action to his figures. He was distinguished above all his contemporaries by nobler forms, a pleasing disposition of his figures, the broad majestic folds of his draperies, and especially by a gracefulness which remained unequalled till the appearance of Masaccio. It seems likely that he was partly indebted for his superiority to the study of the antique, with which he might have become acquainted at Florence, and afterwards at Rome; and it is the more probable, as we know that he was also an architect and sculptor, and that models of his still existed in the time of Lorenzo Ghiberti. His reputation spread throughout Italy, many cities of which are adorned with his works. The greatest proof of his powers was the once celebrated mosaic of the Navicella, or boat of St. Peter, placed over the grand entrance of the church at Rome; but it has undergone so many alterations that it now affords little evidence of his talents, which however we may judge of by his still remaining works at Florence, in the 'Coronation of the Virgin,' in the church of Santa Croce, the 'Entombment of the Virgin' at Assisi, and in the 'History of St. Francis,' in Sacro Convento. He may also be called the restorer of portrait painting, and has, together with the features, given the air and character of Dante, Brunetto Latini, and Donati, the first of whom mentions him in his poems. He was a man of genius and knowledge, pleasant in conversation, and fond of poetry. Boccaccio and Sacchetti often mention him in their novels, and record his witty sayings; and Petrarch speaks of him in his letters. He went with Pope Clement V. to France, where he executed many fresco paintings. He died in 1336.

GIOVIO (JOVIUS), PAUL, was born in 1483, of a noble family of Como, and studied in the universities of Padua and Pavia. He was intended by his relatives for the medical profession, which however he forsook to devote himself to literature; and he studied the Roman classics, with a view to form his style in that language. Having repaired to Rome, soon after the election of Leo X., he found means to be introduced to him, and from that moment the pope became his patron. He was attached to the suite of Cardinal Giulio de' Medici, afterwards Clement VII., and followed him in various missions. He remained at the court of Rome after Clement ascended the papal throne, and witnessed the pillage of that city by the Imperial troops. After the restoration of peace, Clement bestowed on him the bishopric of Nocera, where he never resided, but entrusted the charge of his see to a coadjutor. He was present at the famous conference of Bologna between Charles V. and Clement VII., in 1530, and was favourably noticed by the emperor, who gave him a circumstantial account of his expedition to Tunis, to be inserted in the history which Giovio was then writing. When Paul III. became pope, Giovio fell into a sort of disgrace, that pope being zealous concerning ecclesiastical discipline, in which the Bishop of Nocera was a latitudinarian, both in his conduct and writings. (See his 'Letters.') He was accused by satirical poets of every sort of licentiousness, and was also charged with infidelity and atheism. There was malignity as well as exage-

ration in this, but Giovio was greatly deficient both in clerical modesty and piety. On withdrawing to his native Como, he built himself a delightful country residence, which he fancied, though erroneously, to be on the site of one of Pliny's villas. Here he collected a museum and a gallery of portraits of the most distinguished men of his own and former ages. He spent his time partly at his villa and partly in visiting various courts of Italy, in which he was received with marked attention. He was himself a courtier by temper and habit; his conversation was humorous, and he had always some flattery ready for the great. Berni, in his 'Orlando,' has portrayed Giovio under the name of Feradotto, at the court of King Gradasso. In one of his visits to Florence Giovio was seized with a violent fit of the gout, of which he died in December 1552, and was buried in the church of St. Lorenzo, where a statue was raised to his memory. He died rich, for he enjoyed several ecclesiastical benefices, besides pensions and presents from various princes.

Giovio left the following works:—1, 'Historia sui Temporis,' 2 vols. fol., 1550. This history, like the rest of Giovio's works, is not to be trusted implicitly, for the author's pen was always at the service of his patrons and friends. 2, 'Illustrium Virorum Vitæ,' fol. 1551: a work superior both for truth and eloquence to the first. In it the author draws the portraits of Leo X., Adrian VI., Cardinal Prospero Colonna, the Marquis Pescara, Gonsalvo of Cordova, and Duke Alfonso I. of Ferrara. 3, 'Libellus de Piscibus Romanis.' He wrote in Italian: 4, 'Commentario delle Cose dei Turchi.' 5, 'Dialogo delle Imprese,' which is a treatise on the devices or symbols adopted by the knights in the times of chivalry, and which were the origin of our coats of arms or heraldic signs. A collection of Letters of Giovio was published after his death, 'Lettere Volgari,' 8vo, Venice, 1560. Some of his facetious epistles are found in the collection of Atanagi, Venice, 1561. His letters contain much literary and historical information concerning that age, and are worthy of perusal. One of his descendants, who died in our time, Count Giovan Battista Giovio, has written a copious panegyric notice of Paolo Giovio.

GIRALDUS CAMBRENSIS. [BARRI, GIRALDUS DE.]

* GIRARDIN, EMILE DE, the natural son of a gentleman of rank of the same name, was born in Paris in 1803. His early education, by his own account, was neglected, but hard study afterwards enabled him to make up for the lost time. In 1823 he was placed in the cabinet of M. de Senonnes, where he acquired those rules of office, and that knowledge of business, so manifest in all his subsequent enterprises. Like other utilitarians in his own country, he made his début with a romance, having published in 1827, under the title of 'Emile,' a kind of autobiography. It was written in that clear trenchant style now so well known, and the critic, Jules Janin, noticed it in the 'Figaro' as a masterpiece. In 1828 he started 'Le Voleur,' a literary periodical, compiled with much tact from other men's writings. All books and journals at that period bore a high price, so that the size and quantity of this literary venture startled the public: it was in fact the first successful cheap publication produced in France. This year, M. de Girardin was appointed Inspector of the Fine Arts, one of the minor offices connected with the Ministère de l'Intérieur, or Home Department. He began to publish 'La Mode,' a fashionable paper, which advocated the cause of the sinking monarchy. It has been said by Michaud, in his 'Faux Apôtre Dévoilé,' a pamphlet written to expose the versatility of M. de Girardin, that this journal was established with funds furnished by the Duchess de Berri. Others pretend, with more apparent reason, that 'La Mode,' which supported the throne, suggested the idea of 'Le National,' which assailed and partly overturned it. In 1831, having married Mademoiselle Delphine Gay, Emile de Girardin became joint editor and shareholder of the 'Courier des Electeurs;' and in the same year, in emulation of the Libraries of Useful and Entertaining Knowledge, he founded the 'Journal des Connaissances Utiles,' one of his happiest undertakings. For, about this time, and for many years afterwards, the rapid diffusion of cheap and sound literature in England had caught the observation, and fixed the attention, of the more intelligent French enterprisers in the same walk, and the custom obtained of founding the current literature of their country upon that of ours.

He afterwards published the 'Journal des Instituteurs Primaires,' and the 'Musée des Familles.' At length, in 1836, he founded the popular daily newspaper, 'La Presse,' which, being published at fifteen sous, or half the price of most of the journals of that period, was assailed with much bitterness by the other newspaper proprietors, and led to the duel between M. de Girardin and Armand Carrel, and the lamentable death of Carrel. 'La Presse' was not only started on the principles of free trade—it became, and has continued, the strenuous advocate of those opinions; the best articles on the science of political economy being written and signed by Emile de Girardin himself, who has done as much as any public writer in France to spread more enlightened views on the subject over the continent. The circulation of 'La Presse' has been the largest obtained by any Paris newspaper for the last ten years, notwithstanding the reduction of price to which they all submitted, after the success of Girardin's experiment had been made obvious. According to a statistical table in Didot's pamphlet on the 'Fabrication of Paper,' the daily circulation of 'La Presse,' in January 1855 was 40,000 copies; that of 'Le Siècle,' 35,000; 'Le Constitutionnel,' 26,000; 'Le Moniteur,' 24,000; 'La Patrie,' 18,000; 'Le

Pays,' 14,000; and 'Les Débats,' 9000. Much obloquy has been excited against Girardin by the changes of opinion which he is alleged to have made at different stages of his career. The pamphlet already referred to, published in 1848, and containing copious extracts from his writings, has contributed to establish this belief. But absolute consistency is seldom found even in the most admired public men; and since M. de Girardin has maintained his present principles unaltered, during a course of twenty years, allowance ought to be made for his less mature age.

His other publications of note are—'La Presse Périodique au 19^e Siècle,' published in 1837; his pamphlet 'De l'Instruction Publique,' in 1838; 'L'Instruction Publique en France,' in 1840; 'La Liberté du Commerce et la Protection de l'Industrie,' in 1846. Some of these writings are reprints from his journal 'La Presse.'

M. de Girardin had been elected several times one of the representatives of the Chamber of Deputies; and it was at his urgent entreaty that Louis Philippe wrote and signed his Act of Abdication on the 24th of February 1848.

MADAME DELPHINE DE GIRARDIN, the wife of Emile Girardin, and daughter of Sophie Gay, a literary lady of considerable talents, was born in 1805, at Aix-la-Chapelle. She was what is called a precocious genius, and at the age of fourteen was noted for her remarkable beauty. In 1822 a poetical eulogy of hers, containing all the illustrious names of the day, was honourably mentioned by the French Academy. On the 26th of April 1827, she was received with great pomp in the Capitol of Rome by the Académie du Tibre, as one of their members. She received a more flattering ovation in Paris, on her return. The artist Legros, who had recently completed the new frescoes of the Pantheon, conducted Madlle. Delphine Gay to a place of honour beneath the dome, whence she recited some of her own poems in the presence of a brilliant assembly. As soon as she finished a shower of wreaths and bouquets were thrown at her feet. King Charles X. awarded her a pension of 1500 francs from his privy purse. Shortly after she met with M. Emile de Girardin, to whom she was married in 1831.

Immediately after this union Madame de Girardin engaged in a variety of literary undertakings, producing novels, romances, and fugitive poems for the booksellers; tragedies, comedies, and vaudevilles for the theatres; and feuilletons for the newspapers. Her charming 'Lettres Parisiennes' appeared in the journal 'La Presse,' under the name of Vicomte C. de Launay. The small hotel she occupied with her husband at Chaillot was the resort of all the celebrities in art and literature, as well as of the élite of the Beau Monde. Every intelligent foreigner desirous of seeing the eminent and distinguished persons, whom he already knew by name, hastened to this house, built on the model of the Greek temples.

This clever authoress died on the 29th of June 1855, and on the 2nd of July she was followed to the grave by an immense crowd. The chief funeral oration was delivered by Jules Janin.

The catalogue of her works is very long; but the following are her most esteemed productions:—'La Pélerine,' published in 1828; 'Le Lorgnon,' a romance, 1832; 'Qu'on est heureux d'être Curé,' a pastoral, 1833; 'Contes d'une Vieille Pille,' 1834; 'La Canne de M. de Balzac,' 1836; 'L'École des Journalistes,' a five-act comedy, 1840; 'Judith,' a tragedy, 1843; 'Cléopâtre,' a tragedy, 1847; 'Lady Tartuffe,' a comedy which produced much sensation, 1852; and 'La Joie fait Peur,' 1854.

GIRARDON, FRANÇOIS, a distinguished French sculptor, was born at Troyes in 1628. His father, Nicolas Girardon, a bronze-founder, designed him for the law, and he was accordingly placed with a procurer; but quickly disgusted with that profession, he devoted himself entirely to sculpture. At first he had no other assistance than the hints he derived from studying some works executed by Primaticcio's pupils, till happening to attract the notice of the Chancellor Séguier, he was enabled to obtain proper instruction, and afterwards to visit Italy, his patron having procured him a travelling pension from Louis XIV. On his return he was much employed by that monarch; yet instead of trusting to his own merit and abilities, he constantly paid his court to the painter Le Brun (who stood high in the royal favour) with more servility than became a man of talents. Through that artist's influence he obtained some distinction in the Academy of Painting, where he rose through various grades of office; but it was at the price of complying too far with the taste of Le Brun and his followers. Neither was this policy without its other disadvantages; for when Louvois succeeded Colbert as minister he took Mansard into favour, and turned his back upon Le Brun and his adherents. After the death of Le Brun however Girardon was appointed curator of the sculpture at the royal palaces. Girardon married Catharine Duchemin, a lady who obtained some reputation as a flower-painter. He died September 1, 1715, on the same day as Louis XIV.

As an artist, his works had, if less expression, generally more elegance than those of his rival Puget. With some allowance for the false taste of the time, there is in them much beauty of composition, together with correctness of forms and proportions. Their execution however is very unequal, which is to be attributed to his leaving many of his designs to be wrought either entirely or nearly so by his pupils and assistants. Among those on which he bestowed the most pains, and which are considered his chefs-d'œuvre, are the Mausoleum of

Cardinal Richelieu, the group of the 'Rape of Proserpine,' the four principal figures in the 'Bath of Apollo' at Versailles, and the bronze equestrian statue of Louis XIV., formerly in the Place-Vendôme; on the subject of which last Boffrand published a work entitled 'Description de ce qui a été pratiqué pour fondre en bronze d'un seul jet la figure équestre de Louis XIV.,' fol., 1743.

GIRAUD, COUNT GIOVANNI, one of the best and most popular writers of Italian comedy, was born at Rome on the 23th of October 1776, and was of a noble and wealthy family, originally of French extraction. Of his first studies and his early passion for the drama and everything connected with the theatre, he himself has given an amusing account in the general preface to his comedies. When he was at the age of sixteen the death of his father, Count Ferdinando, left him to frequent the theatre without restraint. Even before that time he had begun to attempt dialogues and scenes in imitation of Goldoni, Chiari, and other dramatists; but it was not till some years afterwards that he composed his first regular piece, 'I Gelosi per Equivoco,' nor was that performed till 1807. It met with decided success; and in the same year he produced his 'L'Ajo nell' Imbarazzo' ('The Tutor in a Scrape'), which is universally allowed to be his masterpiece, and one of the happiest specimens of modern Italian comedy. In 1812 he went to Paris with his elder brother Pietro, and he again visited France in 1815, after the restoration of the Bourbons, and also came over for a short time to England. On his return to Italy he published (1816) his 'Teatro Domestico,' and produced some fresh pieces for the stage, but was soon after seized with a fancy for entering into mercantile speculations and other schemes, which, besides diverting him from the career in which he had distinguished himself, failed so completely, that he was at length reduced to comparative poverty. His disappointments greatly affected both his health and his mind; he fell into a declining state, and was at last carried off by a severe nervous attack in the spring of 1834.

Giraud possesses more of comic power than is displayed by any of his contemporaries; he exhibits more of vivacity, incident, situation, and stage effect; and if his dialogue seldom rises above the level of ordinary conversation, it is free from that drawing flatness which is a frequent defect of modern Italian comedy. Some of his pieces were founded upon real circumstances, and in one instance this brought him into a very serious dispute with the family of the Marchese Albergati (another celebrated dramatist); for his 'Sospetto Funesto' was supposed by them to allude very undisguisedly to an unfortunate domestic affair, and the suspicious circumstances attending the sudden death of the marquis's second wife. The piece was in consequence prohibited; nor does it appear to have ever been published. To all of those which he did publish he prefixed a separate preface, which self-commentaries possess a value and interest of their own.

GIRODET-TRIOSON, ANNE LOUIS, one of the most celebrated of the recent French painters, was born at Montargis on the 5th of January 1767, and was the favourite pupil of David; he studied also some time in Italy. His name is really Girodet; he adopted that of Trioison in 1812, from his guardian, a physician. His first picture of note was the 'Dream of Endymion,' painted in Rome; and in 1806 he created considerable sensation by his large picture of a scene from the 'Deluge,' now in the Louvre, a composition exceeding all limits of probability, quite void of true dramatic character, dead in modelling and in colour, and good only in the academical outline of the figures, which however, though about to fall headlong, are motionless; the whole composition is an example of the awful made ridiculous by bad treatment.

There are three other works by Girodet in the Louvre—the 'Endymion,' the 'Burial of Atala,' from Chateaubriand, and the 'Revolt of Cairo,' an extremely extravagant composition. Girodet's chief merits are an elaborate execution and an academical beauty of design; but it is generally a cold lifeless beauty. One of his best pictures is 'Pygmalion and his Statue,' in the Somariva collection, which is chaste and beautiful in composition and execution, and it is a subject which does not suffer from Girodet's peculiar style: it has been engraved by Laugier.

Most of the best works of Girodet have been well engraved, as well as a vast number of designs for publishers. A collection of literary works, also by him, was published in 1829, under the title 'Les Œuvres posthumes, Poétiques, et Didactiques, de Girodet Trioison,' 2 vols. 8vo, containing also a life and correspondence.

Girodet was a member of the Academy of Painting and of the Institute of France, a knight of the Order of St. Michael, and officer of the Legion of Honour. He died December 9th, 1824. A sale of his effects was made after his death, when some of his drawings realised enormous prices.

GIULIO ROMANO, or GIULIO PIPPI, was born at Rome in 1492, and at an early age it was his good fortune to become the scholar of Raffaele, of whom he was the favourite pupil, and whose successor he may justly be considered. He assisted that great master in very many of his works, particularly in the celebrated 'Battle of Constantine,' and other frescoes in the *stanzes* of the Vatican, where he seems to have wrought with a congenial spirit, and to have been inspired by the conceptions of his instructor and guide. So great was the attachment of Raffaele to him, that at his death he made Giulio his chief heir, and further directed that all his unfinished works should be

completed by him. His name therefore is in some manner linked with that of the greatest of modern painters. From him too Giulio imbibed a taste for architecture, in which art his proficiency was such that it was as much in the capacity of architect and engineer as that of painter that he was, after the death of Raffaele, invited by Frederic Gonzaga to Mantua, for the purpose of conducting the various works which that prince had projected for the improvement and embellishment of his capital. At Rome he had already erected several buildings remarkable for their taste, including the Villa Madama, the Villa Lante, and the two small palazzi, Alberini and Cenci, the casino belonging to the first-mentioned of which has always been greatly admired by artists for the invention and classical elegance shown in its arabesques and other decorations.

Arrived at Mantua, he found an ample and varied field open to his talents, being called upon to exercise them on works of the most opposite character, from those whose merit lay in scientific skill and construction to those which afforded him an opportunity of displaying his fancy in their elaborate embellishment. Among the former were those for draining the marshes, and securing the city from the inundations of the Po and Mincio; and among the latter, the decorations and spectacles got up on the occasion of the emperor Charles V.'s visit to Mantua. But that of the greatest note was the palace called the Te, of which he was not only the architect, but adorned the apartments with a variety of admirable stuccoes and paintings executed by himself and his pupils. The building itself indeed is rather plain externally, being a simple square of about 190 feet, and of rather low proportions, as it consists of only a single order (Doric), comprising two ranges of windows, the upper one of which is a mezzanine. The whole is sufficiently sober, for the windows are without dressings; neither is there any other embellishment besides the order itself and the rusticated surface of the walls. The simplicity which reigns throughout is increased by the entablature being carried quite unbroken along the whole extent of front, which it terminates, there being neither attic nor balustrade above it. Yet if in respect to its exterior this edifice does not offer much for description, it would require a volume to enumerate and explain all the various decorations of the interior—the profusion of stuccoes, friezes, and frascos, with which the different apartments are adorned. One of the most remarkable is that named the Sala de' Giganti, the walls being entirely covered with figures representing the defeat of the Titans—a subject treated by him with such astonishing energy that Giulio has here shown himself equal to the style of Michel Angelo; while in the series representing the history of Psyche he has emulated Raffaele, though he falls far short of him in delicacy and refinement. Unfortunately, both these works have been so retouched and repaired that they now exhibit very little of the original execution, and therefore show only their design and composition, and the poetical genius of their author, which, according to Reynolds, he possessed in a higher degree than any other artist before or since. Even the embellishment of this palace alone would appear to have been nearly the work of an entire lifetime; and such indeed it must have proved had not Giulio contented himself with giving his designs and cartoons to be copied by his pupils, which being done, it was his practice to go over the whole of each painting, correcting it and finishing it up until he had stamped it with the character of his own pencil.

Besides the edifices already mentioned, he restored or embellished various churches at Mantua, and especially the cathedral, which, although comparatively seldom spoken of, is one of the finest buildings of its kind in Italy. Giulio however did not live to see it finished, but it was completed after his death by his pupil Bertano. He died in 1546, as he was on the point of quitting Mantua; for notwithstanding the high repute and favour he enjoyed there, his ambition tempted him to accept the offer of succeeding Sansovino as the architect of St. Peter's, although he had previously refused the pressing instances of Francis I., who was anxious to engage him in his service.

As a painter Giulio was by no means so happy in colouring as in design and invention, which, if occasionally rather forced and extravagant, were for the most part highly noble. He chiefly excelled in mythological subjects, nor was he always very scrupulous in treating them, many being exceptionable on account of their voluptuousness. Indeed it is said that his chief inducement at first for removing to Mantua was to abscond from Rome, where he was implicated in an affair that will ever be a blot in his character; it being reported that he had furnished the engraver Mark Antonio Raimondi with a series of obscene drawings for as many sonnets of Aretino. Raimondi was thrown into prison; and, had he remained at Rome, Giulio would in all probability have shared the same fate, and not undeservedly.

While at Mantua he formed a sort of school, the most eminent scholars of which were Primaticcio and Rinaldo Mantovano.

* GLADSTONE, THE RIGHT HON. WILLIAM EWART, M.P., is the fourth son of the late Sir John Gladstone, Bart., of Fasque, N.B., an eminent merchant of Liverpool, by a daughter of the late Provost Robertson of Dingwall, N.B. He was born at Liverpool in 1809, and received his early education at Eton, and afterwards at Christchurch, Oxford, of which he was elected a student in 1829, and where he graduated as a double first-class in 1831. Having spent several months in a tour through a great portion of the continent, he was elected member of parliament for Newark, in the Conservative interest, in

December 1832, through the influence of the late Duke of Newcastle, just at the time when the struggle of parties was past its height. His mercantile origin, the success of his university career, and his habits of business, in which he strongly resembled the late Sir Robert Peel, all joined to recommend him to the notice of that statesman, who, on taking office in December 1834, appointed Mr. Gladstone a Lord of the Treasury; and in February 1835, under-secretary for colonial affairs. Mr. Gladstone retired from office together with his leader in the following April, and remained in opposition till Sir Robert Peel's return to power in Sept. 1841, when he was sworn a member of the privy council, and appointed vice-president of the Board of Trade, and Master of the Mint. In this position it was his duty to explain and defend in parliament the commercial policy of the government, in which his mercantile origin and connection proved of great service. The revision of the British tariff in 1842 was almost entirely his work. When brought before the House of Commons this laborious work was found to be as admirably executed in its details as it was complete in its mastery of principles; and it received the sanction of both houses with scarcely an alteration. In May 1843 he succeeded Lord Ripon as president of the Board of Trade, but resigned office early in 1845. In January 1846 Sir Robert Peel announced his intention of proposing a modification of the existing corn-laws. Mr. Gladstone, who had recently succeeded Lord Stanley in the post of Secretary of State for the Colonies, adhered to his leader, but, being unwilling to remain under obligations to the Duke of Newcastle, he resigned his seat for Newark, and remained out of parliament for several months. At the general election of 1847 however, he was chosen as representative of the University of Oxford. In this parliament the questions of university reform and the repeal of the last remaining Jewish disabilities were frequently agitated. Mr. Gladstone consequently found himself frequently opposed to his own friends, and finally separated himself from the rest of the Conservative party by refusing to take office under the Earl of Derby in February 1852. In the July of that year he was again returned for the University of Oxford, and in the following November it was mainly in consequence of his able speech upon Mr. Disraeli's budget that the Derby ministry were thrown out of office. On the accession of Lord Aberdeen to power, Mr. Gladstone was appointed to the Chancellorship of the Exchequer, in which office the thorough knowledge of finance which he had acquired in early life proved again of the greatest assistance.

On the breaking-up of the Aberdeen ministry, or rather on its reconstruction under Lord Palmerston, Mr. Gladstone continued to hold the same post, but resigned it in the course of a few days on finding that Mr. Roebuck intended to persevere in his resolution for the appointment of the Committee of Inquiry into the State of the British Army before Sebastopol. Since then Mr. Gladstone has held no public office up to the present time (September 1856), but has contented himself with lending to Lord Palmerston's ministry an independent support on matters in which he could approve of their general policy. Though at first he was opposed to the idea of any university reform effected by the state, yet recently he has lent to the government very valuable assistance in supporting the suggestions of the university commissioners by his personal and official influence with the authorities of Oxford as member for that university.

In his private capacity Mr. Gladstone has always been highly esteemed, and his name is not unknown to fame as an author. His treatise, entitled 'The State Considered in its Relations with the Church,' published in 1840, and his 'Church Principles Considered in their Results,' in 1841, each in one vol. 8vo, stamped him, while still a young man, as a deep and original thinker. His views, we need hardly say, as unfolded in those books, had been formed by the education and associations of Oxford, to which university they are dedicated. They were thought worthy of discussion at the time by Mr. Macaulay in the pages of the 'Edinburgh Review.' In the fifteen years which have elapsed since he published those works, his religious views have however undergone a considerable modification; and they are now far less theoretic, and more in harmony with the existing condition of things both in church and state.

His 'Remarks on Recent Commercial Legislation,' published in 1845, gave an able and elaborate detail of the beneficial working of the tariff of 1842, and were intended to pave the way for the great modification of the then existing system of commercial restriction, which was carried into effect in the following year. In 1851 Mr. Gladstone gave to the world a work which created considerable interest both in England and upon the continent. In 1850, during a sojourn at Naples, he found a very large number of Neapolitans, who had constituted the opposition in the Chamber of Deputies, either imprisoned or exiled by King Ferdinand, and also discovered that from 20,000 to 30,000 other Neapolitan subjects had been thrown into prison on the charge of political disaffection. Mr. Gladstone having ascertained the truth of the facts, wrote a letter to the Earl of Aberdeen, urging his interposition on their behalf; and on Lord Aberdeen's remonstrances proving ineffectual, he published an indignant letter on the Neapolitan victims, which was translated into several languages, and transmitted by Lord Palmerston to all our ambassadors on the Continent, to be forwarded by them to their respective courts. The result was that some relaxation of their sentence was granted to the unhappy inmates of the Neapolitan prisons.

From his first entrance into the House of Commons, Mr. Gladstone's reputation has always stood high as a Parliamentary orator. His voice is clear and musical, his command of language perfect, his expression ready and fluent; and there is a stateliness and finish in the flow of his periods, which is seldom met with in the present day. Whatever question is before him, he is sure to take it out of the beaten path of debate, to present it in some new and unexpected light, and to invest it with classic and historical allusions.

In 1839 he married Catharine, daughter of the late and sister of the present Sir Stephen Richard Glynne, Bart., of Hawarden Castle, by whom he has a youthful family.

GLANVILLE, RANULF DE, was chief justiciary of England in the reign of Henry II.; he accompanied Richard I. in the Crusade, and fell at the siege of Acre in 1190. He is supposed to be the author of one of the most ancient treatises on the laws and customs of the realm of England. The work ranks with those of Britton, Bracton, and Fleta, the ancient text-writers of the law, and is believed to be more ancient than them. Though generally ascribed to him, the titles to some of the best manuscripts only set forth that it was written in his time. Earlier than his time it cannot be, for among the exemplifications of law processes are some which took place in court before this Ranulf.

The study of this writer is necessary to those who would obtain a critical knowledge of the state of the English constitution in the first century after the conquest, before the constitution underwent the modification which the granting of the Great Charter by King John occasioned; and the facilities for studying it are much increased by the publication in 1812 of a translation by J. Beames, Esq. There is room for an edition of the original, improved by the collation of the best manuscripts which exist of it, one of which is to be found in the library of the Honourable Society of Lincoln's Inn.

GLANVILL, JOSEPH, was born at Plymouth in 1636. He was educated at Exeter College, Oxford, and graduated B.A. in October, 1655. The following year he removed to Lincoln College, took his M.A. degree in June, 1658; assumed—without ordination it is said—the priestly office, and became chaplain to Rouse, the Cromwellian Provost of Eton. In 1661 he published in a small 8vo. volume his 'Vanity of Dogmatizing,' which, when revised and extended, appeared in 1665 in a 4to volume, under the title of 'Scep sis Scientifica; or Confessed Ignorance the way to Science.' This work he dedicated to the newly founded Royal Society, who, on the presentation of a copy of it, elected Glanvill a fellow. The work is directed against admitting as established any mere opinions in science, in other words, against the Aristotelian philosophy, and in defence of what was termed the 'new,' or experimental and inductive method. It is a very striking production both in matter and style, and full of original and independent thought. As Hallam says of it in his 'History of Literature,' "few books are more deserving of being reprinted."

Soon after the restoration of Charles II., Glanvill obtained the rectory of Wimbush, in Essex, and in 1662 he was presented to that of Frome Selwood, in Somersetshire. In this year he published his 'Lux Orientalis,' in which he treats of the pre-existence of souls; adopting as the basis of his reasoning the views of Henry More. In 1666 he published 'Considerations, touching the being of Witches and Witchcraft,' as a supplement to which he prepared a collection of cases in support of his belief, entitled, 'Sadducismus Triumphans,' which, after Glanvill's death, was edited by Henry More of whom Glanvill was an earnest disciple. In 1666 he was presented to the rectory of the Abbey church, Bath. The following year he published his 'Defence of the Royal Society,' and in 1663 he followed this by a further and more complete defence, entitled, 'Plus Ultra, or, the Progress and Advancement of Knowledge since the days of Aristotle.' In 1667 he entered upon a controversy with Mr. Robert Crosse, vicar of Great Chew, and Dr. Henry Stubbe, physician, at Warwick, which led to several very angry pamphlets. Glanvill was very eminent as a preacher, and was frequently called upon to preach on public occasions. In 1678, he published an 'Essay on Preaching,' to which he added 'A Seasonable Defence of Preaching, and the plain way of it.' The same year he received from the king, who had already appointed him to be one of his chaplains in ordinary, a prebendal stall in Worcester Cathedral; and he exchanged the rectory of Frome for that of Street. He died Nov. 4, 1630. Besides the works already mentioned, Glanvill published 'Essays on several Important Subjects in Philosophy and Religion,' and several single sermons. After his death a volume of his 'Discourses, Sermons, and Remains' appeared, edited by Dr. Henry Horneck, who wrote a warm eulogy upon him, both as a man and an author.

GLAREANUS, HENRICUS LORITUS, a most learned writer on music, was born at Glaris in Switzerland, in 1438. He studied under Erasmus, with whom he lived in the strictest intimacy; and his master for music was Johannes Cochläus, author of 'Tetrachordum Musicae,' a work in quarto, which went through many editions. Glareanus was a man of profound erudition, and remarkable for his general knowledge. The emperor Maximilian I. bestowed on him the laurel crown, as a proof of his admiration of his poetry. His work, entitled 'Dodecachordon,' in 1 vol. folio, 1547, now exceedingly rare, is important, inasmuch as it makes us thoroughly acquainted with the state of music in the 16th century. He was a zealous advocate for

the ancient modes, in each of which, as he views them, he gives several compositions for many voices, chosen from the most esteemed works of the best masters of his time. These compositions will interest the practical musician more than the author's dissertations; though the latter can never be slighted by the musical historian, or by those who wish to penetrate deeply into what are now become the antiquities of the art.

GLASS, JOHN, founder of the sect of Glassites in Scotland, was born on the 21st of September 1695, at Auchtermuchty, a parish in the county of Fife, of which his father was clergyman. He studied at St. Andrews and Edinburgh, and in 1719 was ordained minister of the parish of Tealing near Dundee. He became a popular preacher, and his sermons, extending to two or three hours in length, were attended by crowds of people from distant parts of the country. He exhibited his disposition to differ from the other members of the Church of Scotland, by attacking the principles of the Solemn League and Covenant, and other public declarations intimately connected with the growth of the Presbyterian polity. He was deposed by the church courts on the 12th of April 1728. His position being reconsidered by the General Assembly of 1739, it would appear that they decided that he was entitled to retain his status as an ecclesiastical person, but not to hold a benefice, as he refused to comply with the necessary tests. He had in the mean time removed to Dundee, where a few hearers gathered round him, and, gradually accumulating, formed a considerable sect. It is not easy from any known announcement of them to discover their tenets; they have a mystical appearance, and relate to a spiritual union which binds the members into one body as a church, without its being represented by an outward ecclesiastical polity. The Glassites are generally respectable people, and their founder lived an unspotted life. He died in 1773.

GLAUBER, JOHN (called POLIDORE), born at Utrecht in 1646, studied painting under Nicholas Berghem, under whom he made a very rapid progress. Besides the fine works of his celebrated master, he had the advantage of seeing many works of the great Italian landscape painters at the house of a picture-dealer named Vlyenburg, with whom he spent some years, studying and copying from the best works of the Italian painters. He then resolved to go to Rome, stopped a year at Paris with Picart, a flower-painter, and two years at Lyon with Adrian Van der Cabel, and would have remained longer had he not been tempted to join the crowds going to the Jubilee at Rome. He stayed two years in that city, and as long at Venice, neglecting no opportunity of improvement. On his return home he settled at Amsterdam, and formed an intimate friendship with G. Lairese, who often enriched his landscapes with elegant figures. Glauber is one of the ablest Flemish landscape painters, but wanting in originality. His taste and manner were Italian: most of his scenes are from the environs of Rome, and sometimes from the Alps. Many of his works are in the style of G. Poussin. He died in 1726, aged eighty.

GLAUBER, JOHN RUDOLF. This extraordinary man and laborious chemist was born in Germany towards the close of the 16th century. His works were published at Amsterdam, and in 1689 they were translated into English by Mr. Christopher Packe, in one large folio volume. Although an alchemist and a believer in the universal medicine, he endeavoured to improve chemical processes and the arts to which they are applied. One of his most important discoveries is that of the salt which yet bears his name, and he greatly improved the processes for obtaining nitric and muriatic acids. In his works there is also a representation, though certainly a rough one, of the apparatus now known by the name of Woulfe's apparatus, used, as is well known, for the condensation of gaseous products arising in distillation. The production of vinegar of wood, afterwards called pyroigneous acid, now so largely employed in the manufacture of acetic acid, and various acetates used in the arts; the distillation of ammonia from bones, and its conversion into sal-ammoniac by the addition of muriatic acid; the preparation of sulphate of ammonia, and its conversion into muriate by the agency of common salt; the production of sulphate of copper by acting upon green rust of copper with sulphuric acid, are among the more important of his numerous discoveries. The directions which he has given for the preparation of what he called his 'sal mirabile,' Glauber's salt, or sulphate of soda, are in general sufficiently correct, and its properties are stated with considerable minuteness and accuracy. He died at Amsterdam in 1668.

Glauber did much in improving and inventing chemical apparatus, some of which are described and depicted in his works. His works hardly repay a minute perusal, yet they contain much which excites admiration for a man who, in so early a period of chemical research, so greatly contributed to its advancement.

*GLEIG, REV. GEORGE ROBERT, is a son of the late Bishop Gleig of the Protestant Episcopal Church in Scotland, and was born in 1795. He received his early education at Glasgow, and at Balliol College, Oxford; but instead of proceeding with his university studies, he joined a regiment on its way to Spain in 1813, as a volunteer. Obtaining a commission in the 85th Foot, he went through one or two campaigns in the Peninsula, which he faithfully described in an amusing style in his novel called the 'Subaltern.' After the end of the war in Spain, he served in America, and was present at the capture of Washington. Retiring from the army on half-pay, he resumed his studies where they had been broken off, took his degree at Oxford,

and was ordained. In 1822 the Archbishop of Canterbury (Manners-Sutton) presented him with a small living in Kent, and about twenty years later he was appointed to the chaplaincy of Chelsea Hospital. In 1846 he was gazetted Chaplain-General to the Forces. In this capacity his active mind soon found a field for exertion, and he drew out a scheme for the education of soldiers. This was eventually approved at head quarters, and he was appointed Inspector-General of Military Schools. Mr. Gleig has been a voluminous writer of novels and popular histories, or historiettes; of the former his 'Chelsea Pensioners,' 'Country Curate,' the 'Hussar,' and the 'Subaltern' are most popular; among the latter we may mention his 'Family History of England,' his 'Military History of Great Britain,' 'Campaign of New Orleans,' and 'Story of the Battle of Waterloo,' reprinted in Murray's Home and Colonial Library; and his 'Account of the Leipzig Campaign,' reprinted in Messrs. Longman's Traveller's Library; also his Lives of Lord Clive and Sir Thomas Munro.

GLENDWR, OWEN, was born in Merionethshire about 1349. He was maternally descended from Llewelyn, the last prince of Wales, whose grand-daughter Elena married Gryffydd Vyoban, of which marriage Glendwr was the offspring. He appears to have had a liberal education, was entered at the Inns of Court in London, and became a barrister. It is probable that he soon quitted the profession of the law, for we find that he was appointed squire of the body to Richard II., whose fortunes he followed to the last, and was taken with him in Flint Castle. When the king's household was finally dissolved, he retired to his patrimony in Wales. He was knighted in 1387, and was married early in life to Margaret, daughter of Sir David Hanmer, of Hanmer, in the county of Flint, one of the Justices of the King's Bench by the appointment of Richard II. By her he had several sons, and five daughters; most of his sons fell in the field of battle to which they accompanied their father in 1400.

Owen had engaged in a dispute about the boundaries of his lordship of Glendwrwy with Reginald lord Grey de Ruthyn, an Anglo-Norman whose seignories adjoined his own. Taking advantage of the deposition of Richard, Lord Grey had forcibly possessed himself of a piece of land named Croeseu, which Owen, in the former reign, had recovered from him by course of law. Glendwr laid his case before parliament, but his suit was dismissed. To this provocation Reginald de Ruthyn added another insult, by purposely detaining the writ that had been issued to summon Owen, with the other barons, to assist Henry IV. in his expedition against the Scots. Lord Grey misrepresented to the king the absence of Glendwr as an act of wilful disobedience, and afterwards treacherously took possession of his lands, under the pretence of forfeiture. More temperate proceedings were advised by Trevor, bishop of St. Asaph; but no representations of Owen's power had any influence on Lord Grey. The Welsh were at this time little better than barbarians: they hated the English because of the laws which punished their bards as vagabonds, allowed no Welshman to hold the smallest public office in his native country, and maintained foreign garrisons in their towns and castles. They were regarded in return as an ungovernable, plundering, rebellious race. Out of their condition arose the power of Glendwr. With the assistance of the bards, who asserted him to be gifted with supernatural skill, his fame was spread through the whole of Wales, and his influence so rapidly increased, that, after levying a body of troops, he at once proclaimed his genealogy, and laid claim to the throne of Wales. In the summer of 1400 he attacked the estates of his enemy Lord Grey, and in his absence seized upon his lands. As soon as the news of these exploits had reached the king, he sent lords Talbot and Grey to reduce Glendwr. Their attack upon his house was sudden, and he with difficulty escaped. He next marched upon the town of Ruthyn, which he took, pillaged, and burnt during the time of a fair, and then retired to his fortifications in the hills. His proceedings were so alarming that the king soon resolved to march against him in person. In September 1400, a proclamation was issued from Northampton, commanding the lieutenants of Warwickshire, Leicestershire, and eight other counties to assemble forces, and on a given day to join the regular army at Coventry.

A grant was also made to the king's brother, John, earl of Somerset, of all Glendwr's estates in North and South Wales, in the hope that this powerful nobleman might be urged by the motive of immediate personal interest to dispossess the rebel of his property. Glendwr's revenue in money did not exceed 300 marks (200*l.*), but his rents in service and in kind were probably considerable. Notwithstanding all difficulties, his ranks were continually increased by fresh recruits. The king, who had now (1400) penetrated as far as the Isle of Anglesea, plundered a Franciscan convent at Llanfaes, slew some and carried away others of the monks (who were however eventually restored to liberty), and re-peopled the monastery with English. The Franciscans were known to have assisted Prince Llewelyn, and to have espoused the cause of his successor. Henry at last caused his army to retire, for the further prosecution of his expedition had been rendered useless by the retreat of Glendwr and his troops to the mountains in the neighbourhood of Snowdon. At the suggestion of Prince Henry, a free pardon was offered to the rebels in several Welsh counties, which brought over to the king's authority thirty-two of the principal adherents of Glendwr. Nothing daunted by the diminution of his forces, but trusting as usual to the protection afforded by a moun-

tainous country, Glendwr marched to Plinlimmon in the summer of 1401, and proceeded to ravage the surrounding country: he sacked Montgomery, burned the suburbs of Welshpool, destroyed Abbey-cwm-Hir, and took the castle of Radnor, where he beheaded the garrison to the number of sixty. The Flemings (who in the reign of Henry I. had settled in Pembrokeshire), incensed at his incursions, raised a force of 1500 men, and were so expeditious in their movements, as, unexpected and unnoticed, to surround him at Mynydd Hyddgant. Hemmed in on every side, Glendwr broke through their ranks, and 200 of the Flemings remained dead upon the field. These depredations and victories awakened the fears of the king, and a second expedition into Wales was determined upon. Early in June (1401) the king was at the head of his troops, but after razing to the ground the abbey of Ystrad Eflor, and pillaging the county of Cardigan, he withdrew his army, already exhausted by famine and disease. The extent of the popularity of Glendwr's cause among the Welsh may be estimated by a complaint now made by the Commons to the king and the upper house of parliament, that the Welsh scholars had left the English universities in order to aid in the rebellion at home, and that even the Welsh labourers had provided themselves with warlike weapons and quitted the service of their employers. In 1402 the event of a comet was interpreted by the bards as an omen most favourable to his cause. Predictions gave new energy to his followers, and Glendwr advanced towards Ruthyn, drew Lord Grey into the field, surprised him with an ambush, and carried him off captive to his camp near Snowdon: the prisoner's release was granted only upon the payment of 10,000 marks (8666*l.*), and on his entering into an engagement to observe a strict neutrality. For his better security, or perhaps by compulsion, Lord Grey married Jane, the fourth daughter of Glendwr, immediately upon his liberation. Being now free from English opponents, he turned his arms against such of his countrymen as had adhered to the English or forsaken his cause: he marched upon Caernarvon, and closely blockaded the castle.

The cathedral of Bangor, and the cathedral, palace, and canons' houses at St. Asaph, were destroyed at Owen's command. His excuse for these outrages was that Trevor, bishop of St. Asaph, had been disloyal to Richard, from whom he had received his preferment. Trevor subsequently revolted from King Henry, allied himself to Glendwr, and did not quit the see, in which Owen confirmed him, until that chieftain's fortunes declined, when he prudently retreated to Paris.

The king, determining upon a third expedition into Wales, called upon his principal subjects to assemble at Lichfield. In the meantime Glendwr had defeated Sir Edmund Mortimer at Pilleth Hill, not far from Knighton, in Radnorshire, and had left dead upon the field 1100 of Mortimer's followers, whose bodies were treated by the Welsh women with atrocious indignities. Sir Edmund, who was himself made a prisoner, was uncle to Edward Mortimer, earl of March (then about ten years old), whose title to the crown having been acknowledged by the parliament, he was kept in close custody by the king. In consequence we may suppose of this relationship, Henry could not be prevailed upon to take measures for his ransom—a refusal which, joined to the humanity and respect with which he was treated by his captor, induced him to become a partisan of Glendwr, whose subsequent alliance with the Percies was mainly attributable to Mortimer. Instead of assembling one army at Lichfield, Henry determined to raise three separate divisions, and to attack the Welsh from three different quarters at the same time. It was arranged that the king should muster the first division at Shrewsbury; Lord Warwick, Lord Stafford, and others were to assemble the second at Hereford; while Prince Henry was to have the command of the third at Chester. Owen Glendwr in the meantime made an inroad into Glamorganshire, burnt the houses of the bishop and archdeacon of Llandaff, set fire to Cardiff and Abergavenny, and then returned to oppose the English. Too prudent to hazard an encounter with a force far superior to his own, he concealed himself among the hills, driving away all the cattle and destroying all the means of subsistence. At this time the rebellion seemed likely to gain ground, for the confederates—Mortimer, the Percies, and Glendwr—confiding in their own power, determined to divide the whole kingdom among themselves; for which purpose they met at the house of Aberdaron, dean of Bangor, a descendant of Caradoc, prince of Wales, and strongly attached to the cause of Glendwr. They agreed upon the following allotments: Mortimer, in behalf of the Earl of March, was to take possession of all the country from the Trent and the Severn to the southern and eastern limits of the island; Northumberland claimed all lands north of Trent; the district westward of the Severn was apportioned to Glendwr. It was at this juncture that Glendwr revived the ancient prophecy that Henry IV. should fall under the name of 'Moldwarp,' or 'the cursed of God's mouth'; and styling himself 'the Dragon,' he assumed a badge representing that monster with a star above, in imitation of Uther, whose victories over the Saxons were foretold by the appearance of a star with a dragon threatening beneath. Percy was denoted 'the Lion,' from the crest of his family; and on Sir Edmund Mortimer they bestowed the title of 'the Wolf.' Owen, who was now at the zenith of his glory, called together the estates of Wales at Machynlleth, and there was formally crowned and acknowledged Prince of Wales. Some of his enemies however as well as his allies assembled at this meeting, and he narrowly escaped assassination.

In 1403 Glendwr and Mortimer marched towards Shrewsbury, in order to join their troops to the army of Percy, which was encamped near that town. It required all the vigilance of Henry to prevent this union, but by forced marches he succeeded in reaching their position when only a small portion of Owen's army had arrived. An engagement took place at Battle Field, three miles from the town, in which Percy fell. Little was done during the rest of this year beyond the king's securing the Welsh castles, and intrusting them to persons of tried fidelity. In the following year (1404) Owen Glendwr entered into a treaty, offensive and defensive, with Charles VI., king of France, which was concluded at Paris on the 14th of June. He then opened the campaign with fresh vigour, ravaged the enemy's country, took the castles of Harlech and Aberystwyth, and several others, of which many were dismantled and some garrisoned. In the beginning of the year 1405 Glendwr made an attempt to liberate the young Earl of March, with the intention of making him contest the crown with Henry. He persuaded Constance, widow of Lord Spencer and sister to the Duke of York, to assist in setting him free; by means of false keys she effected his escape, and was in the act of conducting him to Wales when they were seized and brought back.

About this period (March, 1405) Owen's fortunes began to decline: he was attacked at Grosmont Castle, about twelve miles from Monmouth, and driven back by Henry, the young Prince of Wales, then only seventeen years of age, to whom the king had intrusted the conduct of the war. Eight hundred men remained dead upon the field, as the English gave no quarter. During the same month he suffered a second defeat at Mynydd pwl Melyn, in Brecknockshire: in this engagement there were killed or made prisoners 1500 of Owen's followers; one of his sons was taken prisoner, and his brother Tudor fell in the action. After these reverses all Glamorganshire submitted to the king, and Glendwr was compelled to wander over the country with a few faithful friends, concealing himself in remote and unfrequented places. There is a cave in the county of Merioneth, known by the name of Ogof Owain (Owen's Cave), in which he is said to have been secretly maintained by an old and trusty adherent. He is supposed to have instigated the conspiracy that was headed by Northumberland, but which being speedily detected was followed by the execution of several of the abettors: Northumberland found it necessary to fly to Scotland for protection. After quelling this revolt the king marched upon Wales with an army of 37,000 men, but stormy weather and other contingencies forced him to retreat to Worcester.

It was fortunate for the declining power of Glendwr that the French now determined upon executing the scheme which had long been feared by the English and hoped for by the Welsh. A fleet of 140 ships, commanded by Renaud de Trie, admiral of France, disembarked 12,000 men at Milford Haven. Caermarthen capitulated: Haverfordwest was successfully defended by Lord Arundel. At Tenby, Glendwr joined them with 10,000 men, and thence the whole army marched through Glamorganshire to Worcester, laying waste the country up to the very suburbs of the town. Henry now again took up arms, and made use of every means in his power to counteract the measures of so formidable an enemy. Lord Berkeley received orders to burn fifteen of the French ships that were lying at anchor in Milford Haven, and to intercept some others which were conveying stores and ammunition to the invaders. Hugueville, the commander of the French crossbowmen, and Owen, chose a strong position: the former encamped on a high hill, three miles from Worcester, a wide valley lying between him and the English; Glendwr posted himself nine miles from the town, on Woodbury Hill, which was surrounded by a fosse. The armies were arrayed before each other in order of battle for three successive days and nights, and repeated skirmishes took place, in which the loss that both sides sustained was computed at 200 men, besides the wounded: at the end of this time the French and their allies retired into Wales, having been harassed incessantly by the watchfulness of Henry's troops, who had cut off all their supplies. Shortly after this attempt the French quitted the kingdom in vessels that Glendwr furnished for their use. The castle of Llanbedr, in the county of Cardigan, surrendered the same year, on certain conditions, to Henry, prince of Wales; that of Coitie, on the river Ogmere, was besieged by Glendwr, and a loan was raised in both houses of parliament for the purpose of effecting the rescue of its owner.

Notwithstanding occasional assistance from his foreign allies, Owen's strength continued to decline; so many of his adherents deserted him, that he chiefly confined himself to the mountains, and rarely descended from them, except on predatory excursions. Two years afterwards, Glendwr again began to make head against the English by devastating the Marches, and seizing the property of those who refused to join him; but Lord Powys, who was commanded by the king to take active steps against the renewed incursions of the rebels, fortified several castles, and subsequently took prisoners Rhys Ddu and Philip Scudamore, two of Owen's best officers, who were carried to London, where they were executed as traitors. Another similar effort proved unavailing, and Glendwr concluded a treaty with some of the lords-marchers, but it was disclaimed and rescinded by the king as illegal. Compelled to abandon this project, he retired into comparative obscurity. On Henry's death Glendwr, though still inaccessible, was so closely watched as no longer to be formidable. Still he carried on

a petty and annoying warfare, which Henry V. at first endeavoured to put an end to by conciliation; but finding this method unsuccessful, he afterwards enacted several severe laws to restrain the Welsh. At the expiration of two years the king deputed Sir Gilbert Talbot to negotiate a treaty with Glendwr, offering him and his followers a free pardon should they entreat it. The result of these proceedings does not appear: it is probable that they were interrupted by the decease of Glendwr. On the eve of St. Matthew, September 20th 1415, after a life of risk and danger, this turbulent chief died a natural death, at the house of one of his daughters. There is a tombstone in the churchyard of Monnington-on-Wye, which is commonly believed to mark his grave, but no inscription or memorial whatsoever exists to corroborate the tradition.

Glendwr possessed many qualities which eminently fitted him for a warrior; he was active, enterprising, and courageous, and, when opposed to a superior force, both vigilant and cautious. But, on the other hand, he was rapacious and careless of injuring others, though bitterly revengeful of any injury committed against himself. Cruel by nature as well as policy, he was the scourge rather than the protector of his country.

GLINKA, GREGORY ANDREEVICH, a Russian author of some note, was born in 1774, of a noble family, in the government of Smolensk; was educated at the college of the imperial pages; became an officer in the army, and, taking his discharge in 1800, astonished the Russian world by soliciting and obtaining in 1802 the professorship of Russian literature at the University of Dorpat. Up to that time there had been no instance of a nobleman by birth engaging in the business of education, and Glinka was in possession of an ample private fortune. After eight years at the university he resigned, and in 1811 was selected by the empress-mother to give instruction in Russian literature to the Grand Duke Nicholas, afterwards emperor, whom he accompanied in his travels on the Continent, and in England in 1816, in the capacity of 'Cavalier,' or principal gentleman of his suite. He was to discharge a similar duty to the Grand Duke Michael, but was carried off by a sudden illness at Moscow, on the 8th of February (old style) 1818. Glinka was the translator of several works from the French and German: his most important original production was a dissertation 'On the Ancient Religion of the Slavonians,' Mittau, 1804, 8vo. A list of his writings will be found in the thirteenth volume of the Russian 'Entsiklopede-chesky Lexikon,' from which the above particulars are taken.

GLINKA, SERGY NIKOLAEVICH, an active and voluminous Russian author, the particulars of whose biography as given by Grech in his 'History of Russian Literature,' bear a striking resemblance to those of his name-ake, Gregory Glinka. He was born in the government of Smolensk in 1774, entered the army in 1796, retired from it with the rank of major, gave up the whole of the family property to his sister as a dowry, and employed himself in the education of youth, first in the Ukraine and afterwards at Moscow. From 1808 to 1820 he edited the 'Russian Messenger' ('Rusky Viestnik'), a magazine which contains valuable materials for Russian history. A collection of his works in twelve volumes was published at Moscow between 1817 and 1820. His compositions are almost all patriotic:—a poem, in ten cantos, is devoted to the celebration of the Tsarina Natalia, the mother of Peter the Great; the tragedies and operas are on 'The Fall of Kazan,' 'Minin, the Expeller of the Poles,' 'Saverov in Italy,' &c. 'Russian Tales' and 'Russian Anecdotes' occupy the remaining volumes, with the single exception of a translation of Young's 'Night Thoughts.' This collection does not include a 'History of Russia for the Use of Youth,' which was originally issued in ten volumes, and reprinted in fourteen. A 'History of the Migration of the Armenians of Azerbaijan from Turkey to Russia,' was published by Glinka in 1831, and translated into German by Professor Neumann in 1834. The latest work we have seen bearing Glinka's name is 'Russkoe Chtenie,' 'Russian Reading: Historical Memorials of the Country in the 18th and 19th Centuries,' 2 vols., St. Petersburg, 1845. The contents are—original information on the last days of Potemkin; the intercourse of Rostopchin and Suvorov; the public characters of the age of Catharine the Second, &c.;—in fact, like many of Glinka's works, it is a collection of materials interesting in themselves, and which will be of value to the future historian. In the preface, which is dated from St. Petersburg in August 1845, the author speaks of his life as drawing to a close, but we have seen no mention of his death in the scanty sources of Russian literary biography.

GLINKA, THEODOR NIKOLAEVICH, a Russian poet and military author, was born at Smolensk in 1788; was educated in the institution for cadets; became an officer in the army in 1803, and took part in the Austrian campaign of 1805, but afterwards left the service, and lived on his estates, giving up his time to literature, and occasionally travelling about Russia from motives of curiosity. In 1812 he was roused from his repose by the approach of Napoleon's invading army to his village, put himself on horseback, and joined the Russian forces, where, after the battle of Tarutino, he was appointed adjutant to Miloradovich, and continued in active service till the end of the campaign of 1814. He was afterwards suspected of too liberal tendencies, and for a time banished to Petrozavodsk, but continued President of the Society of Friends of Russian Literature. Glinka's poems chiefly consist of war-songs written on his campaigns, and remarkable for a

fiery energy which made them favourites with the soldiers. His contributions to the military journals are in high repute, but his chief and most interesting work is his 'Pisma Ruskago Ofitsera,' or 'Letters of a Russian Officer,' in eight small volumes, Moscow, 1815-16. This contains his impressions of the countries he passed through under the singular circumstances of the victorious advance of the Russians against Napoleon—the description of a battle alternating with criticism on the paintings of Rubens and observations on manners and scenery. Glinka, if still alive, has been for some time not before the eyes of the public.

GLISSON, FRANCIS, was born in 1597 at Rampisham in Dorsetshire; was admitted at Caius College, Cambridge, of which he became Fellow; and after having graduated in medicine, and been elected a Fellow of the College of Physicians, was appointed professor of physic in the University of Cambridge, which office he held for about forty years. He was also president of the College of Physicians. His writings show marks of considerable power and originality of mind, and contain some valuable information both in anatomy and physiology; but from his ideas having been obscured by the language of the Aristotelian philosophy, they have not met with that attention which they deserve. In 1654 he published an account of the anatomy of the liver, in which he described that prolongation of the cellular tissue, since called the 'capsule of Glisson,' which enters the substance of the liver together with the vena porta and hepatic artery, and accompanies their subdivisions to the ultimate lobules of which the organ is composed. He anticipated Haller in pointing out that property of muscular fibre to which that physiologist gave the name of irritability, for he argues "motiva fibrorum facultas nisi irritabilis foret vel perpetuo quiesceret vel perpetuo idem ageret." He distinguished accurately between perception and sensation, and gave as an instance of the former the action of the heart under the stimulus of the blood, or when removed from the body (that is to say, when stimulated by pricking, pinching, galvanism, &c.), and of the voluntary muscles when excited after death. He maintained that it was only through the medium of this natural irritability, and not directly, that motions were produced under the influence of the will; that the sensation of any external object is produced by an impression upon the natural perception of the organ, and that this impression is conveyed by the nerves to the brain. Thus light produces an impression on the retina, which is conveyed by the optic nerve to the brain, and causes that sensation which we call light. That this view is correct is proved from the fact, that any stimulus applied to the retina produces the same sensation. In each instance we perceive the reaction of the retina under the external irritation.

Glisson noticed the fact, that when any part of the body is stimulated or thrown into action, those parts which derive their nerves from parts of the brain and spinal cord near to those from which the stimulated part derives its nerves, are frequently thrown into action also; and he correctly explained this phenomenon by reference to the contiguous origins of their nerves. This view approaches nearly to that now known by the name of the reflex function of the spinal cord.

Glisson described, as it would seem from his own work for the first time, the disease called the Rickets, which, as he states, made its appearance about thirty years before the date of his work (1650), in the counties of Dorset and Somerset, and by degrees spread to London, Cambridge, and Oxford, and the southern and western parts of England, but had scarcely then reached the northern parts of the island. He named the disease Rachitis (*ραχιτις*), in imitation of the popular name it had obtained before it was described by any medical writer.

His principal works are:—'Treatise on the Rickets,' by F. G., 1650; 'The Anatomy of the Liver, with some Preliminary Remarks on Anatomy, and some Observations on the Lymphatic Ducts,' London, 1654; 'Tractatus de Ventriculo et Intestinis, cui præmittitur alius de partibus continentibus in genere et in specie de iis Abdominis,' London, 1677. They are all written in Latin.

GŁOSKOWSKI, a Polish poet of the 17th century, is the author of a religious poem entitled the 'Watch of the Passion of our Lord,' which, notwithstanding its rather odd title, is written in beautiful verse. It derives its name from being divided into twenty four parts, called hours. It has gone through several editions, and is still much esteemed among the Protestants of Poland. He wrote also a poem in Latin entitled 'Geometria Peregrinans.'

GŁOUCESTER, ROBERT OF. [ROBERT OF GŁOUCESTER.]
GŁOUCER, RICHARD, was born in the city of London, in 1712. His father was a Hamburg merchant, and being intended for the same employment, the son received only a common school education. He possessed however a natural love of letters. At sixteen, he wrote a poem on the memory of Newton; and at an early age commenced his 'Leonidas,' an epic poem on the Persian War, published in 1737, in nine books, and afterwards enlarged, in 1770, to twelve. Being supposed to have a political tendency, it was warmly praised by Lord Lyttleton, Fielding, and the court of the Prince of Wales, and in a few years ran through six or seven editions; but its reputation, like that of most things which are unduly elevated by external circumstances, had sunk to perhaps below its proper level. A sort of continuation of the history of the Persian war, called the 'Athenais,' in thirty books, was published posthumously in 1787. 'London, or the Progress of Commerce,' and the song called 'Hosier's Ghost,' were written to

rouse the nation to a Spanish war. The latter is a fine effective ballad, and possesses the best proof of merit—it answered its end. It will probably be read and remembered long after 'Leonidas' is forgotten.

Mr. Glover took an active part in city politics as an opponent of Walpole. In 1760 he became M.P. for Weymouth, and proved himself a good speaker and a valuable man of business in commercial affairs. He died in 1785.

GLUCK, CHRISTOPH, was born of humble parents, in the Upper Palatinate, on the borders of Bohemia, in 1714. When very young he lost his father, and was totally neglected; but the genius for music, so common in the natives of his country, was in him more than ordinarily vigorous; and, self-taught, he contrived by his talents to work his way to Vienna, where his industry furnished him with the means of procuring not only subsistence but education. He there obtained the patronage of a nobleman, who took him into Italy, and at Milan he received some most valuable instructions from the celebrated theorist Padre Martini. Having successfully given birth to two or three operas, his reputation spread abroad, and Lord Middlesex, then dictator of the King's Theatre, engaged him as his composer. But the rebellion of 1745 had just broken out, and all foreigners were regarded with suspicion, the theatre therefore was, by order, closed, and only reopened by the influence of the noble manager, who conciliated government by a *pièce de circonstance*, a demi-political drama, entitled 'La Caduta dei Giganti' (the Fall of the Giants), set by Gluck as his introduction to a British public. It however excited little interest; the dancing of Madlle. Violetta (afterwards Mrs. Garrick) in this made more impression than the music. In the following year he composed another opera, 'Artamene,' and brought out a Pasticcio, but with no marked success. He then returned to Italy, where he formed an intimacy with Calzabigi, the poet, and the two concerted a reform of the Italian opera, which was carried out in the instances of 'Orfeo' and 'Alceste,' both of which were produced at Vienna, 'Orfeo' in 1764, 'Alceste' in 1769. By these he acquired so high a reputation, that he was invited to compose an opera for the French *Académie Royale*. For this he wrote his 'Iphigénie en Aulide,' which was brought out at Paris, under his own direction, in 1776, and completely triumphed over the national prejudices opposed to it; but not without a violent struggle, in which the unfortunate Marie Antoinette, who had been Gluck's pupil, took an active part in favour of the German stranger. He was now hailed as the reviver of that music which had wrought such miraculous effects in ancient Greece, and the native French composers were cast into the background: when the Italian party, aroused by the success of what they called the barbarous Telescan school, invited to Paris the idol of Naples, the justly-celebrated Piccini. A furious musical war now broke out in the capital of France, and was carried on with a violence never before or since equalled, and which only could have been supported by a people so alive to whatever relates to the arts immediately connected with the theatre. The most eminent of the French literati engaged with extraordinary zeal in the contest, and were nearly equally divided. To such a length was the dispute carried, that it has been said no two persons met in society without inquiring to what party each belonged:—*Êtes vous Gluckiste ou Picciniste?*—the reply determining whether the conversation should have an amicable or a hostile bearing.

Besides the above-mentioned operas, Gluck produced several others, the best of which are 'Armide,' 'Iphigénie en Tauride,' and 'Echo et Narcisse.' He returned to Vienna in 1784, and shortly after was attacked by paralysis, which terminated his life in 1787. As a composer Gluck unquestionably possessed a powerful and original mind. Nothing from his pen betrays the slightest attempt to imitate, or in any way unduly profit by, the works of others. His melodies are beautifully tender, and rarely, if ever, assume any appearance of gaiety. Indeed, passion is the characteristic of his, as well as of most German dramatic music. His choruses are marked by that simplicity which, in his opinion, as well as in that of many able critics, is so conducive to effect on the stage; and his orchestral accompaniments are as remarkable for their appropriateness as for their richness, the period at which they were written being considered. Gluck was, in a word, an intellectual composer, of which fact his works afford incontestable proofs; as well as the originator of a new and superior style of opera music.

GMELIN, JOHN FREDERICK, was born at Tübingen in 1748, where he studied, and took a doctor's degree in 1769. He early devoted himself to the study of natural history, and, after finishing his education, and travelling through Holland and England, he returned to Tübingen, where he principally occupied himself with giving lectures on natural history and botany. He there acquired sufficient reputation to be admitted among the members of l'Académie des Curieux de la Nature; and in 1775 he was appointed professor extraordinary of medicine at Tübingen. He afterwards received the same appointment at Göttingen, which he held till his death, in 1804. During the thirty years of his academical career he published numerous works, which show the extent and variety of his knowledge and learning, but do not say much for his talents or judgment. His most important works are his historical compilations or dictionaries; but he is best known as the editor of the thirteenth edition of the 'Systema Naturæ' of Linnæus, which was first published at Leipzig, in nine parts, 8vo, between the years 1788 and 1793. It is divided into three

tomes, one to each kingdom, and is furnished at the end with alphabetical and polyglot tables of the systematic and trivial names. Cuvier very correctly describes it as being "executed without judgment: an ignorant compilation, useless to the professor, and more likely to mislead the student than to enlighten or instruct him."

This work however though badly arranged, devoid of criticism, and showing the author's ignorance of the different species which he describes, yet possesses some value as being the only book which includes all the objects of natural history which had been described up to the year 1790. Gmelin wrote numerous works and papers on botany and chemistry. A list of his writings is given in the 'Biographie Universelle,' and in the 'Biographie Médicale' of the 'Dictionnaire des Sciences Médicales,' whence this notice is principally taken.

GMELIN, JOHN GEORGE, born at Tübingen in 1709, applied himself to the study of natural history and chemistry, in which he became distinguished. On going to St. Petersburg he was made a member of the Academy of Sciences of that capital. In 1733 he was sent by the Empress Anna to explore Siberia, in company with G. F. Müller and other men of science. This very laborious and interesting expedition lasted nearly ten years. Gmelin examined those vast and dreary regions as far as the banks of the Lena. His object was to proceed to Kamtchatka, but the state of his health and other difficulties made him retrace his steps to St. Petersburg, where he published his 'Flora Sibirica,' 4 vols. 4to, 1747. Having returned to his native country, he was made professor of botany and chemistry at Tübingen, where he died in 1755. His 'Travels' ('Reise durch Sibirien') were published at Göttingen in 1751. Gmelin was one of the first explorers of the northern part of Asia. A genus of Asiatic plants was named Gmelina by Linnæus, in honour of J. G. Gmelin.

GMELIN, SAMUEL GOTTLIEB, nephew of John George Gmelin, was born at Tübingen in 1744, studied in that university, where he applied himself chiefly to the natural sciences, and took his degree of M.D. In 1767 he went to St. Petersburg, and in the following year he was sent by the Empress Catherine on a scientific tour through the southern provinces of Russia. He first visited the banks of the Don, or Tanais, down to Tscherkask, the capital of the Don Cossacks, whence he proceeded to Astrakhan in 1769, and examined the banks of the Wolga and the delta of that river. In 1770 he sailed on the Caspian Sea, explored its western coast, visited Derbend and Baku, and the mouths of the Koor, and wintered at Enzely. In the following year he continued his tour along the southern coast, visited the Persian provinces of Ghilan and Mazanderan, and then returned to Astrakhan, where he prepared the narrative of his journey for the press. He next visited the colony of Sarepta, and crossed the Kooman steppes to Mosdok. In 1773 he again left Astrakhan, for his second and last voyage on the Caspian, and after exploring several parts of the Persian coast, he left his ship at Enzely, and proceeded, in January 1774, by land, to Baku, and thence to Derbend. Being peremptorily ordered away by the khan, or governor of that place, he endeavoured to reach by land Kisliar, the nearest Russian settlement on that side, but was seized on the road by a party of the Kaitak tribe, whose khan Usmey confined him in a prison at Achmetkent, in the mountains of the Caucasus, where he died of ill-health and bad treatment, in June 1774. The Empress Catherine provided for his widow. His travels, 'Reise durch Russland zur untersuchung der drey Natur Reiche,' in 4 parts, with numerous plates, were published at St. Petersburg. The last volume contains a biographical notice of the author. Gmelin wrote also 'Historia Fucorum,' and made other contributions to natural history.

GOBELIN, GILLES AND JEAN, brothers, who introduced from Venice into France, in the reign of Francis I., the art of dyeing scarlet, and established extensive workshops for the purpose upon the small river Bièvres, in the Faubourg St. Marcel of Paris, at Gentilly. Here the brook takes the name Gobelins from the manufactory.

The project was considered at that time by the rival dyers of the metropolis to be so hazardous, that it was called 'Folie Gobelin;' but by the brilliancy and solidity of the colours produced, the Parisians soon became astonished to such a degree that they said Gobelin had made a compact with the devil.

In the year 1677 Colbert purchased the dye-houses from the Gobelin family, in virtue of an edict of Louis XIV., styled it the 'Hôtel Royal des Gobelins,' and established on the ground a great manufactory of tapestry, similar to that of Flanders. The celebrated painter Le Brun was appointed director-in-chief of the weaving and dyeing patterns. Under his administration were produced many magnificent pieces of tapestry, which have ever since been the admiration of the world; such as Alexander's battles, the four seasons, the four elements, and the history of the principal events in the reign of Louis XIV. The works have ever since been carefully fostered by the French government.

GODEFROY. [GOTHPREDUS.]

GODEFROY OF BOUILLON. [BOUILLON.]

GODFREY, THOMAS, was born in the city of Philadelphia, where he carried on the business of a glazier. His attention having been accidentally directed to the study of mathematics, he seems to have devoted himself to it with great ardour and perseverance; and in order that he might read the 'Principia' and other mathematical

works written in Latin, instructed himself in that language. James Logan, who had some reputation as a mathematician, having treated him with kindness and lent him books, he presented to that gentleman in 1730 a paper describing an improvement of the quadrant. In 1732 Logan wrote a letter to Dr. Halley, in which he gave an account of Godfrey's invention, but no answer was returned. Meantime, in 1731, Mr. Hadley had communicated to the Royal Society of London a paper in which he described an improvement of the quadrant similar to that of Godfrey. The claims of both parties were afterwards investigated by the Royal Society, and it was decided that they were both entitled to the honour of the invention. The value of 200*l.* was sent to Godfrey by the Royal Society, not in money, but in furniture, on account of his intemperate habits. The instrument however is still known by the name of Hadley's quadrant. Dr. Benjamin Franklin says—"I continued to board with Godfrey, who lived in part of my house with his wife and children, and had one side of the shop for his glazier's business, though he worked but little, being always absorbed in mathematics." He died in 1749.

Godfrey had a son, Thomas, who died in his 27th year. He wrote some poems, and is distinguished as the author of the first drama written by an American; it is a tragedy, called 'The Prince of Parthia.' (*Encyclopædia Americana.*)

GODOLPHIN, SIDNEY GODOLPHIN, EARL OF, was a younger brother of a family said to have been settled at Godolphin, or, as it was anciently called, Godolcan, in Cornwall, before the Norman conquest. His father was Francis Godolphin, who was made a Knight of the Bath at the Coronation of Charles II., 23rd of April 1661. The date of Sidney Godolphin's birth is not stated, but he was very young when he was first introduced in (1645) to Charles II., then Prince of Wales, and acting as general of the royal army in the west of England. On the Restoration he was brought to court, and appointed one of the grooms of the bedchamber. The first political business in which we find him employed was the management of a confidential correspondence between the Duke of York (afterwards James II.) and the Prince of Orange (afterwards William III.) in the beginning of the year 1678, the object of which was to unite England and Holland in a war against France. (See Appendix to Sir John Dalrymple's 'Memoirs of Great Britain and Ireland,' pp. 144—156.) The duke's anti-gallican zeal soon cooled, and the projected war never took place, but Godolphin's services were rewarded the following year by his appointment (26th March 1679) as one of the Lords of the Treasury. In this office he soon acquired much reputation for ability and habits of business, and he also ingratiated himself so greatly with the king, that on the dismissal, in September 1679, of the Duke of Monmouth and Lord Salisbury, he was, along with Lord Viscount Hyde (afterwards Earl of Rochester) and the Earl of Sunderland, entrusted with the chief management of affairs. Godolphin remained in power when Sunderland was dismissed in 1680, and went along with the king and the other ministers in the disgraceful secret negotiations entered into in 1683 with Louis XIV., for a renewal of the former dependent connexion of Charles with the French king. On the 14th April 1684, he was transferred from his seat at the treasury-board to be one of the principal secretaries of state; but on the 9th September of the same year he was brought back to the treasury and placed at its head, having the day before been ennobled by the title of Baron Godolphin of Rialton, in the county of Cornwall. On the accession of James II., although his conduct in regard to the exclusion bill, a few years before, had not manifested much zeal for the interest of that prince, he was continued in office, but only in a subordinate place at the treasury-board. The letters of Barillon, the French ambassador, however, represent him as one of the chief of the confidential advisers of the new king, and as taking an active part in the negotiations which were immediately opened for continuing the same system of pecuniary obligation to France, and entire subservience to that power, which had been established in the latter part of the preceding reign. During this short reign he also held the office of chamberlain to the queen. After the Prince of Orange had landed in England, Godolphin was sent to negotiate with him on the part of King James, along with the Marquis of Halifax and the Earl of Nottingham; the commissioners submitted their proposals to his highness at Hungerford in Berkshire, on the 7th of December, and having received his answer returned with it to the king. Godolphin however had long been connected with the Prince of Orange, and on the establishment of the new government he was continued as one of the lords of the treasury, to the great grief, according to Tindal, of the Earl of Monmouth (afterwards Earl of Peterborough), the first lord, and Lord Delamere (afterwards Earl of Warrington), the Chancellor of the Exchequer, "who soon saw," says the historian, "that the king considered him more than them both; for, as he understood the treasury business well, so his calm and cold way suited the king's temper." He was left out of the new commission issued 18th March 1690, when the king took an opportunity of dismissing Monmouth and Delamere; but this was merely a temporary arrangement, and on the 15th November following he was appointed first lord. He held this situation till May 1697, when, in one of those adjustments by which King William was constantly modifying his cabinet with the view of preserving the balance of parties, he was replaced by Mr. Charles Montagu (afterwards Earl of Halifax). At this time Godolphin was

looked upon as one of the tory party, and when a strong detachment of that party was brought into the ministry through the medium of the Earl of Rochester, in the end of the year 1700, he was recalled and again placed at the head of the treasury. He again went out with his friends about a year after, but his exclusion this time did not last long. The accession of Queen Anne in March, 1702, was immediately followed by the first exclusively tory administration that had existed since the Revolution; and on the 5th of May, Godolphin was made lord-high-treasurer, being the first person who had held that eminent office since the Restoration. He was in great part indebted for the importance which he now acquired to his intimate connection with the Earl (afterwards the great Duke) of Marlborough, whose eldest daughter and successor in the dukedom afterwards married the son and heir of the lord-treasurer. The attachment of the queen to Marlborough's wife, the celebrated Duchess Sarah, opened for the duke at this moment the door to favour and power; but, as Tindal observes, neither Godolphin nor Marlborough himself would have obtained so great a share of the royal regard and confidence, if they had not been considered to be tories.

Godolphin, who was created Viscount Rialton and Earl of Godolphin, 29th of December 1706, having also in 1704 been made a knight of the garter, continued to hold the office of lord-high-treasurer, and as such to take the chief part in the direction of affairs, till the interest of the Duke and Duchess of Marlborough was effectually supplanted by that of Mrs. Masham and Harley in 1710. From the first however both Marlborough and Godolphin had taken a moderate course, and the latter especially continued to approximate more and more towards the whigs, as that party acquired strength in the country and in the House of Commons. From about the beginning of the year 1706, Godolphin is to be considered as having openly attached himself to the whig party. Soon after this a struggle for the chief power commenced between him and Harley, which was put a stop to for a time by the queen's reluctant dismissal of Harley, on the distinct declaration of Godolphin and Marlborough that they would leave her service unless that step were taken, but the contest was not terminated by that ejection of one of the two rivals from the cabinet. Harley did not rest till, taking advantage of the ferment excited in the public mind in the summer of 1710, by the conduct of the ministry in the case of Sacheverel, he succeeded in emboldening the queen to venture upon the measure for which his intrigues had long given her a vehement inclination. The premier Godolphin was suddenly and rudely dismissed on the 8th of August: it is affirmed that the letter intimating the queen's commands was sent to him by the hands of a livery servant. He survived his loss of power about two years, having died on the 15th of September 1712. Lord Godolphin left an only son, Francis, on whose death, without any surviving male issue, in 1766, the titles became extinct. A new barony however of Godolphin of Helston, which had been granted to this Francis in 1735, was inherited by Francis Godolphin, the son of his uncle Henry; but on his death in 1785 it also became extinct.

GODOONOFF. [GODUNOV].

GODUNOV, or GODOONOFF, BORIS, czar of Moscow, was born in 1552, of a noble family of Tartar descent. Having married the daughter of Maloota Skooratoff, a favourite of the czar of Moscow, Ivan Vassilevich the Terrible, he was attached to the court of the czar at the age of twenty-two, where he soon distinguished himself by such prudent conduct that, although in favour with the tyrant, he avoided taking the least part in the cruelties which disgraced that reign, and of which his own father-in-law was the principal agent. The marriage of his sister Irene with the heir of the throne, Prince Fedor, in 1580, increased his influence, and, in 1582, he was nominated by Ivan Vassilevich one of the five members of the supreme council of state, and became the first favourite of Ivan's successor, Fedor, who threw all the burthen of the government upon him. He received the highest titles that a subject could attain, and such enormous estates that his fortune amounted to 150,000*l.* a year.

Fedor had no children, and his wretched state of health gave no prospects of his having any; but he had a brother called Demetrius, sprung from Ivan Vassilevich, by a seventh marriage, who was, at the time of his father's death, two years old. This infant prince was sent with his mother to the town of Uglich, where they lived in a kind of honourable exile.

Godunov ruled the empire in the name of Fedor with an absolute sway. The country was satisfied with the wisdom of his administration, and he conciliated the friendship of foreign powers. The court as well as the first officers of the empire were filled with his creatures, and all attempts to overthrow him were repressed and severely punished. Yet this grandeur was held by a very precarious tenure, the life of a monarch weak in mind and body. In 1591 the young prince died however under the circumstances described in the article DEMETRIUS, vol. ii. col. 550. Under the supposition that the young prince had been murdered, the inhabitants of Uglich, where the prince resided, rose against certain members of the prince's household, who it was reported had been suborned by Godunov, and massacred them. Godunov sent a commission to investigate this affair, who declared that the young prince committed suicide in a fit of madness, and that the individuals who were massacred by the inhabitants of Uglich as the murderers of the prince were innocent. Fedor was satisfied with this

report, and the public voice, which imputed this crime to Godunov, was silenced by the terror which he inspired, and which was increased by the punishment inflicted on those inhabitants of Uglich who had massacred the assassins of Demetrius. About two hundred of them were put to death, many had their tongues cut out, many were imprisoned, and the greater number transported to Siberia, where the new town of Peleen was peopled with them. The ancient city of Uglich, which had contained 30,000 inhabitants, became a deserted ruin. All those who had incurred any suspicion of having accused Godunov were punished in the most barbarous manner.

Godunov however was no less anxious to reward his adherents and to gain new ones than to overawe his enemies. Whoever applied to him was sure of protection. Many who had deserved punishment were pardoned, and the documents which certified these acts of grace always declared that they were due to the intercession of Godunov; but his name never appeared in the decrees of condemnation, where it was always declared that "the punishment was ordered by the boyards —," naming particular persons. His ambitious views however seemed on the point of being frustrated by the pregnancy of the tsarina, who bore a daughter in 1592; but the infant princess died the following year.

Fedor died in the beginning of 1598, and with him ended the dynasty of Ruric in the direct line, although there were collateral branches which had become private families. The czar, by his last will, bequeathed the throne to his widow Irene, who was immediately proclaimed sovereign; but after a few days she retired to a convent, and declared her firm resolution to take the veil. When all entreaties that she would retract this resolution were fruitless, a universal acclamation proclaimed her brother Godunov as the only man capable of filling the vacant throne of Moscow. A deputation, headed by the patriarch, proceeded to Godunov to announce his elevation to the throne, but he decidedly refused it, and remained unmoved by all their entreaties.

Upon this a general assembly of the states, composed of the principal persons among the nobility and clergy, as well as of the deputies from several towns, was convoked at Moscow six weeks after the death of Fedor, in order to elect a new monarch. The affairs of the state were in the meantime conducted by a council of boyards in the name of the tsarina. Disobedience to the supreme government and disorders consequent on it manifested themselves in different towns. Every person feared the dangers of anarchy, and felt that there was only one man who could prevent them. The assembly of the states, which met at Moscow on the 17th of February 1598, consequently unanimously proclaimed Godunov czar of Moscow, and for two days public prayers were made that Godunov might be induced to accept the throne. On the 20th of February, Godunov, who remained all this time with his sister at a convent in the environs of Moscow, was apprised by a deputation that he was elected sovereign by all the empire; but he still decidedly refused the proffered crown. On the second day the patriarch, accompanied by the principal clergy and nobility, entered the church of the convent, which was surrounded by almost the whole population of Moscow. The patriarch, having performed divine service, requested Godunov to accept the throne; but as he continued to refuse, the patriarch went to the cell of the widowed tsarina with several nobles and bishops, who prostrated themselves before her, while all the population assembled within and without the walls of the monastery did the same at a given signal, crying out that Boris should have mercy upon them and accept the throne. The patriarch with tears implored the tsarina to induce her brother to comply with their wishes. The tsarina, who had remained for some time inexorable, declared at last that, touched by the distress of the nation, she gave her benediction to her brother as the sovereign of Moscow. Godunov still continued to refuse, but when his sister positively insisted on his accepting the throne, he said, with an appearance of the greatest humility, "The will of God be done," and seemed rather resigned to make a sacrifice than to accept the highest worldly dignity. Godunov ascended the throne with the acclamations and the universal joy of the nation; he fully justified the hopes of the people, and proved himself worthy of the supreme power.

Before his coronation a rumour was circulated that the khan of the Crimea was on the point of invading the country. Godunov instantly took the field with such an imposing force that the khan, instead of attacking him, sued for a continuance of peace. A new lustre was added to his reign by the final subjugation of Siberia, which was accomplished about that time.

Godunov was particularly anxious to extend the relations of Moscow with foreign powers, and it was a favourite scheme of his to establish a matrimonial alliance between his own family and some reigning house of Europe. He accordingly directed his attention to Gustavus, son of Eric, the deposed king of Sweden, an accomplished prince, who, having long wandered in many countries of Europe, was then living at Thorn, in Polish Prussia. Gustavus was received with great honours; rich presents and extensive estates were given to him, the czar intending to make him sovereign of Livonia and his son-in-law; but unwilling to become a tool of the Muscovite policy against Sweden, Gustavus soon fell into disgrace. His wealth was taken from him, and after having been imprisoned for some time and partly restored to favour, he was finally exiled to the town of Kashin (in the

present government of Tver), where he occupied himself with chemical experiments till his death in 1607. Disappointed in this project, Godunov proposed an alliance between his daughter Xenia, a princess of great beauty, and the Duke John, brother of the King of Denmark and of the queen of James I., of Great Britain. This proposal was assented to by the king and by the duke; but the duke's premature death before the marriage again marred the ambitious schemes of Godunov.

Among the other relations of Godunov with foreign powers, we may mention his frequent but desultory negotiations with Austria about a league against the Turks. Some negotiations with Persia on the same subject had no more successful result; and an attempt to fix the dominion of Moscow in the Caucasian countries in 1604 also failed. There was a close connection with England during Godunov's reign, and Queen Elizabeth proposed to him, in 1603, a marriage between his son and a young English lady of rank, then only eleven years old. During this reign the merchants of Lübeck received commercial privileges from him equal to those of the English in Russia. Godunov, who was anxious to civilise Russia, conceived the plan of establishing universities, where the young Muscovites should be instructed in foreign languages and the sciences. For that purpose he sent to Germany a native of that country, named Cramer, in order to choose teachers for the intended schools. This project failed through the opposition of the clergy, who considered the measure as an innovation dangerous to religion. He sent however eighteen young men of noble families to be educated in Germany, England, and France. He was also anxious to attract all foreigners who could promote the civilisation of his country, such as physicians, engineers, and artificers. He was also fond of conversing with foreigners, and had great confidence in them, which was fully justified by the conduct of his foreign guards, who remained faithful to his family to the last. He introduced many wise measures of administration, and never committed any unnecessary act of cruelty. In his policy he constantly leaned rather towards clemency than severity. The first two years of Godunov's reign were the most fortunate that Muscovy had ever witnessed; but untoward events soon followed. Some boyards were accused by their slaves of being ill disposed to the sovereign, who punished them by confining them in convents and exiling them to distant places. The bad harvests of 1601 and 1602 produced a general famine, the horrors of which, as described by eye-witnesses, seem almost incredible. Godunov exerted himself to alleviate this terrible calamity, and proved himself in this emergency the real father of the nation. This calamity produced a general disorganisation, and bands of robbers infested all the country. Their chief, called Khlopko, rendered himself so formidable that it was necessary to send an army against him. He was defeated and taken in a regular battle not far from Moscow, in which the commander of the czar's forces was killed. The robbers however continued to infest particularly the border provinces, and their number was increased by Fedor's ordinance establishing slavery. In 1604 a rumour began to be circulated that Prince Demetrius, who was believed to have been murdered at Uglich, was alive, and making preparations in Poland to recover the throne of his ancestors. However this may be, he found many partisans in Poland, levied an army, and entered Russia, where, after some reverses, he obtained complete success. Town after town submitted to him, and he was joined by the armies sent to oppose him. He was in full march on Moscow when Godunov suddenly died on the 13th of April 1605, under a strong suspicion of having destroyed himself by poison. Godunov was one of the most remarkable princes recorded in history. In his abilities and vigour of character he resembled Peter I. His son Fedor, a youth of eighteen years of age, who is described as endowed with the most amiable qualities, received the oath of fidelity of all that part of the empire which was not under the domination of Demetrius. His reign was however of short duration, for on the 13th of June a riot took place at Moscow; he was dragged with his family from the palace, and shut up in a house which was his private property, where he was murdered a few days afterwards. [DEMETRIUS.]

GODWIN, FRANCIS, son of Thomas Godwin, bishop of Bath and Wells, was born at Havington, in Northamptonshire, in 1561. He was elected student of Christchurch College, Oxford, in 1573, while his father was dean; became B.A. in 1580, M.A. in 1583, B.D. in 1593, and D.D. in 1595. His earliest preferments were the rectory of Samford Orcais, in Somersetshire, and the vicarage of Weston in Zoyland, in the same county; he was also collated to the sub-deanery of Exeter in 1587. Afterwards, on the resignation of the vicarage of Weston, he became rector of Bishop's Liddiard. His favourite study was the ecclesiastical biography of his country, his collections for which he published in 1601, under the title of 'A Catalogue of the Bishops of England since the first planting of the Christian Religion in this Island; together with a brief history of their lives and memorable actions, as near as can be gathered from antiquity.' It was dedicated to Lord Buckhurst, who, being in high credit with Queen Elizabeth, immediately procured him the bishopric of Llandaff. He published another edition of this catalogue in 1615, with great additions; but partly in consequence of the errors of the press which it contained, and partly to please James I., who was now on the throne of England, he put it into a Latin dress in the following year, dedicating it to the king, who in return gave him the bishopric of

Hereford, to which he was translated in 1617. The Latin 'Catalogue' was reprinted, with a continuation to the time of publication, by Dr. William Richardson, folio, Cambridge, 1743.

In 1616 Bishop Godwin published a folio volume, entitled 'Rerum Anglicarum Henrico VIII., Edwardo VI., et Maria Regnantibus Annalee,' which his son Morgan Godwin translated and published in English, fol. 1630. Other editions of the Latin were, 4to, London, 1628, and 12mo, Hag., 1653. In 1630 he published a small treatise entitled 'A Computation of the value of the Roman Sesterce and Attic Talent.' This was the latest of his productions. He died in the month of April 1633.

Exclusive of the above-mentioned works, he wrote two pieces of a different kind, one of which, in Latin, partook of a scientific character, entitled 'Nuncius Inanimatus in Utopia,' 8vo, 1629, the design of which was to communicate various methods of conveying intelligence secretly, speedily, and safely. It is supposed to have given rise to Bishop Wilkins's 'Mercury, or Secret and Swift Messenger.' The other was a posthumous work of imagination, written while he was a student of Christchurch, celebrated in its day, and even not yet forgotten, entitled 'The Man in the Moon, or a Discourse of a Voyage thither by Domingo Gonsales,' 8vo, 1638. To a later edition of this work, in 1657, a translation of the 'Nuncius Inanimatus' was appended by Dr. Thomas Smith, of Magdalen College, Oxford.

GODWIN, GEORGE, architect, editor of the 'Builder,' and author of numerous papers in that journal and other works on architecture and collateral subjects, was born on the 23rd of January 1815, at Brompton, Middlesex. His father, Mr. George Godwin, sen., still resident at Brompton, has practised during many years as an architect and surveyor in the growing suburbs of Western London, where Godwin, jun., had the opportunity of practical experience from the early age of thirteen, when he entered his father's office. To the advantages which he derived from industry and self-reliance, he added a love of general literary and scientific pursuits. At twenty years of age he was joint editor of the 'Literary Union,' a miscellany of tales and essays. His first literary work connected with architecture was an essay on Concrete, prepared in 1835, in answer to an advertisement from the Institute of British Architects, and for it he received in 1836 their first medal. The essay, afterwards printed in the 'Transactions' of the Institute, has remained a standard authority, and has been translated into the French and Italian languages. In 1836 and 1837 he was concerned in the getting up of the Art Union of London, to which from the year 1839 he has acted as chief honorary secretary. In 1837 he wrote 'An Appeal to the Public on the Subject of Railways.' In 1838 he commenced 'The Churches of London,' a history and description of the ecclesiastical edifices of the metropolis, in 2 vols. 8vo, with plates from drawings by Mackenzie and Billings. The name of Mr. Britton was appended to the work along with that of Mr. Godwin. From this time Mr. Godwin was a frequent contributor of papers to the meetings of the Institute of British Architects and other societies. In 1839 he was elected a fellow of the Society of Antiquaries, and in the following year a fellow of the Royal Society. In 1840 also, the Société libre des Beaux Arts of Paris awarded him a medal for his published works. At the commencement of the publication (in 1839) of the 'Art Union Magazine' (now the 'Art Journal'), Mr. Godwin was a constant contributor to it; and he also wrote many papers in the early volumes of the 'Civil Engineer and Architect's Journal.' His contributions to journals, or to the societies, included notices of the buildings of Belgium, Normandy, Poitiers, and Angoulême; and his essay on 'Masons' Marks in the Middle Ages' was printed by the Society of Antiquaries in the 'Archæologia.' He also wrote a farce called 'The Last Day,' first played at the Olympic Theatre on October 29th, 1840. In 1844 he published a collection of tales under the title 'Facts and Fancies,' and subsequently he contributed a memoir of Bunyan to the edition of the 'Pilgrim's Progress' which he edited in conjunction with Mr. Lewis Pocock, his colleague in the secretaryship of the London Art Union. This society owes much of its influence to Mr. Godwin's exertions. The annual reports during seventeen years have been prepared by him, and during the years 1845 to 1848, when the existence of the society was threatened, Mr. Godwin's correspondence with the government procured the sanction of an act of parliament and a charter.

Mr. Godwin became editor of 'The Builder' upon the completion of the second volume in 1844. With that journal his literary services to the advancement of architecture, to general art and science, and social and sanitary improvement, thenceforward may be said to be identified. From amongst the mass of valuable contributions furnished by Mr. Godwin's unaided pen, some have been republished in a separate form. A good popular account of the styles of architecture, originally written as a series of letters to a lady, appeared in 1853; and in 1854, under the title of 'London Shadows,' Mr. Godwin issued part of the result of an 'Inquiry,' which he had made in 1853, into 'the Condition of the Homes of the Poor,' similar to what may have been undertaken by others, but treating of facts which had hardly been set forth with the same cogency and truth.

Besides these literary works, Mr. Godwin has designed and erected St. Mary's church, West Brompton; the Infant schools at Redcliff, Bristol, and some farm buildings of an improved construction; he has directed the restorations of the tower of the old church at Fulham,

and of St. Mary's church, Ware; and has had under his care, since the year 1846, the works at the magnificent church of St. Mary, Redcliff, where the north porch, restored in 1855, is one of the most important of the portions of the building now finished. In 1847 the second premium was awarded to Mr. Godwin and Mr. Harris, in the competition for the buildings of the Colney Hatch Lunatic Asylum.

Mr. Godwin has given the aid of his architectural knowledge in the production of some of the plays of Shakspeare at the Princess's theatre, and has delivered many popular lectures on architecture, in London and some of the towns of Scotland. He holds the office of surveyor, under the Metropolitan Buildings Act, to the district of South Islington, to which he was elected in 1853. He was one of the jurors at the Exhibition of 1851, for the class of Mineral Substances used in Buildings, and is a Fellow of the Institute of British Architects, and of several foreign societies.

GODWIN, WILLIAM, was born on the 3rd of March 1756, at Wisbeach in Cambridgeshire, where his father had then the charge of a dissenting congregation. He was placed when eleven years old with a private tutor at Norwich: and when seventeen was sent to the Independent Theological College at Hoxton, with a view to being educated for the ministry. In 1778 he became minister to a congregation in the neighbourhood of London, and continued to officiate in that capacity for five years. At the end of this period he removed to the metropolis, and henceforth sought subsistence by authorship.

The first work which Godwin published with his name was the well-known treatise on 'Political Justice.' It appeared in the beginning of 1793, but sixteen months, as he states in his preface, after its composition was commenced. It appeared at a time when a panic had seized men's minds, and when the government, scared by the progress of events in France, were carrying on prosecutions against such as, by speech or writing, showed, or were thought to show, a disposition to sympathise with the French revolutionary principles. The freshness of tone pervading the treatise on 'Political Justice,' and the novelty and extravagance of many of its views, rendered it likely, under these circumstances, that the author would be exposed to danger, at least so Godwin thought, and he expressed his belief and his resolution to brave the consequences, in a characteristic passage of remarkable dignity. The 'Political Justice' entailed no prosecution upon its author, but it brought much obloquy. Obloquy, displeasing in itself, is however a sure path to notoriety, which, whatever may be its origin or character, is pleasing. The 'Political Justice' imparted to Godwin a great notoriety; and he now rose, as he himself expresses it, "like a star upon his contemporaries." ('Thoughts on Man,' p. 338.) In the year following its publication, he published his novel of 'Caleb Williams,' the ultimate object of which was an illustration of some of the views contained in the 'Political Justice,' and a realisation in the person of Caleb of many complaints contained in the 'Political Justice' of the prevailing state of society, designed to work upon minds for which the disquisitionary character of the latter treatise was unsuited. The success of Godwin as a novelist, added to his previous notoriety as a political writer, raised his fame to its height.

Towards the close of 1794 some of Godwin's chief friends, Holcroft, Horne Tooke, Thelwall, Hardy, and others, were arrested, and brought to trial on charges of high treason. Godwin had himself studiously kept aloof from those societies, which were then the chief object of fear to the government, and as being members of which his friends were arraigned; for however great, nay extravagant, might be the changes which he contemplated, he had always advocated a quiet and gradual mode of attaining them, and avowed himself, whether in writing or conversation, the enemy of revolution. But to his friends in danger he now tendered a valuable assistance. His 'Cursory Strictures' on the charge delivered by Judge Eyre to the jury, which were published instantly in the 'Morning Chronicle,' were thought at the time to have contributed greatly to the acquittal of the accused.

In 1797 he published the 'Enquirer,' a collection of essays on moral and literary subjects. It was in April of this year that he married Mary Wollstonecraft, having, in pursuance of the opinions which he then entertained, and in which she concurred, against the institution of marriage, previously cohabited with her for a period of six months. His wife died in childbirth in September of the same year, leaving Godwin a daughter, who subsequently married the poet Shelley, and who gave ample proofs that she inherited much of the powers of her parents. In 1798 Godwin edited the posthumous works of his wife, and also published a small memoir of her, which is eminently marked by feeling, simplicity, and truth.

The novel of 'St. Leon' was published in 1799. In the course of the next year Godwin paid a visit to Ireland, residing, while in that country, principally with Curran. In 1801 he married a second time. His 'Life of Chaucer,' a work of little research and of no value, appeared in 1803, and was followed the next year by a third novel, bearing the name of 'Fleetwood, or the New Man of Feeling.'

It was about this period of life that Godwin entered into business as a bookseller, and leaving the nobler and more pleasant paths of literature, employed himself for some time in the composition of school-books, which were published under the assumed name of Baldwin. He came forward however in 1808 with his 'Essay on Sepulchres, or a Proposal for Erecting some Memorial of the Illustrious Dead

in all ages on the spot where their Remains have been Interred.' In 1816 he published his fourth novel, 'Mandeville.' In 1820 appeared his 'Treatise on Population,' in reply to Mr. Malthus, whose own 'Essay on Population' had been suggested by Godwin's views of the perfectibility of man, as expounded in the 'Political Justice' and the 'Enquirer.' He afterwards devoted himself for some time to his 'History of the Commonwealth of England,' the four volumes of which appeared successively between the years 1824 and 1828. In 1830, when now seventy-four years old, he published his fifth and last novel, entitled 'Cloudeasley.' In 1831 he published a volume of essays under the title of 'Thoughts on Man,' and in 1834 his last work, the 'Lives of the Necromancers.'

Shortly after the accession of Lord Grey to power, Godwin was appointed to a situation in one of the public offices, which, in his declining years, supplied him with an assistance and a comfort that he needed. He died on the 7th of April 1836, in the eighty-first year of his age.

The name of Godwin, as a writer, is chiefly known in connection with the 'Treatise on Political Justice;' but his best title to fame is derived from his novels. He had neither reach nor precision of thought sufficient to form a good philosophical writer. But though deficient in power of reflection, he possessed a singular skill in observing, and in describing what he observed, which fitted him to portray character. The characters of Falkland, in 'Caleb Williams,' and of Mandeville, are great examples of his skill in this respect; and there are few novels which interest so much as those of Godwin.

MARY WOLLSTONECRAFT GODWIN, the first wife of William Godwin, better known however by her maiden name of Wollstonecraft, was born on the 27th of April 1759. Mary Wollstonecraft's early years were spent in the country, but whether in Norfolk or at Beverley in Yorkshire, is not clear. When she had attained the age of sixteen, her father, having entered into a commercial speculation, removed to Hoxton, near London. Mary Wollstonecraft's early years were not passed happily. Her father appears to have been a man of no judgment in the management of a family, and of a most ungovernable temper. A young woman of exquisite sensibility, as well as of great energy of character, she was thus led early to think of quitting her parents and providing for herself. She went first to live as companion to a lady at Bath, and afterwards, in 1783, in concert with two sisters and also a friend for whom she had conceived an ardent attachment, she opened a day-school at Islington, which was very shortly removed to Newington Green. Mr. Godwin, who is well qualified to give an opinion, speaks in high terms of her pre-eminent fitness for the teaching of children; but the call of friendship having carried her for a time to Lisbon, and the school having been mismanaged in her absence, she found it necessary on her return to give up this plan of subsistence. She almost immediately obtained the situation of governess in the family of Lord Kingsborough.

Mary Wollstonecraft had by this time made an attempt in authorship. She had in 1786 written and published, in order to devote the profits to a work of charity, a pamphlet entitled 'Thoughts on the Education of Daughters.' On leaving Lord Kingsborough's family in 1787, she went to London, and entered into negotiations with Mr. Johnson, the publisher, with a view to supporting herself by authorship. The next three years of her life were accordingly spent in writing; and during that period she produced some small works of fiction, and translations and abridgements of several valuable works, for instance, Seizman's 'Elements of Morality,' and Lavater's 'Physiognomy,' and several articles in the 'Analytical Review.' The profits of her pen, which were more than she needed for her own subsistence, supplied aid to many members of her family. She helped to educate two younger sisters, put two of her brothers out in the world, and even greatly assisted her father, whose speculative habits had by this time brought him into embarrassments. Thus for three years did she proceed in a course of usefulness, but unattended by fame. Her answer however to Burke's 'Reflections on the French Revolution,' which was the first of the many answers that appeared, and her 'Vindication of the Rights of Woman,' which appeared in 1791, rapidly brought her into notice and notoriety.

In 1792 Mary Wollstonecraft went to Paris, and did not return to London till after an interval of three years. While in France she wrote her 'Moral and Historical View of the French Revolution;' and a visit to Norway on business in 1795 gave rise to her 'Letters from Norway.' Distress of mind, caused by a bitter disappointment to which an attachment formed in Paris had subjected her, led her at this period of her life to make two attempts at suicide. But it is a striking proof of her vigour of intellect that the 'Letters from Norway' were written at the time when her mental distress was at its height, and in the interval between her two attempts at self-destruction.

It was at the beginning of 1796 that Mary Wollstonecraft became acquainted with Godwin. The result of their acquaintance has been stated in the preceding article to have been first, in consequence of their own opinions on the subject of marriage, a cohabitation which lasted for about six months, and at the end of that period, in deference to the opinions of the world, a marriage. Mary Wollstonecraft Godwin died in child-bed on the 10th of September 1797, in her thirty-ninth year.

GOES, HUGO VANDER, a celebrated old Flemish painter and pupil of John Van Eyck. He was a native of Bruges according to Van Mander, but of Antwerp according to Vasari, who calls him Hugo d'Anversa. He spent some time in Italy, and after his return to the Netherlands appears to have settled in Ghent. He conducted the festival which was held at Ghent at the inauguration of Charles the Bold as Count of Flanders, on July 27, 1467. In 1473 he painted the decorations for the pope's jubilee; and he was, according to the town archives, frequently employed by the authorities of Ghent down to the year 1480. The cause of his residing in Ghent is conjectured to be a supposed marriage with a beautiful maid of that place, the daughter of a citizen of the name of Jacob Weytens, in an apartment of whose house Vander Goes painted in oil a celebrated picture of 'David and Abigail,' in which he introduced the portrait of the daughter with whom he was in love, beautifully painted: it has been celebrated in verse by Lucas de Heere, but has since perished. Vander Goes seems to have survived his supposed wife, for, probably about 1480, he entered the Augustine convent of Roodendale in the wood of Soignies near Brussels, in which he became a canon; and there he was buried.

There are many extant works attributed by various writers to Vander Goes, but few with certainty: the Museum of Berlin has eight; there are four at Munich, and several at Vienna, and in the Netherlands. Passavant thinks that the two large pictures of 'James IV. of Scotland and his Queen,' with the 'Saints Andrew and George,' at Hampton Court (Nos. 509-510), are by Vander Goes, because they are similar to the pictures at Berlin; but they are much more likely to have been painted by Mabuse, to whom they are attributed, and who was in this country in the reign of Henry VII., James's father-in-law: James also was not married until 1503, when Vander Goes had probably been dead some time.

One of Vander Goes' masterpieces is the 'Crucifixion between the two Thieves,' in the church of St. James at Bruges, which, to preserve it during the iconoclastic rage in the 16th century (1566), was coated with black and inscribed with the ten commandments: it was afterwards cleaned, and still remains.

Vander Goes excelled in painting women, but he appears to have been unequal in his execution. His best works are conspicuous for the beauties of the Van Eyck and old Flemish school—colour and careful execution, with its prim postures and meagre forms.

(Van Mander, *Leven der Schilders*, &c.; De Bast, *Messageur des Sciences et des Arts*, Gand, 1824; *Kunstblatt*, 1826; Passavant, *Kunstreise*, &c.; Rathgeber, *Annalen der Niederländischen Malerei*, &c.)

GOETHE. [GÖTTE.]

GOGOL, NIKOLAY, a Russian author of great celebrity, whose career throws a light on several points of the moral and political state of his country. He was born apparently about 1810, in Malorussia, or Little Russia, the inhabitants of which are distinguished from those of Great Russia by vivacity of character and a comparatively strong feeling of self-respect and independence. They have a language or dialect of their own, about as distinct from that of Russia as the Lowland Scotch from the English, but of which no use is made in serious composition. Gogol was educated at Neghin, at the Bezborodko Lyceum, a provincial high school founded and endowed by one of the Bezborodko family, and one of the few institutions of the kind in Russia which are not directly supported by the public money. On completing his education he repaired to St. Petersburg in search of employment under government, and it is said that his claims were rejected by one of the government offices on the ground that he was insufficiently acquainted with the Russian language. Soon after he published his first work, a collection of short novels and sketches, entitled 'Evenings at a Farmhouse' ('Vechera na Khutorie'). The book became immediately popular, and the charm of the style was compared by Russian critics to that of Washington Irving. It consists of a series of delineations of country life in Malorussia, which are said to be remarkable for their fidelity. It was soon followed by 'Mirgorod,' a supplementary collection of the same character, which met with equal favour. One of the author's habits deserves remark: Gogol, like Dickens, was noted for the excellence with which he read aloud his own productions, and it is said that in composing a dialogue it was his practice to recite all the different speeches in character before committing them to paper, by means of which he ascertained more satisfactorily if they were in complete consonance with what the character and situation required. He soon tried his powers in the drama, and his comedy of 'The Revisor' met with the most brilliant success. A revisor in Russia is the title of a high government officer despatched to a province to ascertain and report on the character of its administration. The plot and the moral of the play is, that an impostor who makes his appearance at a provincial capital, assuming this title, discovers such universal speculation and misconduct among all the government officials, that when he is at last discovered they are glad to let him off scot free and hush up the whole affair. The Emperor Nicholas, who saw the play acted more than once, gave it his marked applause. It was however chiefly popular among the Russian liberal party, who affixed to it a deeper significance than to a foreigner appears altogether just, and considered it an open and serious attack on the institutions of Russia in general. That it was not looked upon in this light by the government seems sufficiently proved by the

appointment of Gogol as professor of history at the University of St. Petersburg, where it was his intention to devote himself to more serious studies. His next work however was another novel, the 'Adventures of Chichagov, or Dead Souls' ('Pokhoshdeniya Chichagova ili Mertvuiya Dushi'), published at Moscow in 1842. The English public has an opportunity of forming an estimate of this, the principal work of Gogol, as an English translation of it appeared in 1854, under the title of 'Home Life in Russia, by a Russian Noble,' falsely declared in the preface to be an unpublished novel, originally written by a Russian in the English language. The style of the English version is indeed remarkably bad, while that of the Russian original is remarkably good; but the main strength of a novel lies in the plot and characters. The hero of the 'Dead Souls,' like the hero of the 'Revisor,' is a daring impostor, who goes about to a number of country gentlemen to persuade them to sell to him the nominal property in their dead serfs, or, as they are technically called in Russia, their 'dead souls,' for the purpose of obtaining an advance from government as the proprietor of a certain number of serfs—the names of the dead not being for a certain period struck off the records. Some of the characters introduced in the tale are certainly sketched with vigour, but in no other production of Russian literature is the foreign reader so much at a loss to detect the charm which has excited the enthusiasm of the native critics. The praises which were lavished on the original may be suspected of having their origin partly in political feelings.

Soon after the appearance of the book which raised his fame to its highest point, the author, whose health was bad, obtained permission to travel abroad, and was still abroad at the time of the publication of 'Select Passages from N. Gogol's Correspondence with his Friends' ('Vuibrannuiya Miasta iz Perepiski s Druziami'), St. Petersburg, 1847, 8vo. From the height of popularity this publication sunk him at once to the lowest depths of contempt. His liberal friends found with surprise that the satirist of Russia, when at home, had become the panegyrist of Russia, autocracy and all, when beyond the frontier. Bielinsky, who was one of the principal, attacked him fiercely in the 'Sovremennik,' one of the leading reviews in St. Petersburg, in an article which could hardly have been expected to pass the censorship. Gogol addressed to him a letter of remonstrance, protesting that the change which had taken place in his opinions was the result of conviction produced by reflection and experience. Bielinsky, who, dying of consumption, had himself obtained permission to leave Russia, addressed to him from his sick bed at Salzbrunn one of the most terribly crushing letters to be found in the whole annals of literature, and which was first printed, with the rest of the correspondence, in the 'Polyarnaya Zvezda,' or 'Polar Star,' a Russian periodical issued in London in 1855. "Yes," exclaims Bielinsky, "I loved you with all the passion with which a man warmly attached to his country, can love its hope, its honour, its glory, one of its great leaders in the path of self-consciousness, development, and progress. You had good cause indeed to be shaken out of your repose of soul, for a minute at least, when you lost the right to such love as this. I do not speak thus because I consider any feelings of mine an adequate recompense for such genius as yours, but because in this respect I do not stand alone, but represent a multitude of whom neither you nor I have ever seen the majority, and who have never seen you." "You," he afterwards bursts out, "you, the author of the Revisor and the Dead Souls,—can you, sincerely and from your soul, raise a hymn of praise to the disgusting Russian clergy, placing it immeasurably above the clergy of the Roman Catholics. Let us suppose you do not know that the latter was sometimes something, while the former was never nothing but the lackey and slave of the secular power; but is it possible you do not know that our clergy stands in the lowest degree of contempt with Russian society and the Russian people. Is not a 'pope' throughout Russia for every Russian the representative of gluttony, meanness, servility, impudence?" . . . "I will not dilate on your dithyrambic about the bond of affection between the Russian nation and its rulers. I will only say that this dithyrambic has met with no sympathy, and has lowered you even in the eyes of persons who in other respects are very close to you in the direction you are taking. I leave it to your conscience to intoxicate itself with the divine beauty of Autocracy; only continue to have the good sense to contemplate it from a reasonable distance,—when near, it is not so beautiful, and is apt to be dangerous." . . . "You placed yourself too high in the opinion of the Russian public for it to be able to believe in the sincerity of such convictions as this. What may seem natural enough in fools cannot seem natural in a man of genius." Bielinsky goes on to accuse him of views of personal emolument, and touches with bitterness on a passage in the 'Perepiski,' in which Gogol had appeared to speak with humility of his own works, and to intimate that he did not share the opinion of their admirers. "These persons," says Bielinsky, "may in their admiration of you have made more noise with their applause than the case required; but after all, their enthusiasm sprung from so pure and noble a source that it was altogether unbecoming in you to surrender them up in the face of their enemies and yours, and to accuse them into the bargain of attributing a wrong meaning to your productions." The reply of Gogol to this bitter diatribe is singular. "God knows," he writes, "there may be some truth in what you say.—One thing appears to me an established truth

—that I do not know Russia—that much has been changed in it since I left, and that I must almost begin to study it anew to know it now. The inference I draw from this for myself is that it behoves me not only not to print new sketches of life, but not even two lines on the subject till I have returned to Russia, have seen it with my own eyes, and touched it with my own hands." Neither Bielinsky nor Gogol ever returned. Bielinsky died in France soon after the Paris revolution of February 1848, which he hailed as the dawn of an era of liberty; and Gogol, whose last letter is dated from Ostend, in August 1847, soon followed him. His death is repeatedly alluded to in recent Russian publications, but we have not seen its real date stated.

GOGUET, ANTOINE-YVES, born at Paris in 1716, followed the profession of the law, and became counsellor to the parliament of Paris. He applied himself closely to literature, and especially to historical studies. The result of his researches appeared in his work, 'Origine des Loix, des Arts, et des Sciences, chez les Anciens Peuples,' 3 vols. 4to, Paris, 1758. The first volume treats of the period from the Flood to the death of Jacob, and the author follows the progress of civilisation among the Assyrians, Babylonians, Egyptians, Phoenicians, and the early Greeks. He investigates—1, their laws and forms of government; 2, the state of their arts and industry; 3, that of their sciences; 4, their commerce and navigation; 5, their military discipline and tactics; 6, their habits and manners. The author has done the most he could with the scanty materials within his reach. The second volume comprises the period from the death of Jacob to the establishment of monarchy among the Hebrews. In this part, besides the above-mentioned nations, the author introduces to view several people of Asia Minor, such as the Lydians and Phrygians, with the states of Greece and the people of Crete; and he follows throughout the same distribution of his subject-matter as in the first volume, into government, arts, sciences, &c. The third volume treats of the period from the establishment of the Jewish monarchy to the time of Cyrus, and upon the same plan as the other two. The work ends with several dissertations on ancient measures and coins, on the astronomical periods of the Chaldeans, and on the antiquities of the Babylonians, Egyptians, and Chinese. Goguet died soon after the publication of his work, leaving part of the materials of another, on the origin and progress of the laws, arts, and sciences in France, from the establishment of the monarchy.

GOLDING, ARTHUR, was born in London, of a good family, at some time in the early part of the 16th century. In 1564 he was living in the house of secretary Cecil, in the Strand; and his dedications show him to have been patronised also by the earls of Leicester and Essex, Lord Cobham, Sir Christopher Hatton, and other men of station in his time. His earliest known work was printed in 1562. After the death of Sir Philip Sidney, in 1584, he completed Sir Philip's translation of Philippe de Mornay's French treatise on the 'Truth of Christianity;' and he must have been alive till 1587, when that translation was published, or perhaps for two or three years longer. The dates of his published writings extend over the whole of the period thus marked out. They amount to about thirty; of which however, besides some copies of verses, one only is original, a religious 'Discourse upon the Earthquake' of 1580. The rest of them are translations, chiefly from the Latin, but some from the French. Several are theological or ecclesiastical works of Calvin, Chytræus, Bishop Grosteste, and others: two or three are historical. But those which were most useful to his contemporaries were his translations from the Latin classics. These embraced, in succession, prose versions of Justin, Cæsar, Seneca, Pomponius Mela, and Solinus, and a spirited and not very unfaithful translation of 'Ovid's Metamorphoses' into fourteen-syllable verse. Four books of the Ovid were published in 1565, and the complete work in 1575. Golding deserves to be commemorated, on account of the great influence which he and other translators of the classics exercised upon the dawning poetry of England.

GOLDO'NI, CARLO, was born at Venice in 1707, of a family originally from Modena. His grandfather, in whose house he was born, was a man of pleasure, fond of the company of musicians and comedians, and young Goldoni early showed a predilection for theatrical performances. He was sent by his father to different colleges, but he repeatedly interrupted his studies by running away with some company of strolling players. Having at last taken his degree of Doctor of Law in the University of Padua, he began practising at Venice as an advocate, but soon left it to resume his rambling life, and engaged himself to a company of actors as stage-poet. After some years he left his companions in 1742, and began practising at Pisa as a lawyer with great success; but the appearance of another dramatic company made him give up his practice, and he engaged himself again as a stage-poet, in which situation he continued for the greater part of his life. From that time he aspired to the honour of being the reformer of the Italian stage. The Italian comedy had from its birth been deficient in originality; it was an imitation, first of the old classic drama, and afterwards of the romantic Spanish plays; and although a few clever writers, such as Machiavelli, Aretino, Bibbiena, Della Porta, and the younger Buonarroti, produced some good specimens both of the classic and the romantic styles, yet, generally speaking, the want of a national drama suited to modern Italian manners was felt, and the stage was given up either to dulness or licentiousness

and absurdity. The melodrama, or opera, introduced by Rinuccini, tended to favour, under the shelter of musical attraction, all sorts of irregularities of plot and action, and it gradually drove the regular comedy from the stage. But there was another species of play which might be styled national, namely, the 'commedia dell' arte,' or 'à soggetto.' These plays were not written; a mere outline of the plot was sketched out, and the various characters being assigned to the actors, each filled up his own part as he chose, the dialogue being for the most part delivered extempore on the spur of the occasion, just like a conversation in private society. It might be called an improvised drama. The principal characters of these plays were fixed, and consisted chiefly of what the Italians called 'Maschere,' because the actors who performed them wore masks; they were a sort of caricature representatives of the native humour and local peculiarities of the people of the various Italian states. Thus, Pantalone was the prototype of a Venetian tradesman, honourable and good-natured even to weakness, with much of the humour peculiar to his country; the Dottore was a Bolognese professor somewhat pedantic; Brighella, a sort of Italian Scapini, was an intriguing rogue of a servant; Harlequin, from Bergamo, was a curious compound of simplicity and waggery; Policinella, a Neapolitan clown, a licentious, pilfering, but humorous knave. Each of these spoke his native dialect, while the other dramatis personæ spoke the written Italian. These generally consisted of an amoroso, or lover, and his mistress, often a couple of each, besides subordinate female characters of pert, shrewd, intriguing servant-maids, with the generic names of Colombina, Smeraldina, Spilletta, &c. The attraction of these plays consisted in their wit and drollery, the quick repartee, the licentious double meaning, and also in the acting of the performers. A few clever actors here and there gave a peculiar zest to the play, and many of these unwritten performances had really considerable merit, but mediocrity was fatal to them, and in most cases these comedies degenerated into mere scurrility and low vulgarity. Goldoni determined to revive the use of regular comedy, and with this view he wrote a vast number of plays descriptive of the life and manners of his countrymen. He had a great fund of invention, a facility of writing, and was an attentive observer of men. He excels in painting the Venetians of his time, jovial, licentious, good-natured, and careless; several of his plays are entirely in the Venetian dialect, and are remarkable for raciness and fluency of diction. His Italian, on the contrary, is far from pure, and the expressions are at times mean. Goldoni, although himself an honourable man, had mixed during a great part of his life with very equivocal company, and the manners which he paints, though real, are not always the best; indeed some of his scenes would not be tolerated on the English or even French stage. Being deficient in general information, whenever he has attempted to sketch foreign manners he has committed blunders. He often wrote in great hurry for bread, as he himself says, being bound to supply his company with a certain number of new plays annually, and at one time he wrote as many as sixteen in one year, a circumstance which may account for the great inequality observable in his compositions. But with all his faults, Goldoni was certainly the restorer, if not the creator, of Italian comedy; his plays continue to be acted with applause; and the best writers of comedy that Italy has produced since his death, such as De Rossi, Giraud, Nota, &c., are confessed disciples of Goldoni. In Goldoni's time the *Commedia dell' Arte* found a powerful defender in Carlo Gozzi, a writer of unquestionable though ill-regulated genius, who was Goldoni's great antagonist, and divided with him the applause of the Venetian public. He wrote some clever parodies of Goldoni's plays. This contest, which made great noise at the time, and is by no means devoid of interest for the history of the Italian mind, is noticed at some length by Ugolini, 'Letteratura Italiana,' article 'Carlo Gozzi,' and also by Baretti, in his 'Account of the Manners and Customs of Italy.'

Goldoni, after many years of a very laborious life, was still poor, when in 1761 he was invited to Paris by the Italian comedians of that city. He there wrote a great number of plays, some of them in French; most of which met with great success. His 'Bourru Bien-faisant' remained a standard play on the French stage. Voltaire speaks of Goldoni with great praise, and paid him very flattering compliments at the time. Diderot borrowed the subject of his 'Natural Son' from one of Goldoni's plays. Goldoni having become known at the French court, was appointed teacher of Italian to the daughters of Louis XV., and after some years a pension of 3600 livres was given to him. He was living comfortably in his old age at Paris when the revolution deprived him of his pension. The Convention however, on a motion of Chenier in January 1793, restored it to him, but he did not live to enjoy the boon, as he died a few days after. His widow was paid the arrears.

Goldoni published an edition of his plays in 18 vols. 8vo, Venice, 1761; but a complete edition of his works was published after his death in 44 vols. 8vo, Venice, 1794-95. Numerous choice selections of his best plays have been and still are published in Italy. He also wrote 'Memoirs of his Life,' in French, in 3 vols.

GOLDSMITH, OLIVER, was born on the 10th of November 1728 at a place called Pallas, or Pallasmore, in the parish of Forney, and county of Longford, in Ireland. He was the fifth among seven children of the Rev. Charles Goldsmith, who had married early in life when without means adequate for the support of a family, and who obtained

his first church preferment, the rectory of Kilkenny West, only in 1730, two years after the birth of Oliver. The future poet was accounted a dull child; and for this reason, as well as on account of the straitened circumstances of the father, it was at first intended to bring him up for a mercantile employment. He received the first rudiments of his education at a village school. Afterwards, when by a fondness for rhyming and other manifestations of wit he had so far excited hope that an uncle and other relations offered to undertake the expenses necessary for his being sent to the University of Dublin, he was removed to a school at Athlone, and thence, after an interval of two years, to another at Edgeworthstown. He entered at Trinity College, Dublin, as a sizar, in June 1745. His career here was anything but distinguished. He did not obtain a scholarship, and having been idle, extravagant, and occasionally insubordinate, he took his degree of B.A. two years after the regular time, in February 1749. A violent and injudicious tutor seems however to have been greatly responsible for the unsatisfactory nature of Goldsmith's college career.

Goldsmith's father was now dead; but his uncle, the Rev. Thomas Contarine, who had already borne the principal part of the expenses of his education, amply supplied the father's place. Yielding to his uncle's wishes, Goldsmith consented to enter the church; but he spent in dissipation the two years which should have been given to preparation, and on applying for orders was rejected by the bishop, for what reason is not exactly known, but probably it was on account of professional incompetence, joined to the report of his dissipated habits. He then obtained the situation of private tutor in the family of a neighbouring gentleman, and very shortly gave it up in disgust. His uncle Contarine now determined to prepare him for the profession of the law, and sent him off to London for the purpose of keeping his terms at the Temple; but stopping at Dublin on his way, he lost in gambling the sum wherewith he had been furnished for the expenses of his journey, and returned home penniless. The kindness of his uncle was not yet exhausted; and having forgiven him all his former offences, he sent him after a time to Edinburgh to study medicine. He arrived there towards the close of 1752; and having attended most of the medical professors, though without much assiduity, he proceeded at the end of two years to Leyden, for the professed purpose of completing his medical studies. He resided at Leyden about a year, studying chemistry under Gaubius and anatomy under Albinus, and at the same time indulging greatly in dissipation.

From Leyden Goldsmith set out to make a tour of Europe on foot, having with him, as is said, only one clean shirt and no money, and trusting to his wits for support. The following passage in the 'Vicar of Wakefield' is supposed to describe his own travels:—"I had some knowledge of music, and now turned what was once my amusement into a present means of subsistence. Whenever I approached a peasant's house towards nightfall, I played one of my most merry tunes, and that procured me not only a lodging, but subsistence for the next day." By means of this and other expedients he worked his way through Flanders (stopping at Louvain), parts of France and Germany, Switzerland (where he composed part of the 'Traveller'), and the north of Italy. He remained six months at Padua, and if (which is doubtful) he ever took a medical degree, he must have taken it there, or, as his first biographer suggested, at Louvain: unfortunately the official records are lost in both of these places, so that it is now impossible to ascertain the fact. Hearing while in Italy of the death of his uncle and benefactor, he immediately turned his steps towards England; and having expended about a year on his travels, landed at Dover in the autumn of 1756.

Arrived in London, he was for a time an usher in a school at Peckham, and being very speedily disgusted with this employment, next an apothecary's assistant. The liberality of an old schoolfellow, who accidentally discovered him, enabled him soon after to commence practice as a physician; and by the joint aid of medicine and literature (acting as reader in the printing-office of Richardson, the author of 'Clariassa Harlowe'), he managed for some short time to earn a scanty subsistence. In 1758 he obtained an appointment, which might have eventually turned out lucrative, as physician to one of the factories in India; and some of his letters written at this time show that he was very eager to proceed in that capacity to the East. In order to meet the expenses of his outfit and voyage, he immediately drew up and published proposals for printing by subscription his 'Inquiry into the Present State of Polite Literature in Europe.' From some unexplained cause however this appointment fell to the ground; and he did not pass an examination before the College of Surgeons, for which he offered himself, whether with a view to his eastern appointment, or to a subsequent scheme of obtaining a post as hospital mate, is not certain. He now fell back upon literature, and renewed an engagement with Mr. Griffiths, the proprietor and publisher of the 'Monthly Review,' to write for that journal, receiving in return a moderate salary besides board and lodging. The engagement was in the first instance to last for a year; but at the end of seven or eight months it was given up by mutual consent. He published his 'Present State of Literature in Europe' in 1759. In October of the same year he commenced writing the 'Bee,' a series of light essays which was intended to appear as a weekly periodical, but the issue of which ceased with the eighth number. These were followed by contributions to Smollett's 'British Magazine,' the delightful 'Chinese Letter' in the 'Public

Ledger, &c. In 1762 he began the 'Vicar of Wakefield,' for which Dr. Johnson, while Goldsmith was under arrest, succeeded in getting for him at once 60*l.*, but which was not published until 1766. 'The Traveller' appeared at the end of 1764, and in the same year his ballad of the 'Hermit.' In the meanwhile he had published his 'Life of Beau Nash,' 'Letters from a Nobleman to his Son,' and other hasty works and several compilations, and done much other book-sellers' work, for the purpose of immediate profit.

His comedy of the 'Good-Natured Man' was brought out at Covent-Garden in the beginning of 1768. It had been previously declined by Garrick, and did not meet with any very decided success, though Dr. Johnson pronounced it to be the best comedy which had appeared since 'The Provoked Husband.' In 1770 he published his 'Deserted Village;' and in the same year entered into engagements for writing his histories of Rome, Greece, and England. On the establishment of the Royal Academy of Painting, in 1770, Goldsmith was appointed professor of ancient history in the institution. In 1773 he appeared a second time as a dramatic author, and now with very great success. Dr. Johnson said of 'She Stoops to Conquer' that "he knew of no comedy for many years that has so much exhilarated an audience, that has answered so much the great end of comedy—making an audience merry." Its success was unequivocal, and it ran without intermission to the end of the season, and was resumed at the opening of the following one. One of his last publications was a 'History of the Earth and Animated Nature,' which appeared in 1774, and in which he had been engaged for two or three years. For this work he received the large sum of 850*l.*; but Goldsmith's money was ever given or gambled away as soon as it was received, and very shortly he was in as great embarrassment as before. In the spring of 1774 he was taken ill with a fever, which, aggravated by mental distress consequent on poverty, and also by a wrong treatment, which his physician could not dissuade him from pursuing, terminated fatally on the 4th of April. He died at the age of forty-five. He was interred in the burial ground of the Temple church, but no memorial was set up there to indicate the place of his burial, and it is now found to be impossible to identify the spot in which his remains were laid. His friends erected a monument to his memory in Westminster Abbey, for which a Latin inscription was written by Dr. Johnson; and in 1837 a marble slab, with an English inscription, was placed by the members of the Inner Temple, in the Temple church, to commemorate the fact of Goldsmith having died in the Temple and been buried within the Temple churchyard: this slab now stands in the vestry.

The preceding brief sketch of Goldsmith's life speaks plainly enough as to his character. He was weakness itself. Not without amiable dispositions, for indeed few men have possessed more benevolence or stronger family affections, he wanted the strength of purpose which can alone regulate them for good. At no period of his life did he resolutely pursue an object. Idle at the university, unwilling to settle down to any profession, and when he had made his choice, lazy and apathetic in its pursuit, he at last became an author, merely because authorship was necessary for subsistence, and wrote only as often and as much as the pressure of his wants required. He was ever ready to yield to the impulse of the moment, and a piteous tale would so work upon his feelings, that for the relief of an applicant he often not only gave his all, but even involved himself in debt. His weakness also assumed, in a remarkable degree, the form of vanity, with instances of which failing the reader of Boswell's 'Life of Johnson' will be acquainted.

Of Goldsmith the author but little need be said. The humour of the 'Vicar of Wakefield,' the pathos of the 'Traveller,' and the 'Deserted Village,' and the wit of some of his smaller poems, are known and appreciated by all. His numerous compilations, which were only written for money, are not proper objects of criticism. His histories of Greece and Rome certainly possess no critical value of any kind; and yet they have long been read with pleasure by a large class who feel the charm of the writer's easy and lucid style, without caring or troubling themselves about the accuracy of his statements.

A life of Goldsmith was published not long after his death by Bishop Percy; and a memoir of him is to be found in Sir Walter Scott's 'Miscellaneous Prose Works.' More recently three other lives of Goldsmith have appeared—by Prior, Forster, and Washington Irving: the largest is that by Mr. Prior; the best is that by Mr. Forster.

GOLIUS, JAMES, was born at the Hague, in 1596. He was educated at the university of Leyden, where he studied the ancient languages, mathematics, theology, and medicine, and made such great progress in his studies that he was appointed professor of Greek at Rochelle soon after he had attained his twenty-first year. He resigned this office after holding it a very short time, and returned to Leyden, where he devoted himself particularly to the study of Arabic under Erpenius. When the United Provinces sent an embassy to the king of Morocco, in 1622, Golius accompanied it by the advice of Erpenius, in order to obtain a more accurate knowledge of the Arabic language. He had already made sufficient proficiency in Arabic to present to the king of Morocco a memorial written in that language. In 1624 Golius was appointed professor of Arabic on the death of Erpenius, who had recommended him as the only person worthy to fill the chair. In the following year he sailed to the Levant, travelled in Arabia and Mesopotamia, and returned home by way of Constantinople in 1629.

During his absence he was appointed professor of mathematics. He resided at Leyden for the remainder of his life, and died on the 23th of September, 1667. The work which has given most celebrity to the name of Golius is his 'Lexicon Arabico-Latinum,' published at Leyden, 1653, in folio. It was principally formed on the basis of the Arabic Lexicon of Jauhari, entitled 'Al Sihah,' that is, 'the purity,' and has been deservedly considered as a most extraordinary work for the time in which he lived. Many Arabic scholars prefer it to the new Lexicon by Professor Freytag of Bonn. Among the other principal works of Golius we may name 'Proverbia quaedam Alis Imperatoris et Carmen Togral,' Leyden, 1629, 8vo; 'Ahmedis Arabiadæ Vitæ et Rerum gestarum Timuri,' Leyden, 4to, 1636; and a reprint of the Arabic grammar of Erpenius, Leyden, 1656, with the addition of several Arabic works. He also compiled a Persian Lexicon, in his 'Lexicon Heptaglotton.' Further particulars concerning the works of Golius are given by Schnurrer in his 'Bibliotheca Arabica,' and by Silvestre de Sacy in the 'Biographie Universelle,' art. Golius.

GOLTZIUS, HENRY, a celebrated engraver and painter, was born at Mulbrecht, in the duchy of Juliers, in 1558. He was first instructed by his father, who painted on glass, and afterwards studied design under Jacques Leonhard; but it was his own genius and application that raised him to the rank which he held among the best artists of his time. He began as an engraver; and some of his earliest prints bear the date of 1578. One of them is a portrait of his father John Goltzius. Bartsch says he did not begin to paint till he was 42 years of age.

He first settled at Haarlem, where he married, and where he resided for a considerable time. He then travelled through several parts of Italy, and studied a long while at Rome, where he assumed the name of Henry Bracht to avoid interruption, till he thought himself capable of appearing to advantage as a painter. He was indefatigable in his attention to nature as well as the antique; and he made many designs after Raffaello and Michel Angelo. Late as he began it was incredible what a number of pictures he finished. Two of his best were his 'Danaë' and a picture of the 'Crucifixion.' History and portraits were his favourite subjects in both arts.

Goltzius's finest engraving, 'the Boy and Dog,' bears the date of 1597. His two prints of the 'Hercules in the paisee of the Belvedere' were published immediately after his death, which happened January 1, 1617. Goltzius was the founder of a school which had a fine and singular command of the graver. His immediate and most successful pupils were Mathan, Saenredam, and Müller.

GOMAR, FRANCIS, was born at Bruges, on the 30th of January 1563. After spending some time at the universities of Strasbourg and Heidelberg, he came to England in 1582, and continued his studies at Oxford and Cambridge, at the latter of which he took the degree of Bachelor of Divinity in 1584. In 1587 he was chosen pastor of the Flemish church at Frankfurt, and in 1594 professor of divinity at Leyden. He is principally known as the opponent of Arminius, who was appointed as his colleague at Leyden in 1603. On the death of Arminius in 1609, and the appointment of Vorstius, who held similar theological doctrines, as his successor, Gomar retired to Middelburg, where he remained till 1614, when he was elected professor of divinity at Saumur. Four years afterwards he settled at Groningen as professor of Hebrew and divinity, at which place he remained till his death in 1641. He was present at the synod of Dort in 1618. His works were printed at Amsterdam in 1645. As he took the lead in opposition to Arminius, those persons who agreed with him in condemning the opinions of Arminius were called Gomarists, and also Anti-Remonstrants. They obtained the latter name from their opposition to the remonstrance which Arminius presented to the States-General in 1608. An account of the theological warfare between Gomar and Arminius is given under ARMINIUS.

GONDI. [RETZ, CARDINAL DE.]

GONGORA (LUIS GONGORA Y ARGOTE), was born at Cordova in 1561. He was sent at the age of fifteen to Salamanca, to study the law, which the love of poetry soon induced him to abandon. He wrote during his stay at that university the greater part of his jocosse, amatory, and satirical pieces, which in language and versification are the best of his compositions. He had frequently to struggle with poverty, which evidently embittered his sarcastic muse. At last, in his forty-fifth year, he took holy orders, and obtained a scanty prebend in the cathedral of Cordova. He tried however to improve his prospects by going to Madrid, where, after eleven years of wearisome expectation, he was made one of the chaplains of Philip III., in whose court he found his talents fully appreciated. A sudden illness subsequently deprived him of his memory, and he returned to his native city, where he died on the 24th of May, 1627.

The disciples of the classic Spanish school were already tainted with the extravagant notions of the Italian Marinists, when Gongora unfortunately came with his vigorous mind, and as it were at the critical hour, to bring them into full fashion. He tortured the Spanish language without mercy, called his new phraseology *estilo culto*, and answered with intemperate abuse the judicious censure of his eminent contemporaries, the two brothers Argensolas, Lope de Vega, and Quevedo. On the other hand, the declining state and consequent wavering taste of his countrymen gave him what he desired, a crowd of admirers and imitators, who, with less talent, carried to excess the empty pomp and verbose obscurity of the artificial language and

uncommon turn of thought of their dazzling model. They even split into two distinct although congenial schools: that of the 'cultoristas,' the more zealous adherents of the pedantry of their master; and that of the 'conceptistas,' the rivals of the Italian 'concettisti,' who formed a set of still more conceited revellers in the wild regions of fancy. There are various compositions of Gongora still unpublished, but a *Romancero* under the title of 'Delicias del Parnaso' contains all his 'romances' and 'letrillas.'

The cultorista Alonso Castillo Solórzano extended Gongorism even to America, where he published his own works in Mexico in 1625. The earliest German romances were imitations of Gongora by Gleim.

GONZA'GA, a historical family of Italy, which was numbered among the sovereigns of that country as hereditary dukes of Mantua and Monferrato for more than three centuries. The Gonzaga, like the Medici, did not belong to the feudal nobility; they were originally a plebeian family, which took its name from their native village. Luigi Gonzaga was appointed Podestà of Modena in 1313, through the influence of Passerino Bonaccolai, lord of Mantua. In 1328, a conspiracy having broken out at Mantua against Bonaccolai, who was murdered with all his relatives, Luigi Gonzaga, who was privy to the conspiracy under the pretence of restoring liberty to his country, was appointed captain-general, and in the following year the Emperor Louis of Bavaria made him imperial vicar of Mantua. From that time the Gonzagas became hereditary rulers of that country. A century later they assumed the title of marquises of Mantua, still acknowledging themselves feudatories of the empire. They were repeatedly engaged in war with the visconti of Milan. In 1495 Gianfrancesco Gonzaga placed himself at the head of the Italian league, for the purpose of driving the French under Charles VIII. out of Italy. He commanded at the battle of Tornovo on the river Taro, on the 6th of July of that year, in which the French were worsted, and Charles was obliged to make a precipitate retreat across the Alps. Gonzaga then marched towards Naples, was present at the battle of Atella, and contributed with Gonzalo of Cordova to the evacuation of the kingdom by the French, and the restoration of the Aragonese dynasty. When Louis XII. again invaded Lombardy, Gonzaga was obliged, in order to save himself, to do homage to him, and in 1509 he joined the league of Cambrai against the Venetians. His son Frederic fought against the French commanded by Lautrec and Bonniwet, and as a reward for his services was made Duke of Mantua by Charles V., and obtained also the marquise of Monferrato in 1586. Frederic's brother, Ferrante Gonzaga, distinguished himself also in the imperial service, and was made by Charles V. governor of the Milanese. He founded the line of the dukes of Guastalla, a principality which he obtained partly by purchase and partly by intrigue. Guglielmo, son and successor of Frederic, was humpbacked, and it is recorded that when he ascended the ducal throne the courtiers vied with each other in putting on artificial humps, thinking to please their sovereign thereby. He proved a good prince, and he protected the learned; Bernardo Tasso, the father of Torquato, was his secretary; Paolo Sarpi was for a time his theologian, and the Jesuit Possevin his confessor. The city of Mantua in his time had a population of 43,000 inhabitants, almost double its present number. His son Vincenzo early showed a disposition for learning, and a fondness for learned men. He went to Ferrara on purpose to effect the deliverance of Torquato Tasso, who was confined as being insane, and he obtained his liberty from the Duke Alfonso d'Este. But in the course of time, after he succeeded his father on the ducal throne, Vincenzo abandoned himself entirely to pleasure, neglected the interests of his subjects, and dilapidated the property of his own family. It was he who has been charged with the assassination of James Crichton, in 1583, who had been his preceptor. [CRICHTON.] Vincenzo died in 1612, and was succeeded by his son Francis, who began by introducing economy into the palace, from which he drove away the actors, singers, and parasites whom his father had gathered round him. He died a few months after his accession, and was succeeded by his brother, Cardinal Ferdinando Gonzaga, who, dying in 1626, left his states to his other brother, Vincenzo, who died in the following year. None of these three princes left any legitimate son, and with the last, Vincenzo, the direct line of the house of Gonzaga became extinct in 1627. It was however succeeded in the sovereignty by the lateral branch of Nevers, descended from Louis, brother of Guglielmo the humpbacked, who, having gone to France, had married there Henrietta of Cleves, heiress of the duchies of Nevers and Rethel. His son Charles was called to Italy by the prospect of the extinction of the ducal house of Mantua, and after the death of his cousin, the Duke Vincenzo, he claimed the succession to the ducal throne. But his claims were disputed by his cousin Gonzaga, duke of Guastalla, a descendant of Don Ferrante, already mentioned; and the Duke of Savoy, seizing the pretext of the disputed succession, invaded Monferrato, upon which he had some old claims, while the emperor Ferdinand II. on his side invaded Mantua as an imperial fief. Louis XIII. took the part of the Duke of Nevers, and the question of the Mantua succession occasioned a European war. The French entered Piedmont, and obliged the Duke of Savoy to raise the siege of Casale in Monferrato in 1629, while the imperial army took Mantua after an obstinate siege, and pillaged the town for three days. The paintings, statues, and other works of art, collected during centuries

by the dukes Gonzaga, were carried to Prague, many of them were purchased by Christina of Sweden, and afterwards bought by the Duke of Orleans for his gallery of the Palais Royal. At last, in 1630, by the treaty of Ratisbon, between the emperor and France, and that of Cherasco, with the Duke of Savoy, Charles of Nevers was put in possession of Mantua and Monferrato, and received the solemn investiture from the emperor. In 1635 he seized upon the principality of Correggio, which he added to his dominions. He died in 1637, and was succeeded by his grandson Charles, under the regency of his mother. Charles proved a weak dissipated prince; he wavered between the French and Spanish alliances during the Italian wars; he sold, in 1659, the duchies of Nevers and Rethel and his other possessions in France to Cardinal Mazarin, and died in 1605, leaving an only son, Ferdinand Charles, under the guardianship of his mother, who was an Austrian archduchess. Ferdinand, once on the throne, showed himself even more dissolute than his father. He collected at his court female performers, singers, and dancers from every part of Italy, in whose company he delighted, and by whom he was attended when he travelled about. On the breaking out of the war of the Spanish succession, Ferdinand, although a feudatory of the emperor, allowed the French to garrison Mantua. The emperor Joseph I. put him under the ban of the empire as a traitor; and as the French ultimately lost their footing in Italy, the Austrians took possession of Mantua, which was annexed to the Milanese. Ferdinand being deserted by the French, for whose sake he had lost his dominions, retired to Padua, where he died in 1708, leaving no issue. He was the last duke of Mantua. The other lateral branches of the Gonzagas, of Guastalla, Sabbioneta, Novellara, and Castiglione, became also extinct, or were dispossessed of their principalities. Some of their descendants were living at Mantua not many years since as private individuals. The 18th century saw the extinction of three Italian sovereign houses, Medici, Gonzaga, and Farnese, while that of Este has been perpetuated only by a female.

GONZA'LO, HERNANDEZ DE CORDOVA, surnamed the Great Captain, was born of noble and wealthy parents at Montilla, near that city, in 1453. Having early lost his father, he was brought up by a knight called Diego Cárcamo, who inspired him with that grandeur of soul and love of glory by which Gonzalo amply compensated the disadvantages to which the law of primogeniture had subjected him as a second son. When the city of Cordova espoused the cause of the Infante Don Alonso against his brother Henry IV., Gonzalo, though yet an inexperienced youth, was sent by his brother Alonso de Aguilar to Avila, where the unfortunate Henry was solemnly despoiled of crown and sceptre. On the sudden death of the new king, his sister Isabella, the right heiress to the Castilian crown, also requested the service of Gonzalo against the partisans of Juana, called La Bertraneja, the dubious daughter of the dethroned Henry, who was married to the King of Portugal.

Gonzalo, by his military and fashionable accomplishments, heightened by his character for generosity, was hailed as the prince of the Spanish youth, and became the greatest ornament of Isabella's court. His intrepidity at the head of 120 horse belonging to his brother, which aided in the defeat of the Portuguese at Albuera, excited general admiration. In the protracted contest of ten years, which resulted in the final conquest of Granada, he took part in all the important engagements, and also carried on a sort of constant guerilla warfare, which struck the Moors with terror and amazement.

When Charles VIII. of France, instigated by Ludovico Sforza of Milan, conquered Naples in 1495, Gonzalo was sent by Ferdinand the Catholic to expel the invaders, and restore the crown to the native king. Europe was soon astonished by the brilliancy and rapidity of his success. His only difficulty was to garrison the numerous places which he reduced in quick succession. Both friends and foes proclaimed him the Great Captain, a title which has always been attached to his person and memory.

After the expulsion of the French from Naples, Pope Alexander VI. called in the aid of Gonzalo against one Menoldo Guerri of Biscey, to whom Charles VIII., on his retreat, delivered Ostia in trust, and who, by his exactions from the trading-vessels of the Tiber, distressed and starved Rome. Gonzalo surrounded that fortress with his veterans, stormed it on the eighth day, and the capital of Christendom beheld the hero of the age bringing in chains the monster who had kept her so long in alarm—a modern triumph, the glory of which the conqueror enhanced by requesting and obtaining the pardon of the vanquished, and an exemption from all taxes, during ten years, for the inhabitants of Ostia and its environs. He took leave of the pontiff by pointing out the necessity of a reform in his household and court. Thus did the Great Captain crown his first expedition to Italy in 1498. Two years after he suppressed a revolt of the converted Moors in the Alpujarras, and requested their pardon also as the reward of his victory.

Louis XII., inheriting the throne and the ambition of his cousin Charles VIII., made preparations to expel Sforza from Milan, and to stretch his arm as far as Naples. Ferdinand, who now agreed to partake of the spoils, sent Gonzalo to Italy again, but only as an ally of the Venetians. The first result of this campaign was the taking of Cephalonia from the Turks, after a siege of fifty days, at the end of 1500. On the first news of the deposition of the king of Naples

being sanctioned by the pope, Gonzalo gave up the estates with which that king had rewarded his previous services. Subsequently however he stained his character by an act of which he repented in his old age; he sent the hereditary prince, the Duke of Calabria, as a prisoner to Spain, notwithstanding he had solemnly bound himself to respect his liberty, under the plea of Ferdinand's disapproval of that pledge, which wanted his previous royal consent. The partition of Naples between the Spanish and French soon brought them into collision, and afforded Gonzalo a second and more brilliant opportunity of defeating and finally driving away the French, and of reconciling the natives to the Spanish sway. Ferdinand at last grew jealous of a subject whose brilliant success threw the kingly dignity into the shade. Even in the decline of his authority and power, after Isabella's death, and when Gonzalo, in a letter dated Naples, 2nd of July 1506, reassured him of his unconditional and most firm adherence, and when the pope and the Venetians strove to place the Great Captain at the head of their respective forces, the distrustful king did not cease to make common cause with the envious courtiers, and succeeded in removing his most faithful subject from Italy.

Returning to his country in 1507, and passing through Savona, where Ferdinand and Louis XII. had an interview, he received the highest attentions from the French king and his suite. More flattering still and bordering almost on adoration was his reception in every part of Spain, except at court, where he met only with contumely. He was even refused the mastership of Santiago, which had been so often and so solemnly promised him; nor could he obtain leave to join Cardinal Cisneros in his expedition to Africa. Nevertheless, in the hour of need, when the new viceroy of Naples, Don Ramon de Cardona, was defeated at Ravenna by Gaston de Foix, on Easter-day, April 11th, 1512, Ferdinand requested Gonzalo to organise a fresh expedition to Italy. But when he was ready to depart with his veterans and the volunteers who had flocked to his standard, Ferdinand's fears subsided, and distrust reassuming its wonted sway over his mind, he ordered the disbanding of the forces. As the army was composed of numerous volunteers who had parted with all their property, in order to furnish themselves for the expedition, their intended leader, grieved at the sacrifices which they had made, and keenly feeling their disappointment, convened them at Antequera, and rewarded them in a princely style. Such was the best way of enjoying his wealth, he said, when remonstrated with for the extravagance of his munificence. At the same time he wrote to the king a letter replete with bitterness and complaint. At length an accumulation of mental suffering impaired his health, and terminated his existence on the 2nd of December 1515. Two hundred tattered banners and two royal pennons, once unfurled by the enemy, waved over the tomb of the hero who raised the Spanish soldiery to that superiority which they maintained in Europe for more than a century.

GOOD, JOHN MASON, M.D., was born on the 25th of May 1764, at Epping, where his father was minister of an Independent congregation. He was educated at home, where he studied Latin, Greek, and French. At fifteen years old he was apprenticed to a surgeon in Gosport, on leaving whom he studied for a short time at Guy's Hospital, and, in 1784, commenced practice in partnership with a surgeon at Sudbury. He met however with but slight success; and in consequence of having engaged himself as security for a friend who failed, he was induced to remove to London in 1793, principally with a view of obtaining employment in literature. For a time his progress was very slow; but by perseverance he succeeded, and in 1820 found himself so well established, both in literary and professional fame, that he determined on taking the diploma of M.D. at Marischal College, Aberdeen. From this time to his death, which occurred in January 1827, after a long and painful illness, he continued actively pursuing the practice of medicine and the study of almost all branches of science and literature.

Dr. Good was a voluminous writer on various subjects, but none of his works have any permanent value; his principal works were the following:—

1795. 'Dissertation on Diseases of Prisons and Poorhouses,' prize essay, published at the request of the London Medical Society, 12mo. 1795. 'A short History of Medicine,' published at the request of the Pharmaceutical Society, 12mo. It consists principally of a history of the practice of apothecaries in England. 1800. 'Translation, in verse, of the Song of Solomon.' 1803. 'Memoirs of Dr. Geddes,' 1 vol. 8vo. 1805. 'Translation of Lucretius' (in verse), 2 vols. 4to., his principal classical work. 1812. 'Translation of the Book of Job,' 1 vol. 8vo. 1820. 'Physiological System of Nosology, with a corrected and simplified nomenclature,' 1 vol. 8vo. He had been twelve years collecting materials for this work, and it served as an introduction to the larger one which he published in 1822. 1821. 'Translation of the Book of Proverbs.' 1822. 'Study of Medicine,' in 4 vols. 8vo., consisting of a digest of the several systems of nosology previously published, and an attempt to classify all described diseases in regular orders, genera, &c., as in the arrangements employed in natural history. 1826. 'Book of Nature,' 3 vols. 8vo. This work contained the lectures delivered by the author at the Surrey Institution on the phenomena, 1st, of the material world; 2nd, of the animate world; 3rd, of the mind.

'A Translation of the Book of Psalms' was just completed at the time of his death. These however were but a portion of his works; for some time previous to settling in London he had been a large contributor to the 'World,' a daily newspaper, at that time in extensive circulation, and to the 'Analytical and Critical Review.' Of the latter he was for a considerable time the editor; and very many of the articles on theology, morals, and Eastern literature which attracted most notice in it, as well as in the British and Monthly Magazines, were from his pen. He was engaged at the same time in many other literary pursuits, as in the editing of the 'Pantologia,' in conjunction with Mr. Bosworth and Dr. O. Gregory,

The extent and variety of Dr. Good's works are sufficient to indicate their character; they evince great industry, with a retentive and orderly mind, and every mark of sincerity and piety; but they show that he was deficient in judgment, critical acumen, and personal observation; and his medical writings especially are hence of far less value than the labour that must have been bestowed upon them might have given them, had it been better directed. But he seemed to have no suspicion of his unfitness for any literary task; and hence never hesitated to undertake any project though most unsuited to his habits and acquirements. Thus, although wanting every requisite qualification for such a duty, his overweening self-confidence led him not only to consent to edit the Letters of Junius, but to select merely from his own opinion of resemblance of style, other letters which had been published under a great variety of names in Woodfall's Advertiser, and without scruple assign them to the great unknown, to the utter confusion, as it has proved, of almost all subsequent investigations respecting the author of the Junius Letters, and judgment of his character and conduct. Dr. Good's principal faculty seems to have been a facility of acquiring languages: he had learned Latin, Greek, and French, in his father's school; while an apprentice he acquired Italian, and soon after commenced Hebrew. While engaged in the translation of Lucretius he studied German, Spanish, and Portuguese; and afterwards, at different times, Arabic, Persian, Russian, Sanscrit, and Chinese. Of his knowledge of all these, evidence is presented in unpublished translations, in reviews of their literature, and in the constant references made to their works in his medical and other writings. A biography of Dr. Good was published by his friend Dr. Olinthus Gregory, in 1 vol. 8vo.

* GOODALL, the name of a father and son who have attained great distinction among living English artists.

* EDWARD GOODALL, the father, is best known by his vignette engravings after Turner. Born at Leeds in September 1795, he at an early age commenced the study of art, and practised drawing, painting, and engraving, but eventually adopted the last as his profession. It is said that he never studied as a regular pupil under any engraver; and it is certain that he adopted a decidedly original manner. He has engraved a very large number of book illustrations, chiefly landscapes, and it is in small landscapes, and especially the landscapes of Turner, that his great strength lies. Nothing probably can surpass the exquisite tact with which Mr. Goodall has, in his vignettes, rendered the peculiarities of Turner's manner. The vagueness of detail, and the accuracy of general drawing, the extraordinary knowledge of natural phenomena, the elaborately beautiful skies, the misty mountains, the ever-varying water, and the often marvellous general effect—all are given with the most thorough truth and refinement in the unrivalled little vignettes which adorn the 'Italy,' and the 'Poems' of Rogers. Mr. Goodall has also engraved very admirably several larger plates, after the same great master, in Turner's 'South Coast,' and other works; and, of the full plate size, Turner's 'Cologne,' 'Tivoli,' and 'Caligula's Bridge;' but it is in his vignettes that the great beauty and delicacy of Goodall's burin are most conspicuous.

* FREDERIC GOODALL, the son, is a painter of history and genre. He was born in London in September 1822. His studies in art have been exclusively directed by his father; and so early had young Goodall acquired mastery over his pencil, that when only fourteen he received commissions to make drawings of Lambeth Palace, and Willesden church, and was employed by B. Hawes, Esq., M.P., to make a series of drawings of the Thames Tunnel in its working state. His studies in the tunnel furnished him with materials for his first oil picture, 'Finding the Dead Body of a Miner by Torchlight,' which he commenced at the age of fifteen, and for which the Society of Arts awarded him the large silver medal. During the summers of 1838-42, he made sketching excursions in Normandy and Brittany, and his studies there supplied him with subjects of numerous pictures, representing chiefly the peasant life of those countries. The first of these, 'French Soldiers Playing at Cards in a Cabaret,' appeared (as his first painting there) in the exhibition of the Royal Academy in 1839. Others of the series were—'Entering and Leaving Church;' 'The Christening;' 'Veteran of the Old Guard Describing his Battles;' 'The Fair of Fougères;' 'Tired Soldier;' 'Rustic Music;' 'La Fête du Mariage;' 'The Wounded Soldier Returned to his Family;' 'The Conscript;' 'Going to Vespers.' In 1844 Mr. Goodall was led to vary his style by a visit to Ireland, among the results of which were his 'Fairy-Struck Child;' 'Irish Courtship;' 'Irish Piper;' and 'The Departure of the Emigrant Ship;' on the whole, perhaps these Irish pictures are the most characteristic which he has painted. Four or five years later Mr. Goodall commenced painting English subjects, and to these his

practice has been since chiefly confined. One of the first and best of his English pictures was the 'Village Festival,' exhibited in 1847, and purchased by Mr. Vernon, for presentation, with the rest of his fine collection, to the nation. Mr. Goodall's subsequent pictures have been—'Hunt the Slipper' (1849); 'Woodman's Home' (1850); 'Raising the May Pole' (1851); 'The Last Load' (1852); 'An Episode of the Happier Days of Charles I.' (1853); 'The Swing' (1854); 'The Arrest of a Peasant Royalist—Brittany, 1793' (1855); and 'Cranmer at the Traitors' Gate' (1856).

Mr. Goodall's success was recognised by his election as an associate of the Royal Academy in 1852, despite the growing disinclination of that always sufficiently exclusive body to admit within its ranks any painters who have not been trained in its schools. Mr. Goodall's style is pleasing and refined, and he is as careful as well as an able painter; but his progress has scarcely, it must be confessed, been as great as his early proficiency promised. His later pictures suggest the need of a somewhat more vigorous and masculine style, and a more self-reliant and independent tone of thought.

GORDIANUS, MARCUS ANTONIUS AFRICANUS, born under the reign of the first Antoninus, of one of the most illustrious and wealthy families of Rome, made himself very popular during his quaestorship by his munificence and the great sums which he spent in providing games and other amusements for the people. He also cultivated literature, and wrote several poems, among others one in which he celebrated the virtues of the two Antonines. Being entrusted with the government of several provinces, he conducted himself so as to gain general approbation. He was proconsul of Africa in 237, when an insurrection broke out in that province against Maximinus, on account of his exactions, and the insurgents saluted Gordianus as emperor. He prayed earnestly to be excused on account of his great age, being then past eighty, and to be allowed to die in peace; but the insurgents threatening to kill him if he refused, he accepted the perilous dignity, naming his son Gordianus as his colleague, and both made their solemn entry into Carthage in the midst of universal applause. The senate cheerfully confirmed the election, proclaiming the two Gordiani as emperors, and declaring Maximinus and his son

Coin of Gordianus the Elder.

The inscription on the obverse of the two medals is the same.

to be enemies to the country. Meantime however Capillianus, governor of Mauritania, collected troops in favour of Maximinus, and marched against Carthage. The younger Gordianus came out to oppose him, but was defeated and killed, and his aged father, on learning the sad tidings, strangled himself. Their reign had not lasted two months altogether, yet they were greatly regretted, because of their personal qualities, and the hopes which the people had founded on them. The younger Gordianus was forty-six years of age, was well informed, and had written several works. He is charged with being too much addicted to women. The senate, on hearing the news of their death, elected Balbinus and Maximus in their place to oppose the ferocious Maximinus. [BALBINUS.]

GORDIANUS, MARCUS ANTONIUS PIUS, grandson by his mother of the elder Gordianus, and nephew of Gordianus the younger, was twelve years of age when he was proclaimed Cæsar by general acclamation of the people of Rome, after news had arrived of the death of the two Gordiani in Africa. The senate named him colleague of the two new emperors, Maximus and Balbinus; but in the following year (A.D. 238, according to Blair and other chronologists) a mutiny of the prætorian soldiers took place at Rome, Balbinus and Maximus were murdered, and the boy Gordianus was proclaimed emperor. His disposition was kind and amiable, but at the beginning of his

reign he trusted to the insinuations of a certain Maurus, and other freedmen of the palace, who abused his confidence, and committed many acts of injustice. In the second year of his reign a revolt broke out in Africa, where a certain Sabinianus was proclaimed emperor, but the insurrection was soon put down by the governor of Mauritania. In the following year Gordianus, being consul with Claudius Pompeianus, married Furia Sabina Tranquillina, daughter of Mithreus, a man of the greatest personal merit, who was then placed at the head of the emperor's guards. Mithreus disclosed to Gordianus the disgraceful conduct of Maurus and his friends, who were immediately deprived of their offices and driven away from court. From that moment Gordianus placed implicit trust in his father-in-law, on whom the senate conferred the title of Guardian of the Republic. In the next year news came to Rome that the Persians under Sapor had invaded Mesopotamia, had occupied Nisibis and Carthæ, entered Syria, and, according to Capitolinus, had taken Antioch. Gordianus, resolving to march in person against this formidable enemy, opened the temple of Janus, according to an ancient custom which had been long disused, and, setting out from Rome at the head of a choice army, took his way by Illyricum and Mœsia, where he defeated the Goths and Sarmatians, and drove them beyond the Danube. In the plains of Thrace however he encountered another tribe, the Alani, from whom he experienced a check, but they having also retired towards the north, Gordianus crossed the Hellespont and landed in Asia, whence he proceeded to Syria, delivered Antioch, defeated the Persians in several battles, retook Nisibis and Carthæ, and drove Sapor back into his own dominions. The senate voted him a triumph, and also a statue to Mithreus, to whose advice much of the success of the

Coin of Gordianus Pius.

emperor was attributed. Unfortunately however that wise counsellor died in the following year, under the consulship of Arrianus and Pappus, not without suspicions of foul play being raised against Philippus, an officer of the guards, who succeeded him in the command. In the year after, A.D. 244, Gordianus advanced into the Persian territory, and defeated Sapor on the banks of the Chaboras; but while he was preparing to follow him, the traitor Philippus, who had contrived to spread discontent among the soldiers by attributing their privations to the inexperience of a boyish emperor, was proclaimed by the army his colleague in the empire. Gordianus consented; but soon after, Philippus, wishing to reign alone, caused him to be murdered. A monument was raised to him by the soldiers, with an inscription, at a place called Zaitha, twenty miles east of the town of Ciresium, not far from the left bank of the Euphrates, which continued to be seen until it was destroyed by Licinius, who assumed to be a descendant of Philippus. Gordianus was about twenty years old when he died; his body, according to Eutropius, was carried to Rome, and he was numbered among the gods. His short reign was a prosperous one for Rome.

GORDON, SIR JOHN WATSON, R.A., was born in Edinburgh towards the close of the last century, and received his professional education in the Trustees Academy, of which Mr. John Graham was then master. After coying for awhile with history and poetry, Gordon devoted himself exclusively to portrait-painting. The whole of his professional life has been spent in Edinburgh, where he may be said to have supplied the place of Raeburn in public estimation. During his tolerably long career, Gordon has painted almost all the leading lawyers, ministers, doctors, professors, and merchants of Edinburgh, and indeed almost every eminent Scotchman wherever resident. His portraits of his countrymen are something unique in their way, and as thoroughly characteristic as the heads of Titian's Venetian senators and merchants, or Rembrandt's burgomasters. Raeburn painted the poetic phase of the Scottish physiognomy to perfection; Gordon has with equal success painted its prosaic. His portraits are intensely realistic. The keen, shrewd, hard, Scottish face he depicts with a direct and homely verity, beyond the reach even of the daguerreotype; for, besides the literal rendering, he gives the mental characteristics, the lurking humour or stern decision of purpose, with unmistakable faithfulness. The technical merits of his portraits are answerable to their intellectual character. His drawing is always careful and always correct. His chiar-oscuro and colour are true and unaffected, and if not to be ranked with those of Titian, Rembrandt, and Vandyke, or even Reynolds and Raeburn, they surpass those of most other portrait-painters. Gordon paints with a firm touch, and good impasto; and whilst not neglecting details, always subordinates them—indeed every part of the picture—to the head. As we have said, he has painted most

of his eminent contemporary countrymen, and it would therefore be impossible to give here a list of their names. In truth we do not think that his more successful portraits are those of the more famous of his sitters: his likeness of Sir Walter Scott, for instance, is far from one of the best of the author of *Waverley*, and far from one of Gordon's best. His greatness lies in portraying the hard, canny, calculating, worldly-wise side of the Scottish character. An enumeration of one year's contribution to the Royal Academy Exhibition (that of 1851) will perhaps sufficiently convey an idea of the range of his commissions:—the Duke of Argyll; Sir W. Gibson Craig, M.P. for Edinburgh; Sir John Pakington, M.P.; Dr. Conolly; and Professor Wilson.

Gordon was one of the earliest of the members, if not one of the founders, of the Royal Scottish Academy, and he has always been one of its warmest friends. On the death of Sir William Allen in 1850, Gordon was elected its president. Her Majesty at the same time appointed him to the office of Painter-Linmer to the Queen in Scotland, and conferred upon him the honour of knighthood; and the Royal Academy, London, elected him an academician: he had been chosen an associate in 1841.

GORDON, ROBERT, was born in Aberdeenshire about the year 1580. He studied first at Aberdeen, and afterwards at Paris. On his father's death in 1600 he returned to Scotland, and succeeded to his ancestral estate of Straloch. At this time the vast collection of maps, and corresponding letter-press geographical and historical descriptions, projected by Blaeu of Amsterdam, was in progress. The Dutch editors had been put in possession of some geographical drafts of the various provinces of Scotland, drawn by Timothy Pont, an eminent geographer. These drafts, which are now preserved in the Advocates' Library, are singularly minute and curious, and very valuable as throwing light on the state of the country and the condition of property in Scotland at the time when they were executed. Pont had died in the execution of his task, leaving these drafts, minute and apparently accurate, but fragmentary and totally destitute of arrangement. The editors of the Atlas applied to King Charles, and solicited his patronage of the portion of the work applicable to Scotland, and his appointment of a person qualified to complete the work. It was placed by royal authority in Gordon's hands, in 1641. The part of Blaeu's Atlas, commonly called 'Theatrum Scotiae,' was finished by Gordon in 1648, and forms one of the eleven volumes of that work. It contains forty-nine minute and highly finished maps of the various provinces of Scotland, accompanied by a description in Latin, full of the results of extensive and accurate research. The result of the knowledge and labour bestowed on this work was to give a greater prominence to Scotland in this general geographical work than the position of the country entitled it to. Gordon's labours were considered as of so much national importance, that by a special act of parliament he was exempt from the quartering of soldiers and other public burdens, and, as he abstained from connecting himself with either side, he was respected in the midst of his labours by both the parties by which the country was then distracted. Gordon died in 1661. The geographical papers which he had originally prepared were still more extensive than the work published by Blaeu. There is a large mass of them among the manuscripts in the Advocates' Library, in the printed catalogues of which their titles will be found, and some portions of them have been lately printed by the book-clubs. Gordon had collected materials for a history of his own adventurous time. His son, James Gordon, clergyman of Rothiemay, who seems to have assisted him in his geographical labours, put these materials in a narrative form, and the 'History of Scots Affairs,' thus prepared, was printed in 1841, in three volumes, 4to, for the Spalding Club.

GORDON, THOMAS, was born at Kirkcudbright, in Galloway, about 1684, received his education at one of the Scotch universities, and came early to London, where he gained a livelihood by teaching languages, and by political authorship. It is said that he was employed by the Earl of Oxford. He is best known by his translation of Tacitus, 2 vols. fol., 1728-31, a scholar-like work, which has been referred to by Brotier as an authority in explaining doubtful passages. It is stiff and often ungraceful, from the author's desire to follow the order of words in the original as far as possible; but is on the whole the best translation of Tacitus in our language. Gordon also translated Sallust, with Cicero's four Orations against Catiline, 4to, 1744. Both works are accompanied by Political Essays.

Mr. Gordon in early life seems to have held democratic principles, which recommended him to the friendship of Mr. Trenchard, a gentleman of family and fortune, well known in the political world, whose widow ultimately became Gordon's wife. Conjointly they published a collection of papers, once of celebrity, called 'Cato's Letters,' also the 'Independent Whig.' It is said, however, that Gordon, after his friend's death in 1723, was gained over to the support of Walpole: and it is certain that he held the office of commissioner of the wine licences. He died in 1750. There are two collections of his tracts: 'A Cordial for Low Spirits,' 3 vols.; and 'The Pillars of Priestcraft and Orthodoxy shaken,' 2 vols., both posthumous.

GORDON, REV. WILLIAM, was born at Hitchin, Hertfordshire, in 1729. At an early age he became an Independent minister at Ipswich, and subsequently in London; but he had adopted republican views, and, from personal and political discontent, he emigrated in

1770 to America; and in 1772 was appointed minister of a church in Roxbury, Massachusetts. He attached himself warmly to the revolutionary cause, and became chaplain to the provincial congress of the colony. After the conclusion of peace he returned to England, where in 1788 he published his 'History of the Rise, Progress, and Establishment of the Independence of the United States of America.' It is cast into the form of a correspondence, in letters from America to Europe, and *vice versa*. The first letter contains a compendium of the history of the thirteen original States, from their establishment to the beginning of the war. The author professes to have applied himself from 1776 to the collection of materials; to have had access to the state records; and to have been favoured by Generals Washington, Gates, Greene, and others, with a liberal examination of their public and private papers. It will be obvious that a history written on the plan described is not likely to possess much value, except as a collection of contemporaneous evidence. It is written with a strong American bias. The author however did not return to end his days among the people he so much admired. He accepted an invitation to become minister of a congregation at St. Neots, Huntingdonshire; but differences of opinion soon sprung up, and he resigned his charge. He removed to Ipswich, where he died October 19, 1807; his last years having been passed in a state of hopeless imbecility.

* GÖRGEI, ARTHUR, was born on the 5th of February, 1818, at Toporz, an hereditary possession of his family, in the county of Zips, in Upper Hungary. He was sent in 1832 to the military school of Tulu, where he remained till 1837, when his father's influence procured him admission into the royal Hungarian Life-Guards, stationed at Vienna. In 1842 he was attached to the Hussars of the Palatinat, with the rank of lieutenant. His father died in 1843, and in 1845 Görgei quitted the army, and removed to Prague in order to study the sciences in the university of that city. He appears to have attached himself especially to chemistry, which he studied under Redtenbach. He had spent the early part of the year 1848 on the estate of a relative in northern Hungary, living a quiet country life, when the Hungarian Committee of Defence, with Kossuth as its president, in the month of March called for volunteers to defend the country against the armies of the Croats and Slavonians under their Ban, Jellachich. Görgei obeyed the call, and was immediately invested with the rank of Captain, and attached to the fifth battalion of the Honveds, then in process of formation at Raab. He soon afterwards left this battalion on receiving a commission to purchase muskets and superintend the preparation of other fire-arms. He was next ordered to assist at Pesth in the formation of a plan for the concentration of the Mobile National Guard from the four circles of Hungary, and was himself appointed to the command of the circle of This-Side-the-Theiss, with the rank of Honved Major. His chief station was at Szolnok, and after collecting about 700 men of the 5000 calculated upon, he was ordered in the month of September to occupy the island of Csepel in the Danube below Pesth, in order to oppose any attempt of Jellachich or his auxiliaries under Roth and Philippovich to cross the Danube. Before proceeding there he obtained from the Hungarian prime-minister, Count Louis Batthyany, a document authorising him to form, when requisite, a court-martial to adjudicate upon cases of treason, disobedience, and cowardice, to confirm condemnations to death, and to order their execution. While at Csepel collecting and organising troops, he received, on the 30th of September, information that Counts Eugene and Paul Zichy had been arrested at the outposts on suspicion of treason, and were detained at his head-quarters at Adony. He went there, and conducted the prisoners to the island of Csepel, where he summoned a court-martial, and sat himself as president. Count Eugene Zichy was found guilty of being in communication with Jellachich; Görgei passed sentence of death upon him, and the sentence was forthwith carried into execution. Count Paul Zichy, against whom there were no proofs suitable for the proceedings of a court-martial, was transferred to the ordinary courts of law.

Görgei was soon afterwards incorporated with his detachment into the corps of Colonel Perczel, who had the command of an expedition sent against General Roth. The command of the vanguard was assigned to Görgei, whose strategic movements caused Roth's corps, on the 7th of October, to lay down their arms, and on the 8th Görgei was promoted to the rank of Honved Colonel. He was next attached to the army of General Moga, commander-in-chief of the Hungarian forces. On the 29th of October they crossed the Fischa, for the purpose of relieving the city of Vienna, then besieged by the army under Prince Windischgrätz. A battle was fought near Schwechat, and the Hungarians were signally defeated, the national guards having run away in the utmost confusion. General Moga was injured by a fall from his horse, and Kossuth, on the 1st of November, advanced Görgei to the rank of General, and invested him with the command-in-chief of the Hungarian armies. In the month of December the Austrian army, under Windischgrätz, crossed the frontiers of Hungary, and Görgei was compelled to abandon Presburg, and retreat from Raab; he was repulsed at Windschacht, and only saved his army by a retreat over the Sturecz mountain. In February 1849 he was superseded in the command-in-chief by General Dembinski, a Pole, whom the superior Hungarian officers refused to serve under, and, calling a council, made their determination known. Dembinski was then superseded by General Vetter, who, having fallen ill, the command in

chief was again conferred on General Görgei. The Austrians afterwards suffered a series of defeats. Görgei's advanced guard under Damjanics stormed Waitzen, while he himself won the battle of Nagy-Sarló, and relieved the garrison of Komorn. On the 14th of April Hungary was declared an independent state, a measure to which Görgei was decidedly opposed. A provisional government was formed, Kossuth was named Governor of Hungary, and Görgei was appointed minister of war, the duties of which office were executed by deputy, first by Damjanics and afterwards by Klapka. Meantime Görgei publicly announced his opposition to the provisional government, and thwarted many of their measures. He however at their request besieged Buda, and took it by storm on the 21st of May, after which the seat of the provisional government was transferred from Debreczin to Pesth. A series of disasters soon afterwards attended the Hungarians. At the request of the Austrian government, a Russian army, under Prince Paskiewitch, began to cross the Carpathian Mountains and enter Hungary, while the Austrian armies, now under the command-in-chief of Field-Marshal Haynau, advanced towards Buda and Komorn. The Hungarian troops were defeated before Komorn, and Görgei was wounded, but the main body made good its retreat to Waitzen, where Görgei, after a few days, when the state of his wound permitted, joined the troops, while Klapka remained with the garrison in the fortress of Komorn. Görgei's retreat with his army, closely pursued by the Russians, through the Carpathian Mountains, and then southwards by Debreczin and Gros-Wardein to Arad, occupying from the 22nd of July to the 9th of August, is considered by military authorities to have been a masterly series of strategic operations. The Hungarian army in the south had been beaten by Haynau, and retreated till its shattered remains united with the troops under Görgei before Arad. On the 11th of August Kossuth, by proclamation, resigned his governorship, and created Görgei dictator. On the 17th of August, 1849, the Hungarian army, 24,000 strong, and with 150 guns, laid down their arms at Vilagos to the Russian general Rudiger. Görgei also sent orders to General Klapka to surrender the fortress of Komorn. This however Klapka refused to do, and afterwards obtained honourable terms of capitulation. On the 29th of August Görgei received a letter from Haynau communicating the pardon of the Emperor of Austria, and appointing Carinthia as his place of residence. He has since resided at Klagenfurt, and has published 'Mein Leben und Wirken in Ungarn in den Jahren 1848 und 1849, von Arthur Görgei,' 8vo., Leipzig, 1852, which was soon afterwards translated into English under the title of 'My Life and Acts in Hungary in the years 1848 and 1849,' 2 vols. 8vo, London, 1852.

GORGIAS, of Leontini, in Sicily, celebrated among contemporaries as a statesman, sophist, and orator, belongs to the most brilliant period of the literary activity of Greece, and has been immortalised by the Dialogue of Plato which bears his name. The dates of his birth and death are alike uncertain, but he is said to have been older than Antiphon, the orator, who was born in 380 B.C., and the number of his years far outran the ordinary length of human existence, in the different statements ranging between 100 and 109. Whatever may have been the speculative errors of Gorgias, his long life was remarkable for an unswerving practice of virtue and temperance, which secured to his last days the full possession of his faculties, and imparted cheerfulness and resignation to the hour of death.

According to Eusebius, Gorgias flourished in the 86th Olympiad, and went to Athens (Olymp. 88, 2, or B.C. 427) to seek assistance for his native city, whose independence was menaced by its powerful neighbour Syracuse. In this mission he justified the opinion which his townsmen had formed of his talents for business and political sagacity, and upon its successful termination withdrew from public life and returned to Athens, which, as the centre of the mental activity of Greece, offered a grand field for the display of his intellectual powers and acquirements. He did not however take up his residence permanently in that city, but divided his time between it and Larissa in Thessaly, where he is said to have died shortly before or after the death of Socrates.

To the 84th Olymp. is assigned the publication of his philosophical work entitled 'Of the Non-being, or of Nature,' in which, according to the extracts from it in the pseudo-Aristotelian work 'De Xenophane, Zenone, et Gorgia,' and in Sextus Empiricus, he proposes to show, 1st, that absolutely nothing subsists; 2nd, that even if anything subsists, it cannot be known; and 3rd, that even if aught subsists and can be known, it cannot be expressed and communicated to others. His pretended proof of the first position is nothing less than a subtle play with the dialectic of the Eleatics, as carried out to its extreme consequences by Zeno and Melissus. There is much more of originality in the arguments which he advances to support the other two: thus, in respect to the second, he urged that if being is conceivable, every conception must be an entity, and the non-being inconceivable; while, in the third case, he showed that as language is distinct from its object, it is difficult either to express accurately our perceptions or adequately to convey them to others. Now, however sophistical may have been the purpose for which all this was advanced, still it is no slight merit to have been the first to establish the distinction between conception and its object, and between the word as the sign of thought and thought itself. By thus awakening attention to the difference

between the subject and the object of cognition, he contributed largely to the advancement of philosophy.

In these arguments however, and generally in his physical doctrines, Gorgias deferred in some measure to the testimony of sense which the stricter Eleatics rejected absolutely as inadequate and contradictory: on this account, although the usual statement which directly styles him the disciple of Empedocles is erroneous, it is probable that he drew from the writings of that philosopher his acquaintance with the physiology of the Eleatic school.

Subsequently it would appear that Gorgias devoted himself entirely to the practice and teaching of rhetoric; and in this career his professional labours seem to have been attended both with honour and with profit. According to Cicero ('De Orat,' i. 22; iii. 32), he was the first who engaged to deliver impromptu a public address upon any given subject. These oratorical displays were characterised by the poetical ornament and elegance of the language and the antithetical structure of the sentence, rather than by the depth and vigour of the thought; and the coldness of his eloquence soon passed into a proverb among the ancients. Besides some fragments, there are still extant two entire orations, ascribed to Gorgias, entitled respectively 'The Encomium of Helen,' and 'the Apology of Palamedes,' two tasteless and insipid compositions, which may however not be the works of Gorgias. On this point consult Foss ('De Gorgia Leontino Commentatio,' Halle, 1828), who denies their authenticity, which is maintained by Schönhorn ('De Authentici Declamationum quæ Georgiæ Leontini nomine extant,' Breslau, 1826).

* GORTSCHAKOFF. There are three Russian princes, brothers, of this name: two of them have distinguished themselves as military commanders, and one as a diplomatist. They are descended from a noble family of great antiquity.

* PRINCE PETER GORTSCHAKOFF was born about 1790. He was engaged in the campaign against France in 1813-14, and was afterwards employed in the Caucasus under General Yermoloff. In 1826 he was appointed quarter-master-general of the army commanded by Wittgenstein, under whom, in the Russian war with Turkey, he commanded a division of infantry, and signed the treaty of peace at Adrianople. He was afterwards advanced to the rank of lieutenant-general, and in 1839 was made governor of Eastern Siberia. In 1843 he was promoted to the rank of general of infantry, and in 1851 retired from service.

* PRINCE MICHAEL GORTSCHAKOFF was born in 1795. In 1828 he served in the artillery of the Russian imperial guard, and was made chief of the état major of the corps under Rudewich, and later under Krasowski, and directed the operations of the sieges of Silistria and Schumla in 1828-29. During the campaign in Poland in 1831, he discharged the duties of chief of the état major under count Pahlen, at the same time that he held the command in chief of the artillery. He particularly distinguished himself at the battle of Ostrolenka and at the taking of Warsaw. He was wounded at the battle of Grochow, and was rewarded for his bravery with the rank of lieutenant-general. On the retirement of Count Toll he succeeded him as chief of the general staff of the entire army, a situation which he still retains. In 1843 he was raised to the rank of general of artillery, and in 1846 was appointed military governor of Warsaw. He commanded the Russian armies which occupied the Danubian Principalities in 1853. On the 23rd of March 1854, the Russian army crossed the Danube at three points—at Galatz, under Lüders; at Braila, under Gortschakoff himself; and at Ismail by a corps under Uschakoff. He conducted the operations till he was superseded in April by Prince Paskiewitch, who having been wounded before Silistria on the 8th of June, resigned the command in chief to Prince Gortschakoff. In the month of July the siege of Silistria was raised, and the Russian armies re-crossed the Danube. In the month of August they quitted the Danubian Principalities, and withdrew within the Russian frontier. In March 1855 he was appointed to succeed Prince Menschikoff in the command of the Russian forces in the Crimea. He superintended the protracted defence of Sebastopol, and with consummate skill secured the final retreat of the Russian troops from the blazing ruins of the fortress.

* PRINCE ALEXANDER GORTSCHAKOFF was born in 1800. He was educated for the career of diplomacy in which he has been always occupied. In 1824 he became secretary to the Russian embassy in London. In 1830 he was chargé d'affaires at Florence. In 1832 he was appointed counsellor to the Russian embassy at Vienna. In 1841 he was sent to Stuttgart as envoy extraordinary, and negotiated the marriage of the Grand-Duchess Olga with the Prince-Royal of Wurtemberg. He remained at Stuttgart as Russian envoy to the German diets, which were occasionally held, till he was recalled in June 1854, to receive special instructions from the Emperor Nicholas for the special mission to Vienna, with which he was charged in July 1854. He continued at Vienna occupied with the negotiations for peace between Russia and the western powers till the conferences finally ceased in 1855.

GOSLICKI, LAURENTIUS, a learned Pole, who lived in the 16th century. Having commenced his studies at Cracow, he continued them at Padua, where he published his work 'De Optimo Senatore,' which was printed at Venice, and published at London, 1733, 4to, under the title of the 'Accomplished Senator Laurentius Goslicki Bishop of Posnania,' done into English by William Oldisworth. The

translator gives in his notes a parallel between the Polish and English constitutions. Goslicki entered the church, became bishop of Posnania, and was frequently employed in many political affairs.

*GOSSE, PHILIP HENRY, F.R.S., was born at Worcester in 1810. He early evinced a great love for natural history, but was at the outset of life engaged in commercial occupations. He went to Newfoundland in 1827, remained there eight years, then stayed three years in Canada, and afterwards travelled in the United States. During his stay in these countries he devoted great attention to natural history, and soon after his return to this country published the 'Canadian Naturalist.' This work, the result of his observations in the districts to which it relates, contains many charming descriptions of natural scenery and objects. He afterwards visited Jamaica, and on his return wrote and published a little volume on 'The Birds of Jamaica.' This was followed by a larger work, published in 1849, and entitled 'Illustrations of the Birds of Jamaica.' He also enriched the pages of the Annals and Magazine of Natural History by an account, in a series of articles, of the insects of Jamaica. In the year 1849 he published a general work, entitled an 'Introduction to Zoology.' In 1850 he was employed by Mr. Lovell Reeve to write a volume in his series of natural history works, which was published with the title 'Popular British Ornithology.' In 1851 he published a further account of his experience in the pursuit of natural history in Jamaica, and gave a very interesting account of his residence there: the work was entitled 'A Naturalist's Sojourn in Jamaica.' Besides these, he had been engaged in writing several volumes on natural history for the Society for Promoting Christian Knowledge. Mr. Gosse, having repaired to the Devonshire coast for the benefit of his health, soon collected enough information, with regard to marine animals, to publish, in 1853, another work, entitled 'Rambles of a Naturalist on the Devonshire Coast,' illustrated with 28 plates from Mr. Gosse's own drawings. In this work the author gave his experience of keeping creatures in vessels filled with sea-water. This arrangement, which has since been more correctly called an Aquavivarium, he named an Aquarium. In 1854 he published a work on this subject, with the title, 'The Aquarium, or Unveiling of the Wonders of the Deep Sea.' It was illustrated with a number of coloured plates, and served greatly to encourage a taste for the cultivation of plants and animals in vessels filled with sea-water. Mr. Gosse has lately published the first part of a work entitled 'A Manual of Marine Zoology for the British Isles.'

Whilst Mr. Gosse has been thus usefully employed in writing works which have diffused widely a taste for the study of natural objects, he has not neglected original observations, and has obtained for himself a high position as a scientific and accurate observer. Amongst his contributions to science which deserve this character are his papers on Insects, in the 'Annals and Magazine of Natural History,' and his papers on the structure and functions of the *Rotifera*, in the 'Transactions of the Microscopical Society,' and the 'Philosophical Transactions.' In consequence of these latter papers Mr. Gosse was elected a Fellow of the Royal Society in June 1850.

GOSSÉLIN, P. F. J., a distinguished geographer, born in 1751, at Lisle. From 1772 to 1780, he travelled in different parts of Europe engaged in geographical and antiquarian researches. At the beginning of the revolution he was returned by his province as a deputy to the national assembly, and in 1791 was nominated by the king a member of the central administration of commerce. The Committee of Public Safety employed Gosselin in the department of war. In 1799 he received a place in the cabinet of medals at Paris, which he retained till his death in 1830. His principal works are 'Géographie des Grecs analysée,' Paris, 1790, in quarto, with ten maps, and 'Récherches sur la Géographie systématique et positive des Anciens,' 4 vols., Paris, 1798 to 1813, in 4to, with 54 maps. The researches contained in these works throw great light on the geographical knowledge of the ancients. Gosselin also assisted in the translation of Strabo, which was undertaken by the order of the French government, and published at Paris, 1805 to 1819, in 5 vols.

GOSSON, STEPHEN, a native of Kent, was born in 1554. In 1572 he was entered at Christchurch, Oxford, where he took his Bachelor's degree, and then removed to London. He was there a family tutor, and wrote three plays—a tragedy called 'Catinine's Conspiracies,' a comedy called 'Captain Mario,' and 'Praise at Parting,' a moral play. These plays were never printed, and would now be quite unknown but for the remorseful mention which the author himself afterwards made of them. He was but twenty-five years old when he published one of the most curious, and the second in order of time, of the Puritanical tracts inveighing against plays and stage-playing. This was 'The Schoole of Abuse, containing a pleasant invective against Poets, Pipers, Plaiers, Iesters, and such like Caterpillers of a Commonwealth,' 1579-87. This pamphlet, more scurrilous than either pleasant or logical, was reprinted by the Shakspeare Society in 1841. It was followed in the same year by Gosson's miscellaneous volume, called 'The Ephemerides of Phialo' (reprinted in 1586), one part of which, 'A Short Apologie of the Schoole of Abuse against Poets, Pipers, Players, and their Excusers,' was directed against Thomas Lodge's 'Reply to Stephen Gosson touching Plays.' Both of these works of Gosson were dedicated to Sir Philip Sidney, who, according to Spenser, scorned the writer for his labour. He took up the argument again, with violent personal abuse of Lodge, in his 'Plays confuted

in Five Actions,' published in 1581 or 1582, and dedicated to Sir Francis Walsingham. Another work of Gosson is the 'Pleasant Quippes for Upstart Newfangled Gentlemen,' printed in 1595, and again in 1596; a versified composition containing some hard satirical hits, but no poetry. His only other known effusions are verses prefixed to three works of his day, and a sermon called 'The Trumpet of War,' which was printed in 1598. Gosson had then taken orders, and was parson of Great Wigborough in Essex. In 1600 he was instituted to the rectory of St. Botolph, Bishopsgate; and it is a curious fact that there exists a letter of his dated in 1616, in which, with expressions of respect, he recommends to Edward Alleyn the player three poor people for admission to Dulwich Hospital. Gosson held the rectory of St. Botolph at his death, which took place in his parish on the 13th of February 1623.

GÖTHE, JOHANN WOLFGANG VON, was born at Frankfurt-on-the-Maine on the 28th of August 1749. The history, or rather the poetical account, which he has given of his own life in the book entitled 'Dichtung und Wahrheit: aus meinem Leben,' enables the reader to trace from early childhood the mental development of this extraordinary man. The taste of his father (who was a man in comfortable circumstances) for literature and works of art, and the sensation created by the breaking out of the Seven Years' War, had a great influence on his mind, and had the effect of forming him to habits of reflection. In early years he seems to have had anxious thoughts about religion, and before he had attained the age of eight he devised a form of worship to the 'God of Nature,' and actually burned sacrifices. Music, drawing, natural science, the study of languages, all had charms for him; and to further his proficiency in language, he wrote a romance, wherein seven sisters corresponded each in a different tongue. He soon turned his attention to poetry, and composed songs for the amusement of some young persons with whom he had become accidentally acquainted. These young persons however turned out to be bad characters, and his connection with them was broken off. The intimacy led to his feeling for the first time the passion of love. Gretchen (Peggy), who gave a name to the heroine of 'Faust,' was the object of his early passion; she was related to one of his young friends, and seems to have been a sensible well-inclined girl, who would have warned him from her own circle of acquaintance. After the connection was broken off, he never saw her again: a severe fit of illness was the consequence of this separation. Shortly after his recovery he was sent to the University of Leipzig, where Gottsched, who favoured the French school, Ernesti, and Gellert, were leading men. Here his decided poetical turn first became manifest; and though his father designed him to study jurisprudence, instead of devoting himself to this pursuit, he looked around him, in order to learn or discover some satisfactory theory of poetry. But it was the infancy of German literature: he could find no certain criterion of taste, and this prompted him to look within himself. "Here began," says he, "that tendency, from which I did not depart all my life, to turn everything which pleased or pained me into a song." A little piece called 'Die Laune des Verliebten' ('The Lover's Whimsicality') appeared at this time, as well as a comedy called 'Die Mitschuldiger' ('The Accomplices'), which was designed to exhibit the immorality of private life concealed under a smooth outside. He also paid attention to the history of the fine arts: Winckelmann was his favourite author. He even made some attempts at etching; but the exhalations of the acid impaired his health, and he had hardly recovered in 1768, the year in which he left Leipzig. To restore him to strength, he was sent to the residence of a lady named Klettenberg, the 'fair saint,' whose confessions are recorded in 'Wilhelm Meister.' She was a mystic: her society led Göthe to study the alchemical and cabalistic authors; and he even had thoughts of founding a new religion, to be based on the Alexandrian philosophy. These strange pursuits made him turn his attention to natural science, and when he went to Strasbourg to finish his legal studies he neglected jurisprudence for chemistry and anatomy. Here he became acquainted with Herder, who advised him to peruse the Italian poets. On his return home he published the play of 'Götz von Berlichingen' (1773) and the novel of 'Werther' (1774), which excited a sensation over all Germany. The Prince of Weimar made his acquaintance, and on assuming the government invited him to his court. He went to Weimar in 1775, and in 1779 was made a privy-councillor (Geheimrath), and in the same year accompanied his prince to Switzerland. In 1786 he travelled into Italy, where he remained two years. Subsequently he became one of the ministry, received honourable marks of distinction from different sovereigns, and closed a long life, devoted entirely to science, literature, and art, in 1832.

As this brief sketch of Göthe's life has not given a view of the order of his works, we shall here notice them nearly in their chronological arrangement.

'Werther,' which was one of his earliest productions, was occasioned by the suicide of a young gentleman named Jerusalem. It is written with immense power and energy, of which the flat English translation affords a very inadequate idea.

'Götz von Berlichingen' is less a drama than a series of dramatic scenes, which give an almost pictorial view of the times of the Emperor Maximilian. The character of Martin Luther, yet a monk, the Bauernkrieg (war of the peasants), the Fehmgericht, or secret tribunal,

are exhibited with a graphic accuracy which, considering the age of the author, is wonderful. The character of Götz, an old German knight, who lives to see civil rights overpower the old club-law, is most interesting, while his fate excites our deepest sympathy. The characters of Adelaide, an intriguing court-lady, and Francis, an amorous page, display great knowledge of human nature. A translation of this piece was one of Sir W. Scott's earliest works.

The drama of 'Egmont' is immortalised by the character of Clara, which is a most beautiful picture of feminine constancy and devotion.

These works, together with a variety of small poems, may be reckoned as the prototypes of one class of his writings. The small poems are the exact illustration of that habit which has been already noticed. A single thought, and that a very trivial one, often forms the sole subject of a lyrical piece; yet these thoughts are so true to nature, and are so perfectly suited to the subject, as to render these little effusions perhaps the most delightful of all his works. To the same class may be referred 'Clavigo,' a domestic tragedy, and 'Stella,' a sentimental comedy with rather an equivocal moral.

The second order of works consists of those which were written at a later period of life, the prototypes of which are classical models. 'Iphigenia auf Tauris' stands at the head of this class, and is universally admitted to breathe a more truly Greek spirit than any work of modern times. It is a master-piece of its kind; the antiquity of its aspect does not consist in a blind regard for ancient forms, for it has not even the chorus of the ancient drama, but the very thoughts are cast in a classic mould. Professor Hermann, of Leipzig, has turned parts of this drama into Greek. 'Torquato Tasso' is another piece of the same kind, which represents the contrary positions of a poet and a man of the world. His 'Epigrams from Venice' and his 'Elegies' also bear the classic stamp, and, though frequently licentious, are excellent as being a repetition of the spirit of the Roman elegiac and amatory poets.

Three works of Göthe stand prominently forth, which it is difficult to place in any class; these are 'Wilhelm Meister's Apprenticeship,' 'Hermann and Dorothea,' and 'Faust.' The first is a novel, which contains many valuable critical remarks (particularly on Shakspeare's 'Hamlet'), but its main purpose is to exhibit the progress of a young man who, though at first ignorant of the world and filled with the most romantic ideas, ends with being an accomplished gentleman. It exhibits a wonderful insight into the springs of action, and many of the scenes give curious pictures of German life. The character of Mignon has been the origin of Sir W. Scott's Fenella in 'Feveril of the Peak,' and of Esmeralda in Hugo's 'Notre Dame.' In some respects it is the most remarkable of Göthe's works. To English readers it is well-known by Carlyle's characteristic translation.

'Hermann and Dorothea' is a kind of idyllic epos; the subject is merely a love story in a small town; the pictures are drawn from humble life, but the style is Homeric, and the plot artfully interwoven with the French Revolution. J. H. Voss had previously written his idyll 'Luise' also in hexameters, and in imitation of the Greek style; but Hegel, professor of philosophy at Berlin, ingeniously pointed out the difference between the two works, and showed that 'Luise' is a mere domestic idyl, while the subject of 'Hermann and Dorothea' is not so exclusively confined to family life as to shut out the prospect of the important events of Europe.

'Faust' is a work too generally known, and requires too particular a comment to be dwelt on here. It is sufficient to say that it represents the agony of a student who is toiling after knowledge beyond his reach, and who afterwards deserts his studies and plunges into a course of sensuality. This remarkable work exhibits all Göthe's various tendencies as it were concentrated into one focus; and beyond any other recent work has exercised the skill of commentators and critics.

A new form of the old poem of 'Reynard the Fox,' in hexameter verse, a number of small dramatic pieces, and, above all, the delightful biography entitled 'Dichtung und Wahrheit: Aus meinem Leben,' (Truth and Poetry: from my Life), possess the highest merit.

The later writings of Göthe, such as the second part of 'Faust,' 'Pandora,' &c., differ widely from his earlier works. They are generally imitations of antique forms, whether or not they possess the true poetic spirit is a matter of warm dispute. Oriental scholars greatly admire his 'West-eastern Divan,' a collection of poems in the Persian style; and there are some beauties in the novel 'Die Wahlverwandtschaften' ('The Affinities').

To understand Göthe's greatness, we must observe that he may almost be regarded as the creator of German literature. Before his time little had been written in the language that was characterised by a decided superiority of thought or style. During the whole of his long life he was in correspondence with the chief authors of his day, and he thus exercised no small direct influence on the literary labours of others.

The universality of Göthe's genius is one of the most striking parts of his literary character. No writer ever attempted such a variety of kinds, and succeeded in all. In 'Götz' we find an historical dramatist going beyond Shakspeare in irregularity; in 'Werther,' that species of sentiment which used to be called 'German' some thirty years ago; and in 'Iphigenia,' the strictest attention to Greek rules of art, and

a polished elegance which an Athenian would have admired. Notwithstanding his ardent pursuit of every branch of literature, he was scarcely less distinguished for proficiency in every species of natural science, to which a number of scientific works, with his 'Theory of Colours' at their head, bear testimony; and not only was he a writer on science, his speculations on the metamorphoses in plants, and on osteology, are now admitted to be suggestive of truths as important as they were original.

Göthe was enthusiastic in his admiration of the beautiful wherever it could be found, whether in poetry, painting, architecture, music, engravings, statues, or gems, and has left numberless aphorisms of the greatest value to those who cultivate the fine arts. No petty jealousy seems to have stood in the way of this admiration for the beautiful; to the works of every class and of every country he gave what he considered their due tribute of praise.

Göthe has been blamed for having mingled too little in practical life, and for not attending sufficiently to the interests of his country; but probably he knew his capacities better than his judges, and felt that by cultivating the taste of his countrymen he was conferring a more important benefit than by mixing in politics. A very good poet may be a very bad politician. In life and opinions he was a decided aristocrat, though raised from a comparatively humble station. While he admitted the insincerity, he admired the elegance of the court; and as he always shone in polished society, it is no great wonder that he preferred it.

Though many of his poems are highly metaphysical, he had never penetrated deeply into the philosophical writings of his countrymen. The works of Spinoza had a great influence on his religious opinions: he loved to consider the Deity rather in than beyond nature, and of this pantheistic tendency many of his works are exponents.

There is perhaps no author in the world whose mind we have such an opportunity of studying accurately as that of Göthe. Not only have we his numerous works, every one of which illustrates some peculiar mental state; not only have we a biography by himself, which has been elucidated and annotated by singularly minute and painstaking commentators, but there is also a host of publications containing correspondences, characteristics, and conversations, all throwing light on this great man's character, and exhibiting him in every possible relation. His correspondence with Schiller, with Zelter, with a child (Bettine Brentano), the little tracts which have been translated by Mrs. Austin and published under the name of 'Characteristics of Göthe,' and the conversations with Eckermann (a sort of German Boswell), are replete with amusement and instruction.

Several complete editions of Göthe's works have been published by Cotta of Stuttgart and others; and an excellent and cheap edition, in 5 vols. royal 8vo, at Paris.

GOTHOFREDUS. DENYS GODEFROY, born at Paris in 1549, studied at Louvain, Cologne, and other universities, and was made councillor of the Châtelet at Paris. Being obliged to leave France on account of the persecutions against the followers of the reformed religion, which he professed, he went to Geneva, where he was made professor of law in 1580. In 1589 Henri IV. appointed him bailli, or governor, of the district of Gex, bordering on Geneva; but he was driven thence by the arms of the Duke of Savoy, on which occasion he lost his books and other property. In 1594 he was appointed to the chair of law at Strasbourg, and in 1604 he removed to Heidelberg, where he filled the same professorship. In 1621, being driven from Heidelberg by the war in the Palatinate, he withdrew to Strasbourg, where he died in the following year, with the reputation of being the first jurist of his age. His edition of the 'Corpus Juris Civilis,' 2 vols. fol., has often been reprinted: the notes are valuable. Among his numerous other works on law the following deserve mention:—1, 'Fontes Juris Canonici'; 2, 'Praxis Civilis ex Antiquis et Recentioribus Scripturis'; 3, 'Index Chronologicus Legum et Novellarum à Justiniano Imp. Compositarum'; 4, 'Questiones Politicæ ex Jure Communi et Historia assumptæ'; 5, 'Dissertatio de Nobilitate'; 6, 'Consuetudines Civitatum et Provinciarum Gallicæ, cum Notis'; 7, 'Statuta Regni Gallicæ, juxta Francorum et Burgundionum Consuetudines cum Jure Communi collata et Commentariis illustrata'; 8, a Greek and Latin edition of the 'Promptuarium Juris' of Harmenopolus. He wrote also on classical literature:—9, 'Notæ in Ciceronem'; 10, 'Conjecturæ, varis Lectiones, et Loci Communes in Seneca'; 11, 'Auctores Lingue Latine in unum redacti Corpus,' with notes; 12, 'Antiquæ Historiæ libri sex,' being a compilation from Berosus, Manetho, Cato, and other ancient historians. He wrote likewise a controversial work on a subject of peculiar interest in his time, 'Maintenue et Défense des Empereurs, Rois, Princes, États, et Républiques, contre les Censures, Monitoires, et Excommunications des Papes.' His minor works, 'Opuscula,' were published together in 1 vol. fol. Sénebier, 'Histoire Littéraire de Genève,' gives a catalogue of all the works of Denys Godefroy, with a biographical notice of the writer.

GOTHOFREDUS. JACQUES GODEFROY, son of Denys, was born at Geneva in 1587. In 1619 he was appointed professor of law at Geneva, and afterwards was made councillor of state; he also filled various other important offices of that republic, and was sent upon several foreign missions, all of which he discharged to the satisfaction of his countrymen. He was deeply versed in the study and history of jurisprudence in all its branches, was an accomplished classical

scholar, and upon the whole was one of the most distinguished men that Geneva has produced. His principal work, about which he laboured for thirty years, and which was published after his death, is his edition of the Theodosian code, or collection of the Roman law as promulgated by Theodosius the younger, A.D. 438. This Theodosian code contains the edicts and rescripts of sixteen emperors, from the first Constantine to Theodosius himself; it is divided into sixteen books, and the laws are arranged in chronological order. An abridgment of this code is contained in the 'Breviarium' of Anianus, a compendium of the Roman law, compiled in 506, by order of Alaric, for the use of his Roman subjects. Several editions of the Theodosian code, all of them more or less defective, were published in the 16th century. The edition of Gothofredus, entitled 'Codex Theodosianus cum perpetuis Notis,' 6 vols., fol., 1665, is a master work of its kind. To the text of the Code Godefroy subjoins the ancient explanation, followed by his own notes, in which he adverts to the various readings, and to the parallel or conflicting passages in the Theodosian and Justinian Codes; and he completes the illustration of each title by an ample commentary on the scope and tendency of the various enactments, presenting the reader with an immense mass of erudition, classical, historical, and juridical. He has moreover prefixed to the first volume a 'Chronologia Codicis Theodosiani,' followed by 'Prolegomena' on the same, concerning the history of the Code. The last volume contains 'Notitia Dignitatum seu Administrationum tam Civilium quam Militarium Imperii,' a 'Prosopographia,' or notice of all persons mentioned in the Code, a 'Topographia, sive Orbis Romanus ex Cordice Theodosiano descriptus,' and a 'Glossarium Nomicum Codicis Theodosiani.' All these accessory tracts are so many mines of most valuable information. Gibbon, in the 'Memoirs of his own Life,' acknowledges the great obligations he owed to Godefroy's labours while composing his own 'History of the Roman Empire,' and he styles his edition of the Theodosian Code 'a full and capacious repository of the political state of the Empire in the 4th and 5th centuries.' About seventy years after the appearance of Godefroy's work, Professor J. D. Ritter republished it with various additions, in 7 vols. fol., Leipzig, 1736-45. Since that time inedited fragments of the Theodosian Code have been discovered in the Ambrosian and Turin libraries, filling up many lacunæ in the first five books. 'Codicis Theodosiani libr. v. priores: recognovit, additamentis insignibus a W. F. Clossio et Amedeo Peyron repertis aliisque auxit, notis subitaneis tum criticis tum exegeticis instruxit Car. Frid. Christianus Wenck.' 8vo., Leipzig, 1825. The most complete edition of the text of the Theodosian Code is that edited by Hanel in the 'Corpus Juris Ante-Justinianum,' Bonn, 1837.

Among the numerous other works of Jacques Godefroy, the following are the most esteemed:—1, 'Manuale Juris;' 2, 'Fontes quatuor Juris Civilis, containing fragments of the Twelve Tables,' with notes; 3, 'De Statu Paganorum sub Imperatoribus Christianis;' 4, 'Opusculum de Imperio Maris et de Jure Naufragii colligendi, Lege Rhodia;' 5, 'Notæ in Tertulliani "Ad Nationes," libros duos ineditos;' 6, 'V. Orationes Libanii Sophistæ primum veste Latina donatæ;' 7, 'III. Orationes; de Statu Germaniæ, de Causa Odii Juliani in Christianis, de Causis Achæorum Republicæ Interitus;' 8, 'Dissertatio de Suburbicariis Regionibus et Ecclesiis;' 9, 'Fragmenta Legum Juliarum et Pappie collecta et Notis illustrata.' He also edited 'Philostorgii Cappadocis Ecclesiasticæ Historiæ, libri xii.,' and 'Vetus Orbis Descriptio Græci Scriptoris sub Constantio et Constante Imperatoribus,' in Greek and Latin. Godefroy wrote in French, 'Le Mercure Jesuitique, ou Recueil de Pièces concernant les Progrès des Jesuites depuis 1620.' Godefroy died at Geneva in 1652. His juridical works, except his illustrations of the Theodosian Code, were collected by Troitz, fol., Leyden, 1733, with a notice of the author.

* GOUGH, HUGH, VISCOUNT, G.C.B., a general in the British army, is of Irish extraction. His father, the late George Gough, Esq., of Woodstown, Limerick, was the great-grandson of Dr. Francis Gough, a bishop of that see in the 17th century. He was born in 1779. Being a younger son, he adopted the military profession, and entered the army in 1794 as ensign in the 34th foot. It was not long before he entered upon active service. In the following year he took part with his regiment in the capture of the Cape of Good Hope and of the Dutch fleet in Saldanha Bay, and subsequently in the campaign in the West Indies, including the attack on Porto Rico, the brigand war in St. Lucia, and the taking of Surinam. Having obtained his majority in the 87th regiment (the Prince of Wales's Irish), he went out to the Spanish peninsula in 1809, and commanded that corps at the battles of Talavera, Barossa, Vittoria, Nivelle, Cadiz, and Tarifa; for his gallant conduct in which engagements he received a medal, with an heraldic augmentation to his armorial bearings. At Tarifa he was severely wounded, as he was also subsequently at Nivelle; and again at Talavera, where he had a horse shot under him. For his conduct on this occasion, the Duke of Wellington recommended that his lieutenant-colonelcy should be ante-dated to the date of his despatch, thus making him the first officer who ever received brevet-rank for services performed in the field in command of a regiment. At Barossa his regiment captured the eagle of the 8th regiment of French troops, and the baton of Marshal Jourdan at Vittoria. He became a major-general in 1830, and went out to India in 1837 to take command of a division of the Indian army. He had not however been long there

when he was ordered to proceed to China to take the command-in-chief of the British troops employed in that country. He held this command at the attack on Canton, and for his services on that occasion he was made a G.C.B. He continued to hold this post during the entire series of operations in China, including the capture of Amoy. The war was concluded by the signature of the treaty entered into at Nankin in August 1842. For his services in these parts he was created a baronet towards the close of the same year, and was honoured with the thanks of both houses of parliament. Returning to India, he assumed in the following year the post of commander-in-chief of the British forces there, and found a field for reaping fresh laurels in the following year. In December 1843 he took command in person of the army in the campaign against the Mahrattas, which terminated in the victory of Maharajpore, when, with the right wing of the army of Gwalior, he defeated the Mahratta forces and captured upwards of 50 guns. In 1845 and the following year he found a fresh enemy in the Sikhs, whom he defeated successively, with the assistance of the governor-general, Lord Hardinge, at Moodkæ, Ferozeshah, and Sobraon. For his gallant conduct in this bloody and most important war, he again received a vote of thanks from both houses, and was also raised to the peerage as Baron Gough, in April 1846. In the last desperate struggle with the same fierce enemies, in 1848-49, Lord Gough showed the greatest bravery and decision, and finally drove them back within their own territories, having gained over them the great victory of Goojerat, though at a heavy cost of life. For this achievement he was again publicly thanked by the assembled Houses of Parliament, and elevated to the viscountcy, the East India Company settling upon him a pension of 2000*l.* a year, to which a similar sum was added by the legislature. Having returned to England in the latter year, he has not since undertaken any active employment. He was appointed to the colonelcy of the 87th foot in 1841, and to that of the Royal Horse Guards in 1854, on the death of the Marquis of Anglesey. (*Burke's Peerage; Hart's Army List; The Three Presidencies of India.*)

* GOUGH, JOHN B., who has acquired celebrity as a lecturer on Temperance in America and in Great Britain, was born at Sandgate, in Kent, on the 22nd of August 1817. His father, who was a soldier in the 40th and 52nd regiments of foot, obtained his discharge with a pension in 1823. John received his elementary instruction from his mother, who taught the village school. He subsequently attended a school in Folkestone. When he was twelve years old he was sent to America as an apprentice to a tradesman who was about to proceed there. With this person, who settled on a farm in Oneida county, in the state of New York, he remained for about two years, till, seeing little prospect of learning a trade, he wrote to his father, and having obtained his permission, he quitted Oneida county, and took up his abode in the city of New York. Here he obtained employment in the Methodist Book-room, and was enabled to send to England for his mother and sister, who joined him in August 1833; his father declined the invitation, as he did not wish to lose his pension. Scarcity of employment during the winter of 1833 reduced Gough and his mother and sister to deep distress, and in July 1834 his mother, to whom he was greatly attached, died. Shortly after this event Gough became associated with young men of convivial dispositions, to whom his social qualities made him an acquisition. He frequently attended the theatre, and for some time was engaged as a comic singer and an actor. His love of company led him into habits of intemperance, and he was thus frequently thrown out of employment. In 1839 he married, and commenced business on his own account as a bookbinder; but his love of company and strong drink prevented him from succeeding. He subsequently experienced dreadful suffering from more than one attack of *delirium tremens*; and his distresses were aggravated by the death of his wife and child. He was reduced to a very miserable condition, when a stranger spoke to him in the street, and asked him in a kindly manner to sign the temperance pledge; to this he consented. His talents for public speaking soon became known to the friends of the temperance cause, and his services were much in request. His first lecture was delivered on the 26th of December 1842. About five months subsequently he was induced by some of his former drinking companions to violate his pledge, and this was the cause of much unhappiness to him. He re-signed however, and resumed the course of public advocacy of Temperance principles, which up to the present time he has pursued with remarkable success. In August 1853 Mr. Gough, accompanied by his wife, whom he had recently married, came to England on the invitation of the London Temperance League, and continued in this country for two years, lecturing in Exeter Hall and other large buildings in London, visiting also the principal towns in England and Scotland, creating a marked impression wherever he went, and attracting large audiences to listen to his eloquent addresses. Mr. Gough has received numerous testimonials from individuals and societies, both in America and in Great Britain, in acknowledgment of his labours on behalf of the Temperance cause; and his services as a public lecturer have likewise been remunerated on a very liberal scale. He was under engagement to the Temperance League in this country to resume his public advocacy in August 1856, but having become exhausted by his labours in America in the spring of the year, his medical advisers have enjoined retirement from the excitement of public speaking for a few months.

Mr. Gough's extraordinary power as a public speaker arises chiefly perhaps from his possession of the combined qualifications of actor and orator, as well as from the earnestness of feeling by which his addresses are characterised.

GOUGH, RICHARD, an eminent English antiquary, son of Henry Gough, Esq., was born in Winchester-street, London, October 21, 1735. He became a fellow-commoner of Bene't College, Cambridge, in July 1752, but left the University in 1756, without taking a degree. He was elected F.S.A. in 1767, and in 1771, upon the death of Dr. Gregory Sharpe, Master of the Temple, was chosen director of the society, an office which he held till 1797. He was elected F.R.S. in 1775. Mr. Gough's first publication of importance was his 'Anecdotes of British Topography,' 4to., Lond., 1768, reprinted and enlarged in 2 vols. 4to., 1780. In 1773 he formed the design of a new edition of Camden's 'Britannia,' which he had partly begun to translate before, and for the purpose of making additions to which he had for years made regular excursions through the different counties of England, Wales, and Scotland. His edition of the 'Britannia' was at length published in 1789, in three volumes folio; reprinted in four volumes folio, 1806. In 1786 he published the first volume of the 'Sepulchral Monuments of Great Britain, applied to illustrate the History of Families, Manners, Habits, and Arts, at the different Periods from the Norman Conquest to the Sixteenth Century.' This splendid volume in folio, which contains the first four centuries, was followed in 1796 by a second, containing the fifteenth century; and in 1799 by an Introduction to the second volume, with which he thought proper to conclude his labours, instead of continuing them to the sixteenth century, as he first intended.

Among his publications of a minor kind were 'An Account of the Bedford Missal,' 'The History of Pleahy, in Essex,' 4to., 1803, and in the same year, 'An Account of the Coins of the Seleucids, Kings of Syria,' 4to.

He was also the improver and editor of Martin's 'History of Thetford,' 4to., 1780; published a new edition of Vertue's 'Medals, Coins, and Great Seals,' by Simon; and in the same year contributed a preface and glossary to Mr. Nichols's collection of 'Royal and Noble Wills,' 4to.

Mr. Gough drew up, at the united request of the president and fellows, the 'History of the Society of Antiquaries of London,' prefixed to the first volume of their 'Archæologia,' in 1770; and to the eleven succeeding volumes of that work, as well as to the 'Vetusta Monumenta,' he contributed numerous valuable memoirs. He was equally liberal to Mr. Nichols's 'Bibliotheca Topographica Britannica,' and to his 'History of Leicestershire.'

Mr. Gough died February 20, 1809, and was buried in the churchyard of Wormley, in Hertfordshire. By his last will he bequeathed to the University of Oxford all his printed books and manuscripts on Saxon and Northern literature; all his manuscripts, printed books, prints, maps, and drawings illustrative of or relating to British topography; his interleaved copies of his three greater works already mentioned, and all his unengraved drawings of sepulchral monuments; with fourteen volumes of drawings of sepulchral and other monuments in France; the engraved copper-plates of his greater works, &c. The remainder of his library and collections were sold by auction in 1810 and 1812; the printed books producing 3,552l. 3s.

(*Biog. Pref.* to the Catalogue of Mr. Gough's Library; Nichols, *Literary Anecdotes*.)

GOUJON, JEAN, a celebrated French sculptor, born in Goujon, is sometimes called the Correggio of sculptors, from the softness and delicate roundness of his execution, especially in basso-relievo, in which he was excellent; he is also sometimes termed the father of French sculpture. Many of his works have perished, but two of the best still remain: the bassi-relievi of the Naiades of the Fontaine des Innocents, and the four colossal Caryatides in the Louvre, in the Salle des Cariatides, so named from Goujon's works, built in the reign of Henri II. Goujon was also an architect; he was architect to the king, and was appointed, conjointly with Pierre Lescot, to superintend the building of the Louvre. He was employed also in other works by Henri II.; and he made for him a large naked statue of his mistress, Diana of Poitiers (the Duchess of Valentinois), which is now in the Louvre, in the Salle d'Angoulême. The figure, which is reclining and resting against a stag, has been extravagantly praised; but it is neither well proportioned, nor does it possess any fine development of form characteristic of the female: it is long, and wants undulation of line; but this peculiarity might be supposed to belong to the individual, were not the nymphs of the Fontaine des Innocents conspicuous for the same defects, which shows that they are defects of manner. The accessory parts of his works are elaborately executed. Goujon was a Huguenot, and fell a victim to the massacre of St. Bartholomew, in 1572; he was shot while on a scaffolding, working upon some bassi-relievi at the Louvre. His remaining works have been engraved and published in large octavo, by A. Reveil, 'Œuvres de Jean Goujon, gravé au trait d'après ses Statues,' &c., Paris, 1829. (D'Argenville, *Vies des fameux Architectes et Sculpteurs*, &c.; Dandré Bardon; Watelet; Reveil et Duchesne; &c.)

* GOULD, JOHN, a celebrated naturalist, was born on September 14, 1804, at Lyme in Dorsetshire. He early displayed a fondness for objects of natural history, and particularly for birds, of which he began

to prepare stuffed specimens for sale while yet a youth. He was at that time residing at Eton, and was even then noticed for the assiduity and intelligence with which he pursued his favourite study. On the verge of the neighbouring forest, or in a boat in one of the many creeks of the Thames, with his gun and a book, he might be seen patiently watching for some desired specimen, which when secured was carefully prepared and added to his collection. His skill in these preparations was remarkable; the life-like attitude and natural positions of the birds were admired by all who saw them; but Mr. Gould wished to attain something more than this mechanical skill. He was desirous of becoming a scientific naturalist. He possessed a few books on zoology, among which was Bewick's 'British Birds,' a special favourite; these he studied carefully, and when at length his reputation procured him an engagement with the Zoological Society of London to prepare specimens for the museum of that society, he had many opportunities of increasing his knowledge, of which he zealously availed himself. A fine collection of specimens of birds from India had reached England, and in 1830 Mr. Gould was induced to undertake the publication of 'A Century of Birds from the Himalaya Mountains,' of which he furnished the descriptions, and of which his wife (whom he married after settling in London) was the accomplished artist. It was a most magnificent work, the figures beautifully and accurately coloured, in imperial folio, and the price was fourteen guineas. The work was, as it deserved to be, highly successful, and placed Mr. Gould at once amongst the best naturalists of his age.

This success encouraged him to proceed. In 1832 he commenced the publication in parts of his 'Birds of Europe,' and it was completed in 1837. The price of the twenty-two parts was 76l. 8s.; but though so costly, not a copy was ultimately left unsold. All the drawings for these were made upon the stone by his wife. He next published a 'Monograph of the Ramphastidæ,' then a 'Monograph of the Trogonidæ.' In the spring of 1838 Mr. Gould and his wife proceeded to Australia to prepare materials for his next great undertaking, the 'Birds of Australia.' He was absent for two years, during which period "an immense mass of drawings, both ornithological and botanical, were made by the inimitable hand and pencil" of Mrs. Gould, says her sorrowing husband in his preface, for she died within a twelvemonth of their return from Australia. In 1848 the work was completed, forming seven folio volumes, in which he has figured and described 600 species (twice as many as had been before known) from actual observation in their native haunts. He subsequently issued a 'Monograph of the Trochilidæ, or Humming-Birds,' of which he had formed an unrivalled collection. This collection had been long a favourite object, and had been pursued with ardour and perseverance. Specimens were purchased singly or in small numbers at low or high prices, they were transmitted from abroad in letters or in packing-cases, till they amounted to 2000 specimens, illustrating 320 species, a large increase on what had been previously described. In 1851 these specimens were exhibited in the gardens of the Zoological Society in the Regent's Park, and they were afterwards removed to the Crystal Palace at Sydenham. In addition to the works already named, Mr. Gould has published 'Icones Avium,' a 'Monograph of the Macropodidæ,' and a 'Monograph of the Odontophorinæ.'

GOWER, JOHN, an early English writer, was born in the first half of the 14th century. Whether he was older or younger than Chaucer is doubtful; certain it is that they were friends, probably from their college days. The profession which Gower followed is as uncertain as his birth-year. It appears that he studied law, but the story of his having been some time chief-justice of the Common Pleas wants proof. He was attached to the Duke of Gloucester, Richard II.'s uncle, and appears, like Chaucer, to have taken part in censuring the vices and follies of the ecclesiastics of those times. In the latter part of Gower's life it seems nearly certain that a coolness existed between him and Chaucer, and Tyrwhit thinks he has discovered some trace of it in certain expressions of Chaucer, and in the fact that in the second edition of his poems Gower omitted some verses in praise of his friend. As however this second edition did not appear till after the accession of Henry IV., it is probable that Chaucer, who only survived that event about a year, never felt the blow thus aimed against him.

Gower's works are—1. 'Speculum Meditantis,' a collection in French verse of precepts and examples of chastity. 2. 'Vox Clamantis,' a Latin poem, in seven books, on the insurrection of the Commons under Richard II. 3. 'Confessio Amantis,' which is written for the most part in English octave verse, with interspersed Latin elegiacs and Latin prose tables of contents, something like the well-known running commentary to the 'Ancient Mariner.' It consists of eight books and a prologue, and in some parts takes the form of a conversation between the lover and his priest, where story and disquisition are heaped on each other in the most unsparring profusion, with the intention apparently of solacing the lover.

The 'Confessio Amantis' was written towards the end of Gower's life, and appears by its form to have indicated a wish on his part to conform to that taste for English poetry which Chaucer had awakened among his countrymen. As a poet he ranks very far below his friend. His verses are tedious, overlaid with misplaced learning not even poetically introduced; and it seems pretty evident that had Chaucer never lived, Gower would have continued to the end of his days a composer of Norman couplets and Latin elegiacs.

Some smaller poems of Gower's remain in the library of Trinity College, Cambridge, but none of any consequence or merit. The only one of Gower's works which is printed is the 'Confessio Amantis,' which went through four editions before the year 1560. Of his history nothing more is known, except that his principal work (the 'Confessio Amantis') was written in consequence of a casual meeting with Richard II., when that prince asked him to "book some new thing;" that he became blind in his later years, and that at his death he was buried in the church of St. Saviour's, Southwark, where his monument remains. Whatever may be thought of his poems, no one can deny him the praise of having by his benefactions to the above-mentioned building left a monument which no lover of art can pass without admiration. Gower stands half-way between the minstrel of Normandy and the English poet, and he seems to have transferred the faults of a declining literature into the language of one newly arisen.

GOYEN, JAN VAN, a celebrated Dutch painter, born at Leyden in 1596. He studied under several masters, and lastly under E. Vanderweide; and is distinguished for busy canal and river scenes, and occasionally sea-pieces; some of his figures were painted by Jan Steen. His pictures are good in all respects saving colour, in which they are cold, green, and dark—owing no doubt chiefly to the effect of time upon an injudicious choice of colours, or, as some conclude, to the use of Haarlem blue. Van Goyen was certain and rapid in his execution, and once wavered, as related by Hoogstraeten, 'Academie der Schilderkunst,' with two other painters, N. Knipbergen and J. Parcelles, to paint the best picture in a single day: the works of all three were good, but the judges awarded the prize to Parcelles. Van Goyen died at the Hague, according to Houbraken, in 1656. There are a few etchings by him. (Houbraken, *Groote Schouburg*, &c.)

GOZZI, COUNT GASPARO, a writer of some distinction in the Italian literature of the 18th century, was born at Venice, December 4, 1715. He was educated in a college at Murano, but instead of applying himself to the more serious parts of study, he indulged his natural turn for light literature, and works of taste. So great indeed were his indolence and easiness of temper, and his aversion to what looked like business, that notwithstanding his patrimonial property was at first very considerable, he suffered it to go entirely to wreck, leaving himself no other resource than his pen. He had consequently many struggles to encounter, nor were his misfortunes much lightened by his marriage with Luigia Bergalli, a lady of considerable literary attainments, but his senior by ten years, and not altogether so amiable in domestic life as in her poetical effusions. She was however a woman of talent, and besides many original dramas and comedies, she made a translation of Terence in blank verse, and likewise one of Racine; besides which she displayed some proficiency in painting. We may therefore credit his biographers when they tell us that he sincerely regretted her loss, notwithstanding the various vexations she had caused him; and more especially as she had borne him a numerous offspring.

His already shattered fortune had, in the meanwhile, been almost totally dilapidated by his wife's undertaking the management of the theatre San Angelo at Venice; whereby he was reduced to such extremity, that he was compelled to make a subsistence by translating for booksellers, and other literary occupation; and is said not only to have assisted Foscarini in his 'Storia della Letteratura Veneziana,' but to have been the chief author of the work, filling up the outline, which was all that had been furnished by the other. At length, after having toiled with his pen till more than sixty years of age, fortune showed herself all at once more propitious; for on the suppression of the order of Jesuits he was entrusted, in 1774, with drawing up a plan for the new public schools, of which he was appointed prefect, with a handsome salary. Being afterwards commissioned to re-establish the University of Padua, he removed to that city, and there spent the remainder of his days in comparative affluence and leisure, although a great sufferer from many painful attacks and great bodily infirmities. He died December 25, 1786, aged seventy-three, and was buried in the church of S. Antonio at Padua.

Among his original works, which were first published in a collected form by the Abbe Dalmistro, in 1818, in sixteen volumes, the most popular are his 'Sermoni' and the 'Osservatore Veneto,' a series of periodical papers, admirable as well for the elegance of their style, as for their playful well-directed satire, and the sound moral instructions they convey: so that they have obtained for their author the title of the 'Italian Addison.' It has indeed been objected by Ugoni and other critics, that Gozzi was too fond of dressing up his subjects in the form of allegorical narrative, yet many of them display much invention and great ingenuity; and the dialogues after the manner of Lucian, of whom he was a great admirer—such as that between Ulysses and those who have been transformed by Circe into animals—are replete with sententious and satire. He was a no less enthusiastic admirer of Dante than of Lucian, as is proved by his 'Difesa di Dante.' Among various other works translated by him are the 'Daphnis and Chloe' of Longus, the 'Table of Cebes,' Pope's 'Essay on Criticism,' Fleury's 'Ecclesiastical History,' and Marmontel's 'Tales.'

GOZZI, COUNT CARLO, brother to the preceding, was born in March 1772. At a very early age he displayed a taste for literature, and applied himself with such immoderate diligence to reading as to

subject himself to frequent fits of syncope, in the course of which he was at four different times supposed to be actually dead. Equally precocious in his passion for literary composition, before he had well completed his sixteenth year he produced four poems of considerable length ('Il Berlinghieri,' 'Don Chisciotta,' 'La Filosofia Morale,' and 'Gonella,' in twelve cantos), besides a great number of fugitive pieces both in prose and verse, and a translation of Marivaux's 'Pharsamon.' At length, in order to escape from rapidly-increasing family embarrassments occasioned by his father's extravagance and by his brother Gasparo's bad management, he accompanied the Provveditor Querini to Dalmatia, where he continued about three years, and while there he began to apply himself assiduously to the study of mathematics and fortification. On his return to Venice he was for a long time occupied entirely with domestic matters, and in endeavouring to rescue the mortgaged and alienated estates of the family; till, grown weary of constant litigation, he again took up his pen, and in 1761 brought out his first dramatic piece, entitled the 'Three Oranges,' and written for the purpose of supporting the Sacchi company, whose theatre had become almost deserted for that of Goldoni. Its success was so complete that he followed it up with a succession of similar dramas, all founded upon Venetian Fiabé, or stories of wonderful adventures and enchantments, derived from eastern countries, where their scene is uniformly laid. For the Venetian public these pieces had the novel attraction of abundant spectacle, action, and stage bustle, in addition to that of the Maschere of the Italian theatre, and their impromptu dialogue, which Goldoni had endeavoured to banish, and which Gozzi was anxious to revive. They also abound in varied and striking situations, both tragic and comic, and in scenes of Aristophanic humour and licence, in which the author did not at all spare either Goldoni or his other dramatic rival, Chiari. The fame of these romantic tragic and comic pieces soon extended itself to Germany, where the wildness and marvellousness of their plots gained them many admirers; among the rest, of Schiller himself, who has given his countrymen a free translation of that entitled 'Turandotte.' Besides which, a complete German translation of them appeared at Berne, in five volumes, in 1777. In fact, Gozzi has been more liberally commended by foreigners, Ginguené, Schlegel, De Staël, &c., than by Italian critics, some of whom have accused him of being trivial both in his language and his sentiments.

He afterwards composed a number of other dramas, partly translated, partly borrowed from various Spanish authors; also a humorous poem in twelve cantos, entitled 'Marfisa Bizzarra.' Further he has, like his rival Goldoni, given us his autobiography under the whimsical title of 'Memorie Inutili della sua Vita, scritte da lui medesimo, e pubblicate per Umiltà.' This work was never completed by him, but he discontinued it after the part printed in 1798, notwithstanding that he lived several years longer, for his death did not take place till April 6, 1806, when he had attained the age of eighty-four.

GOZZOLI, BENOZZO, a celebrated old Italian painter, born at Florence in 1400, according to Vasari, but in 1406, according to Ciampi. He was the pupil of Fra Giovanni da Fiesole, whose works, as well as those of Masaccio, he studiously imitated, but he failed completely in attaining Masaccio's style of design. Many of Benozzo's frescoes still exist in a tolerable state of preservation, more or less. Those in the Campo-Santo at Pisa are considered the best. He painted here twenty-four pictures, covering one whole side of the building; he commenced in 1469 and finished them in 1485, and was paid for each picture about ten ducats (sixty-six lire); he was to paint by agreement three pictures in a year. Supposing Benozzo's whole time was thus occupied, which it probably would have been if he had painted three pictures every year, we have a great painter fully employed in the middle of the 15th century, for a salary of less than thirty ducats, or about 13*l.* sterling per annum, which however would probably be equivalent to upwards of 300*l.*; a sufficient income, if for the spring and summer months only. Benozzo was however paid at a higher rate at Orvieto, in 1447, when he received seven ducats per month: but this must have been merely during the spring and summer months, when fresco painters can only work.

Benozzo painted also in Florence, at Rome, at Volterra, and at San Gimignano, but he settled and died at Pisa, in what year is not exactly known. Vasari was misled by the inscription on his tomb in the Campo-Santo, which is not the date of Benozzo's death, but the date of the year in which Pisa presented him with the tomb during the progress of the paintings. He probably died in 1485.

(Vasari, *Vite de' Pittori*, &c., and the Notes of Schorn's German Translation; Ciampi, *Notizie inedite della Sagrestia Pistoiese*; Rosini, *Descrizione delle Pitture del Campo Santo di Pisa*; Rumohr, *Italiensche Forschungen*.)

GRABE, JOHN ERNEST, was born at Königsberg, July 10, 1666, and was educated at its university, in which his father Martin Sylvester Grabe was professor of divinity and history. He applied himself diligently to the reading of the fathers, and was led by the perusal of them to question the validity of the ordination of ministers in the Lutheran Church. He therefore resolved to embrace the Roman Catholic faith; but first presented to the ecclesiastical consistory at Sambia in Prussia a memorial containing his doubts and difficulties. Three Lutheran divines were commanded by the elector of Brandenburg to reply to this, but, unable to convince him, they recommended

him to go to England, where he would find a clergy which derived their right to the ministry from apostolical succession. In accordance with their advice he came to England, where he was well received by William III., who settled a pension upon him. He took orders in the Church of England, and was made D.D. by the University of Oxford, April 26, 1706. He died in London, November 13, 1711, in his forty-fifth year, and was interred in Westminster Abbey. Dr. Hickee has given an interesting account of the life of Dr. Grabe, from which we learn that he was in favour of prayer for the souls of the dead who died in faith, for anointing the sick with oil, for confession and sacerdotal absolution, and that he used to lament that the Reformed churches had discarded many primitive customs which were retained in the Roman Catholic Church.

Dr. Grabe published many works, of which the most celebrated is his edition of the Septuagint, printed at Oxford in 4 vols. fol. and 8 vols. 8vo., 1707-1720. The text of this edition was founded upon the Alexandrian manuscript now in the British Museum. He only lived to superintend the publication of the first and fourth volumes; the second and third, published after his death, were edited respectively by Dr. Lee and Mr. Wigan. Among his other works, the principal are, 'Spicilegium SS. Patrum,' 2 vols. 8vo. Oxf. 1698-9; 'Justini Apologia Prima,' 8vo. Oxf. 1700; 'Irenæi adversus Hæreses Libri V.' fol. Oxf. 1702; 'Epistola ad Millium,' 4to. Oxf. 1705, to show that the Alexandrian manuscript of the Septuagint contains the best version of the Book of Judges, and that the version in the Vatican manuscript is almost a new one, made in the third century; 'An Essay upon two Arabic manuscripts of the Bodleian Library, and the book called the Doctrine of the Apostles,' 8vo. Oxf. 1711; 'De Forma Consecrationis Eucharistiæ, hoc est, Defensio Ecclesiæ Græcæ contra Romanam,' 8vo. Lond. 1721.

GRACCHUS, TIBERIUS, was born B.C. 163, and was the son of Tiberius Sempronius Gracchus, a man of some celebrity in the annals his country, and of Cornelia, daughter of Scipio Africanus.

T. Gracchus the elder died while his sons were yet young; having twice served the office of consul, and, according to Plutarch, obtained two triumphs. Two anecdotes remain regarding him which seem to exhibit him as a Roman of the old class, affectionate, high-spirited, and religious. After the death of her husband, Cornelia refused all offers of marriage, and devoted herself to the charge and education of her children, who, as Plutarch tells us, were less the inheritors of manly virtue by being sprung from the noblest blood in Rome, than they were its possessors from the careful nurture of their mother Cornelia.

Tiberius served his first campaign in Africa under his uncle Scipio, and having obtained the office of consul's questor, we find him next under Mancinus, the unfortunate commander in the Numantine war. His name, which the Numantines respected from remembering his father's virtues, is said to have procured the terms under which Mancinus obtained safety for his army; but the senate on his return was so much displeased at the unfavourable nature of the terms, that they resolved on giving up all the principal officers to the Numantines. By the good-will however of the popular assembly, influenced, as it should seem, by the soldiers and their connections in the lower classes, it was decided to send Mancinus as the real criminal, and to spare the other officers for the sake of Gracchus: treatment of this nature was likely to rouse Gracchus against the senate, and make him the friend of the poor, and accordingly in three years afterwards we find him beginning his short career as a political agitator. He was elected tribune of the Plebs, B.C. 133.

The long wars in which the Romans had been engaged led to the introduction of an enormous number of slaves into Italy. These slaves had taken the place of the regular inhabitants of the country, and tilled the large estates of the rich to the exclusion of the regular labourers. In Sicily they mustered so strong as to maintain themselves upwards of two years against their masters, backed by the power of Rome; and in Italy itself the scene which presented itself to T. Gracchus as he returned from Spain was that of a whole country whose only cultivators were foreign slaves. Nor did he find less cause for complaint in the city, crowded as it appears to have been with needy soldiers, whose services had found no remuneration adequate to their expectations.

These causes, acting on a disposition at once ambitious and humane, and aided by the suggestions of a mother, who could not help reminding her sons that she was still called, not 'mother of the Gracchi,' but 'daughter of Scipio,' and by the general voice of the people expressed in placards and memorials addressed to him as to their preserver and champion, combined in inducing Tiberius Gracchus to attempt the revival of the Licinian Rogations. In so doing he appears to have had in view the two grand principles which that law involved, namely, the employment of freemen in preference to slaves, and the more generally recognised principle of the equitable division of the public land.

Three commissioners were to be appointed to superintend the working of the new law, which Gracchus proposed, if we may trust Plutarch, with the approval of several of the most eminent persons of the time, among whom were Mutius Scaevola and Crassus.

Such general interest was excited by the question, that crowds arrived from all parts of the country to support either side; and there appeared no doubt which way the matter would go when left to

the tribes. The aristocracy however secured the veto of M. Octavius, one of the tribunes, and thereby quashed the proceedings whenever the law was brought on, which violent mode of opposition led Gracchus to exercise his veto on other questions, stop the supplies, and throw the government into the most complete helplessness.

Thus far the contest had been lawful, but at this juncture Gracchus, irritated by continued opposition, invited Octavius to propose his (Gracchus's) ejection from the office of tribune, and on his refusal, pleading the utter uselessness of two men so different holding the same office, he put the question to the tribes, that Octavius be ejected. When the first seventeen out of the thirty-five tribes had voted for it, Gracchus again implored him to resign, and on his entreaty proving unsuccessful, polled another tribe, constituting a majority, and sent his officers to drag Octavius down from the tribune's chair. The Agrarian law was forthwith passed, and Gracchus himself, his brother Caius, and his father-in-law Appius Claudius, were appointed the commissioners; but the senate, to show their opinion of the whole proceeding, withheld from him the usual allowance of a public officer, giving him only about one shilling a day. While things were in this state, Attalus, king of Pergamus, bequeathed his dominions and treasure to the Roman people; and to enhance his own popularity, Gracchus proposed to divide the treasure among the recipients of land under the new law, to enable them to stock their farms, and to commit the management of the kingdom of Pergamus to the popular assembly.

This brought matters to a greater pitch of distrust than ever. Gracchus was accused by one senator of aspiring to tyranny, and by another of having violated the sanctity of the tribune's office in deposing Octavius. On this point Gracchus strove to justify himself before the people, but his opponent seems to have gained an advantage so great as to induce him to postpone the assembly. When at last he did make his defence, it rested, if Plutarch is correct, on false analogies, and on blinking the question of the inviolability of a public officer.

At this juncture Gracchus seems to have trembled for that popularity which alone preserved him from impeachment; and, lest it should fail, endeavoured to secure his own re-election to the office of tribune. The other party had demurred as to his eligibility to the office two years in succession, and on the day of election this point occupied the assembly till nightfall. Next morning, accompanied by a crowd of partisans, he went to the capitol; and on hearing that the senate had determined to oppose him by force, armed his followers with staves, and prepared to clear the capitol. At this juncture, Scipio Nasica, having in vain called on the consul to take measures for the safety of the state, issued from the Temple of Faith, where the senate had assembled, followed by the whole nobility of Rome, awed the mob into flight, seized their weapons, and attacked all who fell in their way. About three hundred fell, and among the slain was Gracchus, who was killed by repeated blows on the head, B.C. 133.

GRACCHUS, CAIUS, was nine years younger than Tiberius Gracchus, at whose death he was left with Appius Claudius as commissioner for carrying out the Agrarian law. By the death of Appius, and of Tiberius's successor, Licinius Crassus, the commission was composed of Fulvius Flaccus, Papirius Carbo, and himself; but he refrained from taking any part in public affairs for more than ten years after that event.

During this time the provisions of his brother's law were being carried out by Carbo and Flaccus, but he does not seem to have begun his career as an independent political leader until the year B.C. 123, when, on his return from Sardinia, where he had been for two years, he was elected tribune of the Plebs. His first act was to propose two laws, one of which, directed against the degraded tribune Octavius, disqualified all who had been thus degraded from holding any magistracy; and the other, having in view Popilius, a prominent opponent of the popular party, denounced the banishment of a Roman citizen without trial. The first was never carried through; to the latter was added a third, by which Popilius was banished Italy (forbidden fire and water). These measures of offence were followed by others, by which he aimed at establishing his own popularity. One of these was a poor-law, by which a monthly distribution of corn was made to the people at an almost nominal price. The effect of this law was to make the population of Rome paupers, and to attract all Italy to partake of the bounty.

Next came organic changes, as they would now be called; and of these the most important was the transference of the judicial power from the senators, wholly or in part, to the equestrian order. This measure, according to Cicero, worked well; but in taking his opinion we must remember his partiality to the 'equites,' and add to this the fact that his eulogium occurs in an advocate's speech. ('In Verrem,' actio i.)

Gracchus now possessed unlimited power with the populace; and at the end of the year, not more than ten candidates having started for the office of tribune, he was again chosen. His second tribuneship was mostly employed in passing laws respecting the colonies, in which matter the aristocratical agent, Livius Drusus, outbid him; and having won the confidence of the people by his apparent disinterestedness, ventured (being himself a tribune) to interpose his veto on one of Gracchus's measures. His appointment soon after to the office of commissioner for planting a colony near Carthage took him away from the scenes of his popularity, and soon after his return a proposal was made to repeal the very law which he had been engaged in carrying

out. This law was not his own measure, but that of one Rubrius, another of the tribunes, and was one of those enactments which had won the favour of the people from him. He was now a private man, as his second tribuneship had expired, but as such he opposed the proposal, and united with Fulvius, one of the commissioners of the Agrarian law, to incite the populace to acts of open violence.

His partisans collected at the capitol on the day of deliberation, and by their outrageous conduct broke up the assembly. The senate, alarmed at these proceedings, gave the consul Opimius full powers, according to the usual form, "to take care that the state took no harm." He collected soldiers, and summoned Gracchus and Fulvius to answer the charge of murder. After some attempt at negotiation he attacked the popular party, and soon dispersed them. Gracchus had been too good a citizen to abet in the resistance which his followers attempted, and fled. Being hard pressed he crossed the Tiber, and there, in a Grove of the Furiæ, commanded his servant to destroy him. He perished when about thirty-three years of age, B.C. 121.

The character of Caius is not nearly so stainless as his brother; he was more of a popular leader, and much less of a patriot, than Tiberius; the one was injured by power, but the other seems from the beginning to have aimed at little else. The elder brother was head of a party which owed its life to his principles as a politician. The younger took the lead in that party when it had been regularly formed, and in his eagerness to obtain that post regulated his conduct by its wishes. The death of Tiberius may be justly called a murder; that of Caius, or that which he would have suffered had not the slave prevented it, was nothing more than an execution under martial law.

GRÆVIUS, JOHN GEORGE, was born in 1632, at Naumburg in Saxony, and studied at Deventer under J. F. Gronovius, whom he succeeded some years after as professor of history and eloquence. He was afterwards appointed to fill the same situation at Utrecht, where he continued for above forty years, to the time of his death in January 1703. He acquired the reputation of one of the first classical scholars of his age, a reputation which he supported by the numerous editions of ancient classical writers which he published and enriched with his own notes, such as Catullus, Tibullus, and Propertius, Cæsar's 'Commentaries,' the 'Epistles' and 'Offices' of Cicero, Suetonius, Lucian, Hesiod, and Callimachus; besides editions of modern works on classical literature, such as Meursius, 'De Regno Laconico, de Piræo, de Cypro, Rhodo, et Creta, &c.' He also published 'Inscriptiones Antiquæ totius Orbis Romani in absolutissimum corpus redactæ.' But the greatest work of Grævius is his 'Thesaurus Antiquitatum Romanarum,' 12 vols. fol., Leyden, 1694-99, in which he has collected the best writers who have illustrated the institutions and laws, the customs, the manners, and the arts of the ancient Romans. He afterwards prepared, as a sequel to it, an enormous collection under the title of 'Thesaurus Antiquitatum et Historiarum Italiae, Neapolis, Siciliae, Sardiniae, Corsicæ, aliarumque Insularum adjacentium,' which was published after his death by Peter Burmann, with additions, in 45 vols. fol., Leyden, 1704-25. Grævius published also a collection of rare and choice treatises, by various writers, on curious subjects connected with ancient history, such as T. Reinesius, 'De Lingua Punica,' and 'De Deo Endovellico,' by the same; C. Daumius, 'De Causis Amissarum Latine Lingue Radicum;' C. F. Frankenstein, 'De Ætario Populi Romani,' &c. This collection is entitled 'Syntagma Variarum Dissertationum,' 4to, Utrecht, 1702. T. A. Fabricius published a collection of Latin letters and orations of Grævius, with his Éloge, by P. Burmann.

GRAFTON, RICHARD, a printer in London, in the middle of the 16th century, under whose name are several works relating to the history of England, but they are not of much if any value. They include a small Chronicle, in 16mo, which was often reprinted between 1563 (when it first appeared) and 1572; a still smaller, in 24mo, 1565; and his great chronicle entitled 'A Chronicle at large, and meere History of the Affaires of Englande and Kinges of the same,' 2 vols. folio, 1569. The appearance of the chronicles of Holinshed and Stowe threw Grafton's into the shade.

GRAHAM, JAMES. [MONTROSE.]

GRAHAM, RIGHT HON. SIR JAMES ROBERT GEORGE, BART., M.P., was born in Cumberland in June 1792. He is the eldest son of Thomas Graham, Esq., of Netherby, who was created a baronet in 1782, and married the eldest daughter of the seventh earl of Galloway. The present Sir James Graham was educated at Westminster, and at Queen's College, Cambridge. At an early age he gave evidence of that great administrative and business capacity which is his chief characteristic. As private secretary to Lord Montgomerie, in Sicily, the entire duties of the mission for some time devolved on him, consequent on the illness of the chief. He continued the service under Lord William Bentinck, and, in some military capacity, negotiated the armistice with Murat at Naples. In 1818 he successfully contested Hull, on ultra-liberal principles; but his father's views were so very different, that his election expenses, 13,000*l.*, were defrayed by others. He did not long retain his seat, where however he had made himself notorious for power of sarcasm and attack. In pamphlets of this and a later period he attacked the Corn Laws, and also advocated some views respecting peasants and May-poles, not unlike those subsequently known as the opinions of the Young England party. He succeeded to his father's baronetcy in 1823, having married in 1819

the daughter of Sir James Campbell of Ardinglass. In the general election of 1826 he was returned on the same principles as before for Carlisle, and in 1830 accepted office under Earl Grey as First Lord of the Admiralty. Here he practised those doctrines of economy which he had always held. He effected many improvements, and doubtless saved large sums of the public money; but the wisdom of naval parsimony has recently been tested and found wanting; and moreover Sir James introduced some variations in ship-building which have proved complete failures. In 1831 he was appointed one of the committee of four to consider Earl Grey's promised Reform measure; and it was on the report which he assisted to frame that the bill ultimately passed was formed. In 1834, Sir James Graham and Mr. Stanley (now Lord Derby) resigned, disagreeing with their colleagues on the Appropriation Clause in the Irish Church Temporalities Bill, by which some saving consequent on a proposed new method of letting Church lands was to be devoted to purposes not precisely clerical. This they denounced as confiscation. Lord Grey's cabinet went out on the point; but Sir James would not join the short-lived administration of Sir Robert Peel, remaining of no party until 1841, when, on the accession to more permanent power of Sir Robert Peel, he became Home Secretary. Under this government he took an active part in the establishment of the New Tariff and the Income-tax, of the Factory Act, and the Bank Charter Act. In 1844 he became extremely unpopular, in consequence of ordering letters addressed to M. Mazzini to be opened and copied at the General Post-Office. Sir James was next better occupied in the repeal of the Corn Laws, when he took an active and prominent part in those fierce conflicts, in which the weight of Lord George Bentinck and the dazzle of Mr. Disraeli were opposed to the calmer yet unflinching determination of himself and Sir Robert Peel. Shortly afterwards the government went out on the Irish Coercion Bill, through the agency of the defeated Conservative party, which sided with the Whigs and the Irish in a spirit of vengeance for the loss of Protection. But the Peelites, as they were now called, did not go into opposition; on the contrary, they supported Lord John Russell's government in most measures which have since received the approval of the country—the Sugar Duties Reduction, the Navigation Laws, &c. But on the Greek question, Sir Robert Peel and his former colleagues, Sir J. Graham, Mr. Gladstone, and Mr. Sidney Herbert, spoke (Sir Robert for the last time in that house) most powerfully against the policy of Lord Palmerston. Pursuing his principles of perfect religious liberty, Sir James Graham refused to act with Lord John Russell, on the re-formation of his cabinet in 1851, because of the alleged intolerance of Lord John's Ecclesiastical Titles Bill, which however was carried again by the support of Mr. Disraeli's country party. After the ten months' administration of Lord Derby, Sir James Graham returned to his old post at the Admiralty, under the coalition government of Lord Aberdeen in 1853. He retained office until the close of 1854, and again for a few days under Lord Palmerston, at the commencement of 1855, when he resigned, as it appeared, after assisting to carry on the war with Russia against his own idea of its justice. His former parsimony and reforms at the Admiralty had now borne fruit. Admiral Sir Charles Napier, who had the command of the Baltic fleet, laid his inactivity to the charge of Sir James, alleging that he had been supplied with vessels of an improper description, which would have been useless even had they been efficiently manned; and that he had been crippled by conflicting and ignorant orders. Subsequently, from his place in parliament as member for Southwark, Sir Charles brought forward charges against Sir James, which failed to arrest more than the passing attention of the house, when the affair had assumed the colour of a private quarrel.

Sir James Graham has always been recognised as most able in office. He has perhaps as great a faculty for hard work and clear precision of administration as can be found. In his long parliamentary career he has successively represented Hull, Carlisle, East Cumberland, Pembroke, Dorchester, Ripon, and finally Carlisle again, being returned for the last-named place at the general election of 1852.

GRAHAM, JOHN, VISCOUNT DUNDEE, commonly called CLAVENHOUSE, from the name of an estate belonging to his father Sir William Graham, of whom he was the second son, was probably born about the year 1649 or 1650. He is said to have studied at St. Andrews, and to have made some proficiency in the mathematics; but learning was not a sphere in which he shone; and Sir Walter Scott, who endeavoured to raise his character from that of the ordinary soldier of fortune, and to endow him with a higher tone of feeling, cannot help comparing his letters to those of a chambermaid. Many of the younger sons of the Scottish gentry—poor, intrepid, and accustomed to that superiority over their neighbours which suits a man at once for command in a half-disciplined army—had by these qualities held commissions during the Thirty Years' War, without being very fastidious about the side on which they fought. Graham was evidently brought up to this trade. He entered first the French and then the Dutch service, obtaining in the latter considerable distinction. Being however refused the command of a regiment, he returned to Scotland in 1677. He obtained a captain's commission in one of the troops of horse employed in enforcing obedience to the penal laws against nonconformists in Scotland. Among many cruel instruments, he became conspicuous by his barbarity, and obtained an unenviable renown in history, romance, and local tradition. A considerable body of Covenanters having

announced that they were to hold a solemn preaching on the 1st of June 1679, Graham, on his way to disperse them, was met by an advanced body of these enthusiasts, armed and well commanded, who, in a piece of ground called Drumclog, dispersed his troopers, and compelled him to fly for his life. At the subsequent battle of Bothwell Bridge his exterminating counsels were fortunately counteracted by the milder genius of Monmouth, the commander of the expedition. In 1688 he was raised to the peerage by the title of Viscount Dundee and Lord Graham of Claverhouse. While the Convention Parliament was sitting in Scotland arranging the Revolution settlement, he put himself at the head of some Highland and Irish marauders, with whom, on the 17th of June 1689, he successfully defended the pass of Killierankie against Mackay until he was killed by a random shot.

GRAHAM, MARIA. [CALCOTT, LADY.]

GRAHAM, ROBERT, the third son of Dr. Robert Graham, afterwards Moir of Leckie, was born at Stirling on the 3rd of December 1786. He followed his father's profession, and in the early part of his life practised medicine at Glasgow. Previous to the year 1818 there was no separate chair of botany in the University of Glasgow, and lectures on this subject were read by the professor of anatomy in the summer season. On the government establishing a separate chair for botany, Dr. Graham was appointed to the post. In 1821 the chair of botany becoming vacant in the University of Edinburgh, Dr. Graham was the successful candidate for the office. He was also appointed physician to the Infirmary, and conservator of the Botanic Garden of Edinburgh, to which he speedily devoted much attention, and to his exertions the garden is mainly indebted for its present flourishing condition.

Although Dr. Graham evidently possessed but little botanical knowledge on his being appointed to the Glasgow chair, he devoted himself with great enthusiasm to the study of it in Edinburgh, and he probably enlisted the feelings of his pupils more by his enthusiasm than his deep knowledge. One plan which he adopted was very successful in producing a love of the science he taught, and that was his practice of making excursions with his pupils to some distant part of the country. He thus examined, during successive summers, the floras of several important districts of Scotland, England, Wales, and Ireland. The knowledge which he thus obtained, induced him to prepare materials for a Flora of Great Britain, which however he did not live to publish. His published works consist chiefly of descriptions of new or rare plants which flowered in the botanic gardens of Edinburgh. These, as well as notices of his excursions and other papers, appeared in the 'Edinburgh New Philosophical Magazine,' Curtiss's 'Botanical Magazine,' and Hooker's 'Companion to the Botanical Magazine.'

Dr. Graham was a strong and powerful man, but his health gave way some years before his death, and he eventually died on the 7th of August 1845, of an encephaloid tumour which occupied the back part of the thorax and pressed upon the great vessels of the heart. He was a frank kind-hearted man, and few men have left behind them a larger circle of affectionate friends to lament his death.

GRAINGER, JAMES, was born at Dunse about the year 1728. Having been educated for a surgeon, he served in the army in that capacity, first during the rebellion of 1745, and afterwards in Germany. Having resigned his commission, he practised for a short time in London, and then accepted a situation at St. Christopher's. On his arrival there, he married the daughter of a lady whom he had cured of small-pox during the voyage. He continued, with a short exception, to reside at St. Christopher's until his death, which took place Dec. 24, 1787.

His only claims to celebrity rest on his 'Ode to Solitude,' and his poem entitled the 'Sugar-Cane.' Of the first we can only say that it contains sundry false quantities, much nonsense, and a few good lines; and of the second, that it is one of those numerous instances afforded, wherever we turn in the literature of the last century, which evince that the principles of poetry had been utterly lost sight of by a large proportion of those who called themselves, and whom others called, poets. Virgil has shown what difficulties didactic poetry presents; but when a man of but moderate powers of versification, and very little taste, sits down to write a treatise on sugar plantations, and thinks it an improvement on 'rats' to call them 'the whiskered vermin race,' little indeed of true poetical imagery can we expect to find amongst his descriptions. The absurdity of hanging classical trappings round a subject like our author's is too evident to need notice, and perhaps the poem is too much forgotten to make it worth while to censure its principles; but we cannot dismiss the subject without remarking that Grainger shows himself to have been almost entirely callous to the barbarities practised on the slaves.

GRAINGER, RICHARD, to whose enterprise and skill the town of Newcastle-upon-Tyne owes great improvements in its street communications and its architectural character, was born at Newcastle in 1798, and was the third child of parents in a very humble position. His father was a porter employed on the quay; and his mother, a native of Gibraltar, after her husband's death, supported her children by stocking-grafting, glove-making, and clear-starching. Richard Grainger's school education was such as could be got at the charity-school of the parish. He was apprenticed to a house carpenter and builder. Even when he was only twelve years of age, the

erection of a covered market in place of the shambles, which had been till then in the open street, seems to have impressed itself upon his mind as an improvement of an important description; and he was shortly afterwards led to notice the inconvenient arrangement of the centre of the town, where a space of twelve acres was unoccupied by streets, and the communications were circuitous. He also noticed that the quarries of the neighbourhood were turned to little account. During the period of his apprenticeship he was entrusted with the collection of money for a Tract Society attached to the Methodist body to which he belonged, when many indications of his future character were observed. When he was out of his time, his elder brother, a bricklayer, engaged him to join in the rebuilding of a small house in High Friar Chase. Afterwards, on the illness of his brother, Richard Grainger commenced for himself, when he was employed to build some of the houses of Higham Place. Soon afterwards he married; and his wife not only brought him 5000*l.*, but assistance in the management of his accounts and correspondence. He then pursued several undertakings of an extensive nature with commercial success; and in his buildings, by the use of stone, and the adoption of improved decorative details, he added somewhat to the architectural appearance of the town. Amongst such undertakings may be named Eldon Square, the Leazes Terrace and Crescent, north of the town, and the Royal Arcade, containing some of the principal public and private offices. Eldon Square was commenced in 1826, and after that speculation Grainger had realised 20,000*l.* The Arcade was commenced in 1831, and opened in less than a year. It cost 40,000*l.* Mr. Grainger next purchased the twelve acres of ground before referred to, and other old property, besides the Butcher-market erected twenty-four years before, and the Theatre, and thereupon commenced and completed in the short space of five years, or from August 1834 to August 1839, what are probably the most important and successful improvements that have ever been effected in such a period of time in any town. The improvements included nine new streets—amounting to a length collectively of one mile, two hundred and eighty-nine yards,—also the new market, the exchange, the new theatre, a new dispensary, a music-hall, a lecture-room, two chapels, incorporated companies' hall, two auction marts, ten inns, twelve public-houses, forty private houses, and three hundred and twenty-five houses with shops. These works were estimated to have added nearly 1,000,000*l.* to the value of the place. The new market was commenced in 1834, and opened October 24th, 1835. It exceeds in size the great market at Liverpool. Of the new streets Grey Street and Grainger Street are the principal. They meet at an angle,—the column, with the statue of Earl Grey, terminating the vista of each street. The Central Exchange occupies the interior of the triangular block of buildings at the junction. The theatre, by Mr. Benjamin Green, architect, with a Corinthian portico, is in Grey Street.

Mr. Grainger's works at Newcastle undoubtedly contribute to the architectural character of the town, as much as they do to its internal convenience. For the attainment of effect in architecture, the study of ground plan is essential, and it happens that in the arrangement of streets and the disposition of masses of building, art and convenience go even more than usually hand in hand. To the extent here referred to, the works of Richard Grainger have shown a feeling for art which it is surprising could be manifested without any architectural education, and amidst the pressure of commercial undertakings. Study of detail however, along with the grouping of masses, is necessary to full architectural effect; and here there may be much in the buildings of Newcastle that should detract from the praise they have received. As street improvements Mr. Grainger's works merit eulogium; but viewing the buildings themselves, it cannot be said that they are much in advance of the architecture of their time, or equal to what has been done in the chief commercial towns of England subsequently. As in the case of Regent Street, the combination of a fragile-looking substructure with a ponderous superstructure is fatal to everything else. In the designs of his buildings, Mr. Grainger has doubtless had much assistance, without however lessening the surprise which may be felt at such architectural knowledge as he has exhibited. Those only who know the nature of such vast undertakings as his have been, will be able to award him the due credit for his industry and mental power.

GRAMMONT, or GRAMONT, COUNT, a celebrated personage of the age of Louis XIV., served in the army with great distinction, and rose to the rank of lieutenant-general, but he acquired his celebrity by his great wit and his relations with the most eminent persons of his day. He spent some time at the court of Charles II. of England. During his residence in England he engaged to marry Miss Hamilton. Forgetting or neglecting his promise, he set out to return to France; but being joined by two of the lady's brothers at Dover, and asked whether he had not forgotten something, "Yes, indeed, I have forgotten to marry your sister," answered Grammont, and immediately returned to complete his engagement. Grammont died in 1707, aged eighty-four. His memoirs, which were published by his brother-in-law, Anthony Hamilton, are admitted to be the cleverest production of that kind; they abound in wit and animation, and present a lively, although, in their astounding licentiousness, a sometimes disgusting picture of the profligate court of Charles II. They have gone through many editions in Paris as well as in London. Of the following edition

only 100 copies were printed:—*Mémoires du Comte de Grammont, nouvelle édition augmentée des notes et éclaircissements nécessaires, par M. Horace Walpole*, Strawberry Hill, 1772, in quarto, with three portraits. Of the English editions perhaps the best is that of 1811, in 2 vols., with sixty-three portraits, and many notes and illustrations, some of which are ascribed to Sir W. Scott; but this edition has been reprinted, with all the notes, in a single volume, published as one of Bohn's series of 'extra volumes.'

GRANBY, MARQUIS OF. JOHN MANNERS, commonly called Marquis of Granby, eldest son of John, third Duke of Rutland, was born January 2, 1720-21. Having entered the army, he raised a regiment of foot at his own expense in the rebellion of 1745; was appointed Colonel of the Horse Guards (Blues) in 1758; raised to the rank of lieutenant-general in 1759; and sent in the same year as second in command, under Lord George Sackville, of the British troops co-operating with the king of Prussia. Being present at the battle of Minden, he received the thanks of Prince Ferdinand of Brunswick in the following terms:—"His serene highness further orders it to be declared to Lieutenant-General the Marquis of Granby, that he is persuaded that if he had had the good fortune to have had him at the head of the cavalry of the right wing, his presence would have greatly contributed to make the decision of that day more complete and brilliant." This however is not so much a compliment to the marquis as a reflection on his superior, who, as is well known, was accused of reluctance and dilatoriness in obeying orders to bring forward the British cavalry, and was ultimately broken for his conduct on this occasion. On Lord G. Sackville's resignation, the marquis was appointed to the chief command of the British troops, which he retained during the rest of the Seven Years' War, and both they and he gained honour at the battles of Warburg (1760), of Kirch-denker (1761), and of Gräbenstein and Homburg in 1762. After four years of warm service, he was rewarded with the post of Master of the Ordnance in May 1763, and in August 1766 was promoted to be commander-in-chief. He resigned this office in January 1770, and died much regretted on the 19th of October following, without succeeding to the dukedom. He appears to have been a good soldier; brave, active, generous, careful of his men, and beloved by them; a valuable second in command, but not possessed of the qualities which make a great general. His popularity was shown by the frequent occurrence of his portrait as a sign for public-houses.

GRANDVILLE. [GERARD, JEAN-IGNACE-ISIDORE.]

GRANGER, REV. JAMES. So little is known of the personal history of Granger, that even the date of his birth appears to be unrecorded. He studied at Christchurch, Oxford, and was presented to the vicarage of Shiplake, in Oxfordshire, where, according to the dedication of the work which brought him into notice, he had "the good fortune to retire early to independence, obscurity, and content." This work, which must have occupied many years of preparatory labour, is entitled 'A Biographical History of England, from Egbert the Great to the Revolution; consisting of characters disposed in different classes, and adapted to a methodical Catalogue of engraved British Heads; intended as an Essay towards reducing our Biography to system, and a help to the knowledge of Portraits.' The first edition appeared in 1769, in 2 quarto vols., each forming two parts, so that it is often described as in four volumes. Some copies of this edition were printed upon one side of the paper only, to leave room for manuscript notes, or for the insertion of illustrations. In 1774 appeared, in the same size, a 'Supplement' of corrections and additions, in one volume, which was incorporated in the second edition of the whole work, in 4 vols., 8vo, in 1775. A fifth edition, with upwards of 4000 additional lives, appeared in 1824, in 6 thin royal octavo vols. Granger made considerable progress in the preparation of a continuation of the work, and there are extensive manuscript collections in the British Museum, which were formed by his friend Sir William Musgrave to assist him in this object, but he did not live to complete it; and the continuation, which extends only to the end of the reign of George I., and was compiled by the Rev. Mark Noble, partly from his own and partly from Granger's collections, did not appear until 1816. It is in three volumes octavo. Granger's work certainly contains much curious matter, and has been useful in promoting a taste for British biography; but, as it was designed rather as an illustration of British portraits, than as an account of British worthies, we find him, as Chalmers observes, "preserving the memory of many of the most worthless and insignificant of mankind, as well as giving a value to specimens of the art of engraving which are beneath all contempt." So great an impulse was given to the taste for collecting portraits by the publication of this work, that in many cases it was pursued with an ardour truly ridiculous, and the most preposterous prices being given for engravings of little intrinsic value or genuine historical interest. Granger, who published nothing else except a few single sermons and tracts, died on the 14th of April 1776, at the age, it is supposed, of about sixty. An octavo volume, containing extracts from his correspondence with several literary contemporaries relative to his work, and miscellanies and notes of tours in France, Holland, and Spain, edited by J. P. Malcolm, appeared in 1805.

GRANT, ANNE, commonly called Mrs. Grant of Laggan, a miscellaneous writer, was born at Glasgow on the 21st of February 1765.

Her father Duncan Macvicar held a commission in the army, and served for some time in America before the Revolution. He possessed considerable estates in Vermont, which on the breaking out of the war were appropriated by the revolutionists, while he did not come within the scheme of compensation to sufferers, as he resided in Britain during the war. In 1773 he became barrack-master of Fort Augustus in Inverness-shire, and there his daughter met Mr. Grant, the clergyman of the neighbouring parish of Laggan, to whom she was married in 1779.

Mrs. Grant was left a widow in 1801, with a large family, and in very straitened circumstances. She had for some time shown a taste and talent for poetry, and in 1803 her friends prevailed on her to publish a volume of 'Original Poems with some Translations from the Gaelic,' which was very successful. From her first residence in the Highlands she had studied the position and habits of the people, and written a series of letters on the subject to her intimate friends, from 1778 downwards. She was now prevailed on to collect these letters, and they were published in 1806 under the title of 'Letters from the Mountains,' one of the most successful of the productions of light literature in its day. She subsequently lived at Edinburgh, where she was the highly esteemed centre of a circle of accomplished and amiable people. Through a long train of domestic calamities, accompanied by bodily infirmities, she preserved an equal serenity of temper, her company was sought by the best Scottish society, and she was even enabled, while carrying on a long war with pecuniary difficulties, to be generous to others. Besides the above works she published 'Memoirs of an American Lady,' in 1808; and 'Essays on the Superstitions of the Highlands of Scotland,' in 1811. She died on the 7th of November 1838.

(*Memoir and Correspondence of Mrs. Grant of Laggan, by her Son, 3 vols. 1844.*)

* **GRANT, FRANCIS, R.A.,** the fashionable portrait painter, is a younger son of Francis Grant, the laird of Kilgraston, and was born about the beginning of the present century. Sir Walter Scott, who took a warm interest in young Grant, has left in his Diary (March 26, 1831) the following account of him:—"In youth he was passionately fond of fox-hunting and other sports; he had also a strong passion for painting, and made a little collection. As he had sense enough to feel that a younger brother's fortune would not last long under the expenses of a good stud and a rare collection of chefs d'œuvre, he used to avow his intention to spend his patrimony, about £10,000, and then again to make his fortune by the law. The first he soon accomplished. But the law is not a profession so easily acquired, nor did Frank's talent lie in that direction. His passion for painting turned out better. . . . In the meantime Frank saw the necessity of doing something to keep himself independent, having too much spirit to become a 'Jock the laird's brither,' drinking out the last glass of the bottle, riding the horses which the laird wishes to sell, and drawing sketches to amuse the lady and the children. He was above all this, and honourably resolved to cultivate his taste for painting, and become a professional artist. I am no judge of painting, but I am conscious that Francis Grant possesses, with much cleverness, a sense of beauty derived from the best source, that is, the observation of really good society. . . . His former acquaintances render his immediate entrance into business completely secure. He has I think that degree of force of character which will make him keep and enlarge any reputation which he may acquire. He has confidence, too, in his own powers, always requisite for a young gentleman trying things of this sort, whose aristocratic pretensions must be envied." Sir Walter's anticipations have been fully verified. Mr. Grant's aristocratic connections—enlarged by his marriage with a niece of the Duke of Rutland—introduced him at once into an ample and lucrative business, and his popularity with the fashionable world has always been maintained. Probably no living portrait painter has painted anything like so large a number of members of the higher classes of both sexes; and his sitters have included the élite of the political as well as the fashionable world. Sir Walter Scott suggested the secret of his success (apart from aristocratic connection) in speaking of his "sense of beauty" derived from "the observation of really good society." All his portraits have a "good-society" air. His men, if not manly, are gentlemanly, his women, if not handsome, are elegant; and if neither sex is distinguished by an intellectual, both are by a nonchalant expression. He is eminently the painter of the "really good-society" classes, and he has caught to perfection their easy, listless airs and attitudes. Probably, if his faces seldom wear any marked appearance of intelligence, it is not the painter's fault. The technical qualities of Mr. Grant's pictures are not of a high order. The drawing is commonly negligent, the composition commonplace, and the colouring meagre, cold, and poor. Many of his portraits are painted on canvass of the largest size, and of course with increase of size the evidences of imperfect artistic education and neglect of study are increasingly manifest.

In the early part of his career Mr. Grant used to paint sporting compositions, embracing the portraits of a number of horses as well as men, such as the 'Meet of the Queen's Stag-hounds,' 'Shooting Party at Ranton Abbey, the Earl of Lichfield's,' 'Sir Richard Sutton's Hounds,' the 'Melton Hunt,' &c., some of which were engraved and enjoyed considerable popularity among sporting men, but he has for

many years ceased to practise this branch of art. Mr. Grant was elected A.R.A. in 1842—the year following the exhibition of his equestrian portrait of her Majesty—and R.A. in 1851.

* GRANT, ROBERT EDMUND, M.D., a distinguished comparative anatomist and zoologist, was born at Edinburgh on the 11th of November 1793, and is the seventh son of the late Alexander Grant, Esq., writer to the Signet in that city. Dr. Grant received his early education from a private tutor, and subsequently was a pupil at the High School, Edinburgh, where he remained five years. His favourite studies as a youth, and in which he was most distinguished, were Greek and Geometry. He early displayed a love of natural scenery and objects, spending his school-boy vacations in pedestrian excursions amongst the hills and valleys of Scotland. This love of travel has never forsaken him, and it is recorded of him that "he had already crossed the entire chain of the Alps seven times, and four times the Apennines, and walked alone many thousand miles through Europe before 1820. In 1808 he entered the literary classes of the University of Edinburgh, and in 1809 he added to these the classes of chemistry and anatomy. The four subsequent years were devoted to the more especially medical classes, as he was now intending to make medicine his profession. As a student he was distinguished for his devotion to anatomical and physiological pursuits. In 1811 he joined the Medico-Chirurgical Society of Edinburgh, and in 1812 was elected president of that society. He was also a member of the Royal Medical Society of Edinburgh, and in 1814 was made its president. On the 3rd of May 1814 he obtained the diploma of the Royal College of Surgeons of Edinburgh, and in June of the same year he graduated as M.D. His father having died, he now resolved on spending his patrimony in improving his scientific and professional knowledge by travel. He accordingly went to the continent, and visited Paris, Rome, Pisa, Padua, the capitals of Germany, Prague, Vienna, and the universities of Switzerland. After visiting the provincial schools of France, he returned to Paris and London, and commenced the practice of his profession in Edinburgh in 1820.

In 1824 Dr. Grant joined Dr. John Barclay in a course of lectures on Comparative Anatomy in Edinburgh. He thus realised one of the great objects of his life, that of becoming a teacher of the great science of Comparative Anatomy, a profound knowledge of which he had acquired by his laborious studies on the Continent. He now occupied himself with original researches upon the animals of the coasts of Scotland, and spent his vacations in making these researches. The results of his labours at this time were published in the 'Transactions of the Wernerian Society,' and in the 'Edinburgh New Philosophical Journal.' Amongst the more important of these we may mention the following:—'On the Structure of the Eye of the Sword-Fish,' 'On the Anatomy of the Paca of Brazil,' 'On the Structure and Functions of the Sponge.' This last was but the beginning of a series of papers on the forms, structure, and functions of the family of sponges, which constitute a series of the most remarkable contributions to the science of comparative anatomy and zoology produced during the present century. So complete are they that few observations of any importance have been contributed to our knowledge of this family since. The family of Sertularian Zoophytes was also carefully investigated by Dr. Grant, and interesting observations were made on the spontaneous motions of the ova of these animals, and on their structure and modes of generation. These and other papers of this time indicate not only considerable powers of observation, but an extensive knowledge of what had been done by other writers, more especially on the Continent.

In 1827 Dr. Grant obtained admission as a licentiate of the Royal College of Physicians of Edinburgh. This he did with the design of continuing to practise his profession in Edinburgh; but a circumstance occurred at this time which entirely changed his prospects and position in life. The educational establishment now known as University College was started with the style and title of the London University. Amongst other objects, this institution contemplated the granting of medical degrees, and demanding of its graduates a much more extended and complete course of education than is at present required by any of the medical examining bodies. At that time there was no professorship of comparative anatomy and zoology in Great Britain, and they determined to institute a chair for teaching these subjects: having done so, Dr. Grant was invited to fill the new position. This post he accepted, and delivered his introductory lecture on the 23rd of October 1828. From that time to this, under all the changes of circumstances to which this institution has been exposed, Dr. Grant has continued the earnest, simple-minded, laborious, and eloquent expositor of the great principles of the sciences he has professed. Of the large staff of professors which were appointed at the opening of the college, he is the only one who has retained his position. The courses of lectures on Comparative Anatomy and Zoology are not compulsory on medical students, and therefore Dr. Grant's lectures have not been largely attended; but he has had the gratification of giving instruction to many who are now eminent on the subjects of his teachings; and if his pecuniary emolument, from the system adopted at the institution with which he is connected, has been very far below his merits, he has had the satisfaction of spending a laborious life in diffusing to the utmost of his power the vast stores of knowledge which he has accumulated.

One of the courses of his lectures delivered in the session of 1833-34 was published in extenso in the pages of the 'Lancet.' These lectures, when published, constituted by far the best treatise that existed in our language on the subject of comparative anatomy. In the department of osteology it was especially rich, and for the first time presented to the English reader those theoretical views of the structure of the vertebrate skeleton which have since become so widely extended and adopted by British anatomists.

In 1833 Dr. Grant delivered a course of lectures before the Zoological Society of London on the Structure and Classification of Animals. In 1837 he was appointed Fullerian Professor of Anatomy and Physiology at the Royal Institution of Great Britain, a triennial appointment, which he discharged with great satisfaction to the members. He was subsequently appointed by the trustees under the will of the late Dr. Swiney to deliver a course of lectures on paleontology, an appointment he has several times fulfilled. Ever anxious to spread the great truths of his science, there are few institutions for the diffusion of knowledge throughout the country in which he has not delivered courses of lectures on some department of comparative anatomy and zoology.

In zoology Dr. Grant has not confined his studies to recent animals, and he has annually delivered a course of lectures on paleontology in University College.

Since his appointment to the professorship in University College, Dr. Grant has contributed largely to the literature of zoology, although the great demands made upon his time by his extensive courses and his annual visits during his vacations to the museums of the Continent have occupied the time which he would otherwise have undoubtedly devoted to literature. The 'Transactions of the Zoological Society' for 1833 contain three memoirs, one on the nervous system of the *Beroë pileus*, another on the structure of the *Loligopsis*, and the third on the anatomy of *Sepioida*. Dr. Grant was originally associated with Dr. Todd as editor of the 'Cyclopædia of Anatomy and Physiology,' and contributed to that work the articles 'Animal Kingdom,' 'Chyliferous System,' and 'Digestive Canal.' He also commenced in 1835 a great work entitled 'Outlines of Comparative Anatomy, presenting a sketch of the present state of knowledge and of the progress of discovery in that science, and designed to serve as an introduction to Animal Physiology, and to the principles of Classification in Zoology.' It is to be feared from the length of time since the first part was published that this work will now ever remain incomplete.

Dr. Grant is a fellow of the Royal, Linnæan, Zoological, Geological, and Entomological societies. Whilst men of less knowledge and less merit have been distinguished and rewarded, Dr. Grant has been remarkably overlooked. In his old pupils however he has firm friends and admirers; they recently afforded their admired teacher a proof of their regard by subscribing several hundred pounds, with a portion of which they purchased him one of the most perfect microscopes that could be constructed, and the rest was sunk for the purpose of affording him a small annuity for the rest of his life. We are principally indebted for this sketch to a biographical notice of Dr. Grant which appeared in the 'Lancet' for December 21st, 1850, and to the list of his works published in the 'Zoological and Geological Bibliography,' printed by the Ray Society.

* GRANVILLE, GRANVILLE GEORGE LEVESON GOWER, EARL, eldest son of the first Earl Granville, by the daughter of the fifth Duke of Devonshire. He was born May 11, 1815; educated at Eton, and Christchurch, Oxford, where he took his degree in 1834. In the following year he became *attaché* to his father's embassy in Paris, which however he soon left, and in 1836 was returned to parliament for the borough of Morpeth, and again in 1837; shortly afterwards becoming Under-Secretary for Foreign Affairs. In 1840 he was attached to the Russian embassy; but was again returned to parliament in the general election of 1841 for Lichfield. He spoke very seldom, and made no impression on the House. From this state of inactivity he was roused by the death of his father in 1846, which event of course called him to the House of Peers. At this time Lord John Russell's ministry was forming, and Lord Granville accepted office as Master of her Majesty's Buckhounds. This is at once the key to Lord Granville's public position. Although a man of undeniable business faculties, it is as a courtier and a gentleman that he is best known; and it is to graceful accomplishments that he owes the chance of cultivating those more solid capacities which he has since exercised. Mr. Milner Gibson found himself awkwardly placed as Vice-President of the Board of Trade: he was too radical for the government, whilst his views, necessarily compromised some little, were not sufficiently bold for his constituents. He resigned, and Lord Granville succeeded to the office; applying himself diligently, mastering details, and distinguishing himself for practical knowledge as well as by courtesy of demeanour. From holding this office, he became a commissioner of railways, and a trustee of the British Museum; and he will always be creditably remembered for his share in the Great Exhibition of 1851. He was a royal commissioner from the first; was Chairman of the Executive Committee, and contributed very largely, by his amiability and excellent management, to that unexampled cordiality and satisfaction which prevailed. When the commissioners and others were invited to Paris in return for similar courtesies shown in London, Lord Granville accompanied them,

and delighted the nobles and municipality of Paris, assembled in the Hôtel de Ville, by thanking them in a speech in their own language which was perfect in allusion, in accent, and in idiom. Froechmen might mistake Lord Granville for their countryman. When at the end of 1851 Lord Palmerston was ousted from the Russell Cabinet, for the indiscretion of recognising the new government of the French empire, without the Queen's knowledge, Lord Granville succeeded him—but the government broke up, giving him time to afford promise only of ministerial firmness and skill. That however he did, in the affair of Mr. Mather, who was cruelly sabred by an Austrian officer in Florence. He was subsequently President of the Board of Trade under Lord Aberdeen, and President of the Council under Lord Palmerston in 1855. He has also held the offices of Chancellor of the Duchy of Lancaster, Treasurer of the Navy, and Paymaster-General of the Forces. In 1856 he was sent as special ambassador to attend the coronation of the Emperor of Russia. He married in 1840 Maria, the daughter of the Duc de Dalberg, and widow of Sir Ferdinand Dalberg Acton, Bart. In politics he is a Liberal and a Free-trader.

GRATIANUS, AUGUSTUS, eldest son of Valentinian I., succeeded after his father's death, A.D. 375, to a share of the Western Empire, having for his lot Gaul, Spain, and Britain; his brother Valentinian II., then an infant five years old, had Italy, Illyricum, and Africa, under the guardianship however of Gratianus, who was therefore in reality ruler of all the West. His uncle Valens had the Empire of the East. Gratianus began his reign by punishing severely various præfects and other officers who had committed acts of oppression and cruelty during his father's reign. At the same time, through some insidious charges, Count Theodosius, father of Theodosius the Great, and one of the most illustrious men of his age, was beheaded at Carthage. In the year 378 Valens perished in the battle of Adrianople against the Goths, and Gratianus, who was hastening to his assistance, was hardly able to save Constantinople from falling into the hands of the enemy. In consequence of the death of his uncle, Gratianus, finding himself ruler of the whole Roman empire during the minority of his brother Valentinian, called to him young Theodosius, who had distinguished himself in the Roman armies, but had retired into Spain after his father's death. Gratianus sent him against the Sarmatians, who had crossed the Danube to join the Goths. Theodosius defeated them completely, and drove the remainder beyond that river. Gratianus then appointed him his colleague (in January 379), a choice wise and disinterested in the former, equally creditable to both, and fortunate for the empire, and gave him the provinces of the East. Gratianus returned to Italy, and resided some time at Milan, where he became intimate with Bishop Ambrose. He was obliged however soon after to hasten to Illyricum to the assistance of Theodosius, and he repelled the Goths, who were threatening Thrace. From thence he was obliged to hasten to the banks of the Rhine to fight the Alemanni and other barbarians. Having returned to Milan in the year 381, he had to defend the frontiers of Italy from other tribes who were advancing on the side of Rætia, and he ordered fresh levies of men and horses for the purpose. Gratianus enacted several wise laws: by one of them he checked mendicity, which had spread to an alarming extent in Italy; and he ordered all beggars to be arrested, and, if slaves by condition, to be given up as such to those who denounced them; if freemen, to be employed in cultivating the land. He also showed himself disposed to tolerance towards the various sects which divided Christianity; but he displayed a stern determination against the remains of the Heathen worship. At Rome he overthrew the altar of Victory, which continued to exist; he confiscated the property attached to it, as well as all the property belonging to the other priests and the Vestals. He also refused to assume the title and the insignia of Pontifex Maximus, a dignity till then considered as annexed to that of emperor. These measures gave a final blow to the old worship of the empire; and although the senators, who for the most part were still attached to it, sent him a deputation, at the head of which was Symmachus, they could not obtain any mitigation of his decrees.

Coin of Gratianus.

British Museum. Actual size. Gold. Weight 67½ grains.

Under the consulship of Merobaudus and Saturninus in 363, a certain Maximus revolted in Britain, and was proclaimed emperor by the soldiers, to whom he promised to re-establish the temples and the old religion of the empire. He invaded Gaul, where he found numerous partisans. Gratianus, who was then, according to some, on the Rhine, advanced to meet him. But he appears by an unbecoming indulgence in idle amusements to have disgusted the army, and he

now found himself forsaken by most of his troops, and obliged to hasten towards Italy. Orosius and others however state that the emperor received the news of the revolt while in Italy, and that he hurried across the Alps with a small retinue as far as Lyon. All however agree in saying that he was seized at Lyon and put to death by the partisans of Maximus. St. Ambrose, who ventured from Milan to the camp of Maximus to beg the body of his imperial friend, was refused; but some time afterwards the remains of Gratianus were transferred to Milan, where they were interred. He was little more than twenty-four years of age, and had reigned about eight years. The historians agree in praising him for his justice and kindness, and his zeal for the public good; and Ammianus Marcellinus, who is not liable to the charge of partiality towards the Christians, adds, that had he lived longer, he would have rivalled the best emperors of ancient Rome.

GRATIANUS, a Benedictine monk of the 12th century, a native of Tuscany, according to some, and resident at Bologna. He is chiefly known for his 'Collection of the Canons, or Decretals, of the Church,' which occupied him during twenty-four years, and which he published at Rome about the middle of the 12th century. The collection, which has become known by the name of 'Decretum Gratiani,' was first printed at Mainz, in folio, 1472, and forms part of the 'Corpus Juris Canonici.' Gratianus improved on the collectors of Decretals who had preceded him, especially Isidorus Mercator, who had heaped up indiscriminately and without order a number of decisions and canons, which were often discordant. Gratianus ranged them in order, and distributed them under distinct heads, endeavouring to explain the obscurities and reconcile the contradictions which appeared in some of them; but he retained at the same time, through want of authentic authorities and of enlightened criticism, many apocryphal canons, and many erroneous textual readings: he appears indeed to have felt his own deficiencies, for he honestly cautions his readers not to place implicit faith in his writings, but to scan them by the light of reason and by the test of moral evidence. ('Decret. Distinctio,' ix. ch. 3-5.)

As a proof of his honesty, and that, whatever may have been the effect of his authority, he had no intention to flatter the pretensions of the Roman see, one has only to read his 'Distinctio,' lxiil. ch. 22, 23, and 25, in which he says that the election of the pope is subordinate to the will of the emperor, as well as that of the bishops is to the choice of the various sovereigns; while in chapter 84 he even asserts that the clergy and the people ought to participate in the election of their respective bishops. And yet in another place, 'Distinctio,' x. ch. 1, &c. he asserts as a fundamental axiom that the imperial laws ought to yield to the ecclesiastical canons, without distinguishing between the canons which concern matters of dogma and those which relate merely to discipline or jurisdiction. The Abbé Fleury, in his 'Troisième Discours sur l'Histoire Ecclésiastique,' says that "Gratianus, besides so consolidating the authority of the false decretals that for three centuries after no other canons were referred to but those of his collection, went even farther in extending the authority of the pope by maintaining that he was not himself subject to the canons; an arbitrary assertion destitute of evidence, but which contributed to establish in the Latin, or Western, church a confused notion that the authority of the pope was without bounds. Gratianus also maintained, upon apocryphal or mutilated authority, that clergymen are not subject to secular jurisdiction. This principle is illustrated in a celebrated answer of Innocent III. to the Eastern emperor, in which that pope contends that the temporal sovereign has the jurisdiction of the sword over those who bear a sword, that is to say, over laymen only, as no one can be the judge of the servants of another."

The grosser errors and the apocrypha of the 'Decretum' were corrected and expurgated in an improved edition executed by order of Gregory XIII., 1582; but still many assertions favourable to the absolute supremacy as well as to the temporal authority of the pope were allowed to remain in it, as being sanctioned by ages, though contrary to the ancient discipline of the church. These are what are styled in France, and other countries north of the Alps, the ultramontane doctrines of the Roman Curia. Antonius Augustinus has written a treatise, 'De Emendatione Gratiani,' which forms a useful supplement to the 'Decretum.'

GRATTAN, HENRY, was born in Dublin in 1750. His father, a barrister and a Protestant, was recorder of Dublin and also its representative in the Irish parliament. Young Grattan entered at the usual age as a fellow-commoner at Trinity College, Dublin; and having there distinguished himself considerably, he proceeded to London, after taking his degree, for the purpose of keeping terms at the Middle Temple, and of studying law. He was called to the Irish bar in 1772. In 1775 he was returned to the Irish parliament, under Lord Charlemont's auspices, as representative of the borough of Charlemont.

In parliament, Grattan at once joined the ranks of opposition. Ertiring his nervous eloquence in the cause of his country's independence, he in a very short time gained to himself the admiration and love, while he contributed not a little to swell the enthusiasm, of the Irish nation. At this period Ireland had to complain, not only of the dependent state of her legislature and courts of justice, but also of grievous commercial restrictions; and one of the first great fruits of Grattan's zeal and eloquence was the partial throwing open of Irish commerce. Subsequently, in 1780, he obtained from the Irish parlia-

ment the memorable resolution "that the King's most excellent Majesty, and the Lords and Commons of Ireland, are the only power competent to make laws to bind Ireland." The peroration of the speech in which he moved this resolution is a noble specimen of his eloquence.

Such was the pitch of popularity to which Grattan had now attained, that it was proposed in the Irish parliament to vote him the sum of 100,000*l.*, "as a testimony of the national gratitude for great national services." The vote was afterwards reduced in committee, at the express instance of Grattan's own friends, to 50,000*l.*; and this sum Grattan received. In consequence of the declaration of rights of the Irish parliament, a negotiation was set on foot for the repeal of the act (6th of George I.) by which the British legislature declared its right to bind Ireland by British statutes. When the repeal of this act was brought forward in England, Mr. Flood contended in the Irish parliament that the simple repeal of a declaratory act, like that of the 6th of George I., would not involve a renunciation of the right; and after moving some other resolutions which implied dissatisfaction with a simple repeal of the act, and which were successively negatived without a division, he at last moved for leave to bring in a bill for declaring the exclusive right of the Irish parliament to make laws for Ireland. Grattan differed from the view taken by Mr. Flood, and contended that the simple repeal of the act was a sufficient security for the independence of Ireland. Mr. Flood's bill was thrown out by a large majority. But though the opinion of the Irish House of Commons was with Grattan, the sympathies of the Irish nation were with Mr. Flood. A belief gained ground, and was much encouraged by Mr. Flood's acrimonious attacks, that having received his reward Grattan had ceased to be a patriot; and he now for a time undeservedly lost much of his well-earned popularity.

His opposition however in 1785 to the propositions regarding the trade between Great Britain and Ireland, moved by Mr. Orde in the Irish parliament, and ever since well known as Orde's Propositions, restored him to his lost place in the affections of his countrymen. One of these propositions was to the effect that the Irish parliament should from time to time adopt and enact all such acts of the British parliament as should relate to the regulation or management of her commerce. The Irish parliament would thus have been placed so far in a state of complete dependence; but owing principally to Grattan's efforts in opposition, the measure was relinquished; and he went on to secure a continuance of his now regained popularity by the introduction of a measure for getting rid of tithes, which was however rejected. Occupying moreover the leading place in the Whig Club which then existed in Dublin, Grattan succeeded in obtaining a public declaration from its members that they would never accept office under any administration which would not concede certain measures tending to increase purity of election and ministerial responsibility. In 1790 Grattan was returned to parliament for Dublin.

In the parliament which now met, the question of Roman Catholic Emancipation being raised, Grattan appeared of course as the friend of religious liberty. He thereby offended his new constituents. There is no doubt that the course which he took upon this question would have prevented his re-election, had he desired it; but finding himself unable to stem that movement which, originating with the recal of Lord Fitzwilliam, terminated in the rebellion of 1798, he voluntarily retired from parliament. He was afterwards returned for Wicklow, for the express purpose of opposing the Union. The Union was carried, and in 1805 he entered the imperial parliament as member for the borough of Malton. The next year he was returned for Dublin. Preserving in his new position the reputation which he had before acquired for eloquence, he also adhered inflexibly to those principles of toleration and popular government of which in Ireland he had been the champion. He lost no opportunity of advocating the Roman Catholic claims. He may be said indeed to have died in the cause of Roman Catholic Emancipation. He had undertaken to present a petition from the Irish Roman Catholics, and to support it in parliament, notwithstanding the remonstrances of his friends that the exertion would be incompatible with his declining health. "I should be happy," he replied to those remonstrances, "to die in the discharge of my duty." He had scarcely arrived in London with the petition when his debility greatly increased. He died on the 14th of May 1820, at the age of seventy. His remains were interred in Westminster Abbey; and on the occasion of moving for a new writ for the city of Dublin, Sir James Mackintosh pronounced an eloquent eulogium on his life and character.

There is no need to dwell on the public character of Grattan, inasmuch as his honesty and consistency never having been impeached it requires no defence. In private life he was irreproachable. "He is one of the few private men," says Sir James Mackintosh, "whose private virtues were followed by public fame; he is one of the few public men whose private virtues are to be cited as examples to those who would follow in his public steps. He was as eminent in his observance of all the duties of private life as he was heroic in the discharge of his public ones."

Grattan's speeches were collected and published by his son, in 4 vols. 8vo, in 1821. There is also a volume of his miscellaneous works.

GRAUN, CARL HEINRICH, a German composer of great celebrity

during part of the last century, and kapellmeister, or director of music, to Frederick II. of Prussia, was born in Saxony in 1701. As a boy he was entered at the school of La Sainte Croix, at Dresden, where the beauty of his soprano voice soon procured him the situation of state singer. This voice afterwards changed into a high tenor of no great power, but of excellent quality. He studied composition under Schmidt, kapellmeister at Dresden, and leaving the school in 1720 he commenced composing for the Church. In 1725 he succeeded Hasse as principal tenor in the opera at Brunswick, but not quite approving the airs allotted to him, he wrote one for himself, which so much pleased the court that he was immediately appointed composer to the opera. Subsequently he entered into the service of the prince royal of Prussia (afterwards Frederick the Great), for whom he composed and sung cantatas, &c. These were very numerous, and so satisfactory to the royal dilettante, that Graun's salary was augmented from a small pittance to 2000 crowns per annum. He died in 1759, in the service of Frederick, who was so much attached to him that he wept when the death of his favourite was announced. Graun was a most voluminous composer, and many of his works perhaps deserved at the time the encomiums lavished on them; but of these few are known, even in Germany. His operas, which are numerous, are quite forgotten. His short oratorio, 'Der Tod Jesu' ('The Death of Christ'), possesses very considerable merit; but his name will be transmitted to posterity by his 'Te Deum,' a work of invention, beauty, and grandeur.

GRAVELOT, HUBERT FRANÇOIS D'ANVILLE, designer and engraver, was born at Paris in 1699. He was the brother of D'Anville the eminent geographer. When about thirty years of age, Gravelot commenced the study of painting under Restout; but he eventually adopted designing, and established himself in London as a designer and etcher about the year 1732, and found considerable employment. He returned however to Paris in 1745, and obtained considerable reputation there, chiefly as a designer. His principal works are—the drawings for the monuments of kings for Vertue; many of the etchings to Sir Thomas Hanmer's edition of 'Shakspeare,' after his own and Hayman's designs; also those for Theobald's 'Shakspeare,' from his own designs; a large print of Kirkstall Abbey; and many ornamental designs executed in England. In Paris he designed the illustrations for Luneau de Boisjermain's 'Racine,' for the great edition of the works of Voltaire by Pancoucke; and for editions of the 'Contes Moraux' of Marmontel, and of the works of Boccaccio and of Ariosto. He died in 1773.

GRAVES, RICHARD, was born at Mickleton, in Gloucestershire, in 1715, received his academical education at Pembroke College, Oxford, and in 1736 was elected fellow of All Souls. Having taken orders and married, he obtained, about 1750, the rectory of Claverton, near Bath, in Somersetshire, where the remainder of his long life was spent. He engaged in private tuition with credit and success, and still found time to devote to polite literature. (See the list of his works, too long and insignificant for insertion, in the 'Gent. Mag.,' vol. lxxiv. p. 1166, copied by Chalmers.) The only one now remembered (and that by few) is the 'Spiritual Quixote,' 1772. This novel was written as a satire on the Methodists; it is clever, lively, and amusing, and shows that Mr. Graves possessed considerable power as a writer of fiction. But like other occasional publications, its popularity passed with the interest of the subject; not to say that the recognised respectability and utility of the Methodist clergy have rendered society in general less inclined to look favourably on a violent attack on the whole body, founded on the follies or vices which individuals may have shown; and the profuse and somewhat irreverent introduction of scriptural language is offensive to a large class of readers. Mr. Graves was beloved in society for his gay ready wit and good humour; he was intimate with Shenstone and other writers admired in their day, but now forgotten. He died at Claverton on the 23rd of November 1804, nearly ninety years old.

GRAVESANDE, ST. [ST. GRAVESANDE.]

GRAVINA, GIOVANNI VINCENZO, born at Ruggiano in Calabria in 1664, studied at Naples, where he devoted himself chiefly to the investigation of jurisprudence, ancient and modern. He afterwards went to Rome, where he and Crescimbeni were the founders of the Accademia degli Arcadi, which has continued ever since. In 1698 Innocent XII. appointed him professor of civil and canon law in the University of Rome. Gravina gave up his chair in 1714, and visited Calabria, but after two years he returned to Rome, where he refused several offers of professorships in various German universities. Victorius Amadeus, king of Sardinia, having offered him the chair of law in the University of Turin, together with the prefectship of that institution, Gravina was preparing to remove thither, but he died in January 1718. He left all his property to his disciple Trappasi, commonly called Metastasio, whom he had brought up in his house like a son. The principal work of Gravina, for which he ranks high among jurists, is the 'Originum Juris Civilis, libri tres.' In the first book, 'De Ortu et Progressu Juris Civilis,' he traces the origin of jurisprudence from the first institutions of Rome, from the division of the population into orders, from the political condition of the infant state, and from the laws of the kings collected afterwards by Sextus Papirius, and known by the name of Jus Papirianum, of which fragments have been preserved. This book is in fact an elaborate treatise on the early

civil and political system of Rome. In the second book, 'De Jure Naturali Gentium, et XII. Tabularum,' he follows the progress of legislation in Rome under the Republic, and he shows the connection between the Roman laws and the general principles of justice, which the Romans seem to have kept in view in their civil enactments more than any other nation of antiquity. The author also carefully illustrates the fragments of the Twelve Tables. The third book, 'De Legibus et Senatibus Consultis,' completes this sketch of Roman jurisprudence; and the author treats at length of the opinions or decisions of the Roman jurists, who were often consulted by the senate, and whose 'Responsa' form a most important part of the Roman law. He also treats of the modern jurists who lived after the restoration of the Roman law in the West, beginning from Irenaeus, or Varnerius, a professor of Bologna in the 11th century, who, at the desire of the Countess Mathilda, revived the knowledge of the Justinian Code many years before the reported discovery of the Pandects by the Pisani at Amalfi, and passing in review those who followed in successive ages down to his own time. The publication of the 'Originum Juris Civilis' attracted universal attention throughout Europe, and Montesquieu and other competent judges have bestowed praise on the manner in which the author handles his subjects, and the many luminous principles and happy definitions contained in the work. The best edition is that of Leipzig, 2 vols. 4to, 1737. It has been translated into French under the title of 'Esprit des Loix Romaines,' Paris, 1766. Gravina wrote also—1. 'De Romano Imperio liber singularis,' an inferior performance, in which the author seems intent on flattering the vanity of the modern Romans. 2. 'Della Ragion Poetica,' being a treatise on the art of poetry. 3. 'Institutiones Canonicae,' published at Turin after his death; besides several very inferior tragedies, some orations, and other opuscula. Fabroni published a biography of Gravina. (Corniani, *Secoli della Letteratura Italiana*, art. 'Gravina.')

* GRAY, JOHN EDWARD, Ph. D., F.R.S., a distinguished living naturalist, the head of the natural history department of the British Museum. The history of this eminent naturalist is essentially connected with the national institution to which he has been attached for upwards of thirty years. Within the last fifty years the British Museum has had annually large sums spent upon its collections, and in no department has its progress been more conspicuous than that of natural history. With the exception of the mineralogy, paleontology, and botany, the whole has been under the direction of Dr. Gray; and if at the present moment it can boast of being the largest and most complete museum in the world, it is mainly due to the energy, perseverance, and extensive knowledge that he has brought to bear upon its management. But whilst Dr. Gray has been thus engaged in superintending the collection and arrangement of this vast museum, he has not lost any of the great opportunities it has afforded him of adding to the literature of zoology. He possesses a remarkable power of seizing on the distinguishing features of animal forms, and his position has enabled him to describe and classify a larger number than has perhaps been done by any other naturalist. For the last thirty years his contributions to the literature of zoology have been constant and unceasing. The mere list of his papers, memoirs, and works occupies several pages of the 'Bibliography of Zoology and Geology of Agassiz and Strickland.' At the date of the publication of that work (1852) they amounted to 425, and a large number have been added since. The most conspicuous of these works are the catalogues of the British Museum. Of these, the whole series of which are not concluded, the *Mammalia*, the *Reptiles*, the *Mollusca*, and a large proportion of the *Radiata*, have been executed by Dr. Gray himself. Many of these catalogues are not mere lists of the animals in the museum, but contain an extensive synonymy and copious notes on specimens, and on the habits and uses of the particular species described.

The writings of Dr. Gray may be divided as follows:—1, On the general subject of Natural History; 2, on the *Mammalia*; 3, on Birds; 4, on Reptiles; 5, on Fishes; 6, on Articulate Animals; 7, on the *Mollusca*; 8, on the *Radiata*. Under the first head may be included the 'Zoological Miscellany,' published from 1835 to 1845, and including descriptions of various animals; his 'Synopsis of the Contents of the British Museum,' published in 1840; also various papers on the classification of the animal kingdom, such as his memoir 'On the Characters separating the four great divisions of the Animal Kingdom,' published in the 'Annals and Magazine of Natural History,' vol. xix.; his zoological articles in the 'Encyclopedia Metropolitana'; a paper read at the British Association in 1841, 'On the Geographical Distribution of the Animals of New Holland'; 'Illustrations of Indian Zoology,' London, 1830; 'Spicilegium Zoologica, or original figures and short systematic descriptions of New and Unfigured Animals,' 1828-30; 'Gleanings from the Menagerie and Aviary at Knowsley Hall,' 1846-50. His evidence before the Select Committee of the House of Commons on the British Museum, and before the commissioners on the state of the British Museum, at various times from 1837 to 1849, and his report to the same commission, contain a large body of important and valuable information on the subject of museums generally, and the management of the natural history department of the British Museum.

His papers on the *Mammalia* in particular embrace the descriptions of a large number of new species, and have been furnished to various scientific journals, or have appeared in the volumes devoted to the description of the natural history collections of various travellers.

As examples of the papers we may refer to his 'Description of some New Genera, and Fifty unrecorded Species of Mammalia,' in the tenth volume of the 'Annals and Magazine of Natural History.' The *Mammalia* collected in King's survey of the coast of Australia, in the voyages of the Erebus and Terror, and of the Samarang, were described by Dr. Gray. Every order into which the large class of *Mammalia* has been divided has met with attention from Dr. Gray, and he has added not a few genera and species to these prominent forms of the animal kingdom. The catalogues of the British Museum, embracing the *Ruminantia* and the *Cetacea*, are the most complete amongst the *Mammalia*, and contain a large amount of valuable and interesting information. The number of Dr. Gray's papers devoted to the *Mammalia*, contained in Agassiz's 'Bibliography,' amounts to one hundred and two.

To the Birds, Dr. Gray has not devoted so much attention. This department in the British Museum is ably superintended by his brother, Mr. GEORGE ROBERT GRAY, who is known all over the world for his 'Genera of Birds,' and who has written the British Museum Catalogues embracing this class of animals. Nevertheless Dr. Gray has at various times exercised his critical powers upon the family of Birds, and demonstrated that he is as familiar with this as any other class of animals. His papers on Birds amount to twenty-nine in number.

It is however as a herpetologist that Dr. Gray has most distinguished himself. The class of Reptiles has received at the hands of naturalists a neglect which can only be accounted for on the supposition that the general disgust at these creatures is participated in by even philosophers themselves. Dr. Gray has however not shared in this feeling, and has devoted a larger portion of his attention to these animals than any other. His 'Synopsis of the Species of the Class Reptilia,' in Griffith's translation of Cuvier; 'Outline of the Arrangement of Reptiles, with Characters of Families and List of Genera'; 'New Arrangement of Reptiles,' in the first volume of the 'Annals and Magazine of Natural History'; the 'List of Reptiles in Australia,' in King's 'Survey'; the 'General Arrangement of the Reptilia,' in the 'Proceedings of the Zoological Society'; the 'Systematic Arrangement of Reptiles,' in the 'Synopsis of the Contents of the British Museum;' are all proofs of how large a share of his attention has been given to the class of Reptiles. To these must be added upwards of sixty papers, describing new species brought from various parts of the world, or devoted to a consideration of their structure and habits.

The Fishes have perhaps received less attention from Dr. Gray than any of the vertebrate animals. This arises however from a very obvious circumstance. Fishes cannot be skinned and preserved dry with so much facility as other animals, and there has always existed a prejudice in the British Museum with regard to moist preparations. Hence the museum has been devoted rather to the illustration of the external forms of animals than to their internal structure, and Dr. Gray has not had the opportunity of studying fish as he has had of other animals. He has however described several new species of fishes, and published a 'List of the British Fish in the Collection of the British Museum.' His papers on this department of zoology amount to twenty in number.

The whole collection of Shells in the British Museum, exceeded however both in number and value by the private collection of Mr. Hugh Cuming, has afforded to Dr. Gray great opportunities of studying the *Mollusca*. His labours are more complete in this department perhaps than any other. Not only has he published papers and memoirs on the arrangement and classification of the shells of these animals, but many on their habits, structure, economy, and use, as the following papers indicate:—'On the Eyes of Mollusca'; 'On the Structure of Pearls'; 'On Perforations made by Patella and Pholas'; 'On the Byassus of Unio'; 'Observations on the Economy of Molluscous Animals, and on the Structure of their Shells.' This last paper was printed in the 'Philosophical Transactions,' and afterwards in Johnston's 'Introduction to Conchology.' At the same time that Dr. Gray, in his papers on *Mollusca*, has displayed his appreciation of the importance of the study of comparative anatomy, one of the great defects discoverable in his contributions to systematic zoology is a want of recognition of the labours of the anatomist. This has probably arisen from the defective constitution of the British Museum, in which no arrangement has hitherto been made for displaying the internal structure of animals—a condition at least as necessary for the study of animal life as the exhibition of their external forms. Dr. Gray's papers on the subject of the *Mollusca* amounted in 1852 to the large number of one hundred and nineteen, and many have been added since. The most important of these is his 'Systematic Arrangement of Molluscous Animals, with Characters of Families.' We ought also to add here that Dr. Gray has an admirable assistant in his conchological studies in Mrs. Gray, who has published a work consisting of 'Figures of Molluscous Animals, for the Use of Students,' descriptions of which have been given by Dr. Gray.

In the remaining divisions of the animal kingdom Dr. Gray has not been idle. Upwards of seventy papers attest his industry in the study of Articulate and Radiate Animals. These have been more especially devoted to those specimens which form part of the dry collection of the British Museum. Thus the *Crustacea*, Insects, and Cirripedes amongst the articulate, and the Star-Fishes, Sea-Eggs, Sponges, and

Zoophytes amongst the radiate, have obtained the largest amount of attention from Dr. Gray.

Whilst Dr. Gray has thus obtained a pre-eminent position as a zoologist, he is President of the Botanical Society of London, thus indicating his claims to be regarded as a naturalist by whom no department of natural history has been neglected. He is a Fellow of the Royal Society, and an active member of the Council of the Zoological Society.

GRAY, THOMAS, was born in Cornhill on the 26th of December, 1716. He was the fifth among twelve children of a respectable citizen and money scrivener in London, and the only one of the twelve who survived the period of infancy.

Gray was sent to be educated at Eton, where a maternal uncle, of the name of Antrobus, was one of the assistant masters. It may be mentioned, that at Eton, and afterwards at Cambridge, Gray was entirely supported by his mother; the father, who was a selfish, violent, and unprincipled man, having chosen to refuse all assistance towards his son's education. At Eton Gray made himself a good classic; and here too began that friendship with West which, shortly terminated by the premature death of the latter, yet forms one of the most interesting features in the history of Gray's early manhood. Horace Walpole was another of his intimate associates at Eton, and, removing thence to Cambridge at the same time with Gray, continued to be so there: West went to Oxford. It was in the autumn of 1735 that Gray commenced his residence at Cambridge, having entered at Peter House; and he continued to reside till September 1738, when he left without a degree. He professed to hate mathematics, and college discipline was irksome to him. "You must know," he writes in his second year to his friend West at Oxford, "that I do not take degrees, and, after this term, shall have nothing more of college impertinences to undergo." His time at Cambridge was devoted to classics, modern languages, and poetry; and a few Latin poems and English translations were made by him at this period.

In the spring of 1739 Gray set out, in company with Horace Walpole, and at his request, on a tour through France and Italy. They passed the following winter at Florence with Mr. (afterwards Sir) Horace Mann, the envoy at the court; and after visiting Rome and Naples, and seeing the remains of Herculaneum, which had only been discovered the year before, they passed eleven months more at Florence. While here Gray commenced his Latin poem 'De Principiis Cogitandi.' But the travellers afterwards quarrelled, Gray being, as Horace Walpole has it, "too serious a companion." "I had just broke loose," says Walpole, "from the restraint of the university, with as much money as I could spend; and I was willing to indulge myself. Gray was for antiquities, &c., whilst I was for perpetual balls and plays: the fault was mine." ('Walpoliana,' l. cx.) Gray turned his steps homewards, and arrived in England in September 1741, just in time to be present at his father's death.

Gray had intended, on leaving Cambridge, to devote himself to the study of the law. His travels had now, for two years and a half, diverted him from this object; and after his father's death he appears entirely to have given it up. He went to reside at Cambridge for the professed purpose of taking the degree of Bachelor of Civil Law, but continued to reside there after taking the degree. Enjoying opportunities of books which he could not command elsewhere, he devoted himself with much ardour to the perusal of the classics, and at the same time cultivated his muse. The 'Ode to Spring' was written in 1742, and sent, like most of his previous compositions, to West, who however had died before it reached him; and in the autumn of the same year, were written the 'Ode on a Distant Prospect of Eton College,' and the 'Hymn to Adversity.' The 'Elegy in a Country Churchyard' was also commenced at this period, but not finished till seven years afterwards. In the meanwhile the 'Ode to Eton College' had been published (being the first of Gray's publications) in 1747, and little notice had been taken of it. The 'Elegy,' published in 1749, rapidly obtained an extensive popularity.

In March 1753 Gray lost his mother, for whom he had always felt the strongest affection, and whom, according to Mr. Mason, he seldom afterwards mentioned without a sigh. During the three years following Horace Walpole observes that Gray was 'in flower.' The 'Ode on the Progress of Poetry' and the 'Bard' were then written. But it was during these three years also that a material change for the worse took place in Gray's health, and that he began to be visited with alarming attacks of the gout, which embittered the remainder of his days, and ultimately carried him off.

In 1756 Gray having experienced some incivilities at Peter House, removed, or (in the technical phrase) migrated to Pembroke Hall. In 1757 he took his last two odes to London to be published. They were not eminently successful. But Gray's reputation had been already established; and on the death of Cibber in the same year he was offered the laureateship by the Duke of Devonshire, which however he refused. He applied himself now for some time to the study of architecture; and from him Mr. Bentham derived much valuable assistance in his well-known 'History of Ely.' In 1765 he visited Scotland, and was there received with many signs of honour. The University of Aberdeen proposed to confer on him the degree of Doctor of Laws; but he declined the honour, thinking that it might

appear a slight and contempt of his own university, where he says "he passed so many easy and happy hours of his life, where he had once lived from choice, and continued to do so from obligation." In 1768 the professorship of modern history at Cambridge became vacant, and Gray, who on the occasion of the preceding vacancy had applied unsuccessfully, was now appointed by the Duke of Grafton. In the succeeding year the Duke of Grafton was elected chancellor of the university, and Gray wrote the installation ode, a poem which, considering the subject and the occasion, is singularly chaste and free from flattery. In the spring of 1770 illness overtook him, as he was projecting a tour in Wales; but recovering, he was able to effect the tour in the autumn. His respite however was but a short one; and having suffered for some months previous from a violent cough and great depression of spirits, he was suddenly seized, on the 24th of July 1771, with an attack of the gout in the stomach, which caused his death on the 30th of the same month. He died in his fifty-fifth year.

The life of Gray is one singularly (even for an author) devoid of variety and incident. It is the life of a student giving himself up to learning, and moreover accounting it an end in itself, and its own exceeding great reward. For it is not so much that he kept aloof from the active pursuits of life for the purpose of authorship, as that he comparatively sacrificed even this and the fame which belongs to it, by devoting his time almost entirely to reading. Writing was with him the exception, and that too a rare one. His life was spent in the acquisition of knowledge; and there is no doubt that he was a man of considerable learning. His acquaintance with the classics was profound and extensive. He had thought at one time of publishing an edition of Strabo; and he left behind him many notes and geographical disquisitions, which, together with notes on Plato and Aristophanes, were edited by Mr. Mathias. He was besides a very skilful zoologist and botanist. His knowledge of architecture has been already mentioned. He was well versed moreover in heraldry, and was a diligent antiquarian.

He wrote little; but as is often the case with those who write little, the little that he wrote was written with great care. Thus his poems, with the exception of one or two of a humorous character, are all much elaborated; and it follows that the quality which they chiefly display is taste. Gray was indeed emphatically a man of *taste*. He did not possess, as has been loosely said by many of his admirers, a vivid and luxuriant imagination, else he would in all probability have written more.

A scanty writer, Gray was also a scanty converser; and we learn from Horace Walpole that his conversation partook also of the studied character of his writing. Writing on one occasion to Mr. Montagu, Walpole says, "My Lady Ailesbury has been much diverted, and so will you too. Gray is in their neighbourhood. They went a party to dine on a cold loaf, and passed the day. Lady A. protests he never opened his lips but once, and then only said, 'Yes, my lady, I believe so.'" But Walpole wrote for effect, and so that that was attained he paid little regard to veracity. Yet it may be taken for granted that the anecdote, however exaggerated, bore some semblance of probability. With his intimate friends Gray was certainly less reserved; and to them his conversation was learned and witty. It is unnecessary, after the account which has been given of Gray's life, to dwell on the amiability of his character, his affectionateness, and humility.

His friend Mason the poet published a Memoir of Gray, and also his Letters, which have served as the basis of the subsequent lives of Gray. An edition of Gray's works, containing, as has been said, his classical notes and disquisitions, as well as his poems and letters, was published by Mr. Mathias, in 2 vols. 4to, in 1814. An edition of his poems and letters alone has been published by Mr. Mitford, first in 1816, in 2 vols. 4to, and very recently in 4 vols. 12mo. To both of Mr. Mitford's editions is prefixed a memoir of Gray, which is on the whole the best that has appeared; but a more valuable addition to our stock of information respecting Gray was afforded by an edition of 'Gray's Correspondence with Mason,' &c., published by Mr. Mitford in 1853, and which showed what had not previously been suspected, that Mason used a most unwarrantable licence in printing the Letters of Gray, by altering them in various ways to suit his own notions.

GREAVES, JOHN, an eminent English mathematician, scholar, and antiquary, was born at Colmore, near Alresford, Hants, in 1602; went to Balliol College, Oxford, in 1617; was elected fellow of Merton in 1624, and appointed geometry professor of Gresham College, London, in 1630. In 1637 he undertook a journey to the Levant and Egypt, with the view of examining such antiquities as might serve to illustrate ancient authors, and of making astronomical and geographical observations. He spent about a year at Constantinople, and in the summer of 1638 proceeded to Egypt, where his chief performance was a survey of the pyramids, of which no satisfactory account was then extant; this was published under the title 'Pyramidographia,' in 1646. On his return he spent some months in visiting the chief cities of Italy, studying their antiquities, and consulting their libraries; and reached England early in 1640. He took up his abode at Oxford, and having been appointed Savilian professor of astronomy in November 1643, was immediately after very properly deprived of his Gresham professorship for neglect of duty. Being of the Royalist party he was ejected from both fellow

ship and professorship in 1648; a matter of the less moment, inasmuch as he had a competent patrimony. He died October 8, 1652.

Mr. Greaves paid much attention to weights and measures, and published in 1647 a 'Discourse on the Roman Foot and Denarius, from whence, as from two Principles, the Measures and Weights used by the Ancients may be deduced.' The bulk of his works relates to Oriental geography and astronomy. He wrote a Persian grammar, and made some progress in a Persian lexicon. In 1645 he proposed a scheme for gradually introducing the Gregorian alteration in the calendar, commonly called New Style, by omitting every 29th of February for forty years. A collection of his minor pieces was published by Dr. Birch in 1737, 2 vols. 8vo.

(Ward, *Lives*.)

GRECH or GRETSCH, NIKOLAY IVANOVICH, an able and very industrious Russian author, some of whose works are, from the judgment which has been shown in the choice of their subjects, indispensable in a Russian library, and also of general interest. Grech, who was born at St. Petersburg on the 3rd of August (old style) 1787, is the descendant of an old Bohemian family, bearing for arms, appropriately enough, a pen. His ancestors in the 17th century embraced the Protestant faith, and were compelled in consequence to take refuge in Prussia. His grandfather, who studied at Leipzig and Marburg, became acquainted with some Russian students there, learned their language, obtained a professorship first at the grammar-school of Mittau, and afterwards at St. Petersburg, and in 1758 published a work in Russian on 'Political Geography.' The professor's son, Ivan Ivanovich, a lawyer, became secretary for Polish and German affairs to the Senate at St. Petersburg; but instead of making a fortune, as is usually the case with those who hold the post, was recorded in the newspapers of 1803 to have died so poor that his effects were sold by auction for forty-one roubles. His son was thus left at sixteen to make his own way in the world, and give what assistance he could to the rest of the family. Originally intended for a lawyer, he had been educated at the School for Young Gentlemen of Birth, which was then the first stepping-stone to a legal career in the Russian capital, and at the age of seventeen he was introduced to a clerkship in the 'chancery' of one of the government offices; but he soon resigned the monotonous employment in disgust, and for some years earned a livelihood by the business of teaching, while diligently occupying his spare time in the improvement of his own education. He continued partly engaged in tuition, chiefly in teaching the Russian language, till 1816, when he resigned his post at the Pedagogic Institute, which has since been erected into the University of St. Petersburg. His great ambition however, even from boyhood, was to become an author. He tells us, in an amusing paper of his own recollections, first published in Smirdin's 'Novosel'e,' that the first author he ever saw was Tumansky, who had written a now-forgotten history of Peter the Great, and came on some legal business to his father. "I could not," says Grech, "take my eyes off him; and squeezing into a corner of the room, I kept repeating to myself, 'That is an author; that is the author of a book: what comes into his head is read by thousands in all corners of Russia, and will be read even after his death.'" The next author he saw was of a different cast. In 1803 Derzhavin [DERZHAVIN], who was before the appearance of Pushkin the greatest of Russian poets, and who at that period was the minister of justice, came to one of the examinations of the school of Young Gentlemen of Birth. Grech, who was the first pupil called up before him, was unable to answer a question. "I saw," he says, "neither the uniform, nor the stars, nor the ribbons; but I looked at him instantly in the face, and rushing through my mind were the 'Ode to God,' the 'Waterfall,' and the rest. 'Tell us the position and the divisions of ancient Greece,' said our tutor. I looked at him without an idea in my head, and again fixed my eyes on the poet. 'Ancient Greece,' whispered my companions, 'lay in Europe between the thirty-seventh and forty-first degrees of northern latitude.' 'I know,' said I, quietly; and still kept my eyes on Derzhavin. The tutor, out of all patience, called up the next pupil, and I stood on one side, nearer Derzhavin than before. The director, who knew me from previous examinations, told him something about me, and Derzhavin, turning to me with an air of kindness, said, 'What is this?' pointing to a roll of paper I held in my hand. 'It is my works,' I replied, with the undisguised vanity of youth, and handed them to him. He opened the roll, read a few verses (I remember they were very bad), and said, returning them, 'This is very good: go on.' Imagine my rapture! Derzhavin had spoken to me—Derzhavin had read my verses—Derzhavin had praised them! There are rapid moments which influence the fortunes, the deeds of the whole after life. The few words of Derzhavin had a magic effect on me; it seemed to me that he, the high priest of Russian literature, had opened to me the entrance to its mysteries, and that duty commanded me to follow the call." It is noticeable, as this was his chief encouragement to a literary career, that in the subsequent collection of his 'Works,' not a line of verse is to be found. He commenced as a contributor to periodicals, and with some small separate publications, which acquired him a reputation that led Uvarov, Olenin, and some other official personages—when in the great crisis of 1812 it was thought desirable to establish a new patriotic periodical—to invite him to become the editor. They were at a loss for a title, and just at that time Grech happened to receive a letter from his brother, a

military officer, who died soon after of his wounds at the battle of Borodino, concluding with the words, "I shall die a true 'Suin Otechestva' ('son of the country,' or, more literally, 'son of the fatherland')." These words were adopted at once, and the 'Suin Otechostva' began to appear about the time that the enemy entered Moscow. The contents consisted of patriotic sermons, poetry and declamation, and, above all, of news from the seat of war. Its success was great; and when, after the conclusion of the war, the editor began to give it a literary turn, it continued successful, and was for some time the leading Russian magazine. The articles of criticism on current literature by Grech had considerable influence, and were remarkable for the neatness and finish of their style. By successive enlargements it became the prototype and progenitor of the present gigantic periodicals of Russia, the most voluminous in Europe, each monthly or fortnightly number of which often contains from 300 to 400 closely-printed octavo pages. Grech ceased himself to have any connection with it in 1839, and a few years after it came to a standstill, though we believe it has since revived. One periodical seems to have led to another. In 1825 he established with Bulgarin [BULGARIN] the newspaper entitled 'Syvernaya Pchela' ('The Northern Bee'), with which he appears to be still connected. In 1834, while editing the 'Suin Otechestva,' he was unanimously chosen by a meeting of Russian literary men, who proposed to found another magazine, the editor of the 'Biblioteka olya Chteniya,' or 'Circulating Library,' which soon passed into the hands of Senkovsky, and still continues one of the leading periodicals of St. Petersburg. He also set on foot, in 1835, the 'Entsiklopedichesky Lexikon,' or great Russian cyclopædia; but this proved an exception to the usual good fortune of his undertakings. He relinquished the editorship before the end of the seventh volume, and the publication came to a final close with the fourteenth, though supported by the patronage of the emperor. It was probably conceived on too gigantic a scale, the fourteen volumes which were issued not carrying it beyond the third letter of the Russian alphabet, which contains more than thirty. The 'Military Cyclopædia,' commenced in 1836 by himself and the Baron von Zedeler, was brought to a successful conclusion, and is a great store-house of information with regard to Russian military matters and the biography of Russian soldiers.

These great undertakings were far from absorbing the whole of his activity. In 1822 he published a 'History of Russian Literature,' which has formed the ground-work for all that has since been written on the subject. The plan is very convenient—a general view is first taken of the course, tendencies, and leading events of each literary period, and a short biography is then given of the principal authors, with a list of their works. These biographies are so brief, and in many cases so dry, that the work cannot be styled an entertaining one, but if the same plan had been executed on a larger scale—in three or four volumes instead of one—the work might have been made as attractive as it is serviceable. With the exception of the 'Biographies of Ecclesiastical and Secular Authors,' by Eugene Bolkhovitinov, it is almost the only work in Russian literature which supplies precise and accessible information on points of its literary history. It is singular that both of these authors have been the victims of the most unblushing plagiarism on the part of Germans. A work bearing the name of 'Gelehrtes Russland,' by Strahl, is merely a reproduction of one of those by Bolkhovitinov, and a certain Dr. Otto issued a 'History of Russian Literature,' in which nine-tenths of his statements were pillaged from Grech. The book was unfortunately rendered into English by a translator who knew little of German and nothing of Russian, and the English reader is to this day presented with a garbled and mangled version of Grech, at second hand, under the title of 'Coxe's Translation of Otto.' In 1827 appeared two of three grammars of the Russian language written by Grech—one a detailed and the other a practical one, which were followed in 1830 by an abridged grammar, which has become for Russia almost what Lindley Murray has been for England.

A great change in the Russian language was effected by Karamzin, and that change was first presented in a methodised form by Grech, who had Karamzin's occasional advice and assistance. The grammar of Vostokov, which has since followed, may be more learned and more elaborate, but Grech's seems likely to retain the pre-eminence as a grammar for practical purposes, the more so perhaps that the author was not deeply skilled in the other Slavonic languages, being, as we find in his travels through the Bohemian Desert, entirely unacquainted with Bohemian. The detailed grammar has been translated into French by Reiff, and it is still generally considered the standard grammar of Russian. Grech's other works are of less importance. Of his two novels, the 'Trip to Germany,' which is light and humorous, is considered more successful than the 'Black Woman,' which is mysterious and sentimental. He has also published some amusing light reading in the shape of narratives of travels—one of a visit in 1817 to France and Germany; another of a visit to those countries and England in 1838. As he stopped less than a fortnight in London, and was unable to speak English with fluency, his observations on England are not very profound, but they are in general good-humoured. Of the history of English literature he is so uninformed that he compassionates Sir Walter Scott for having received only forty pounds for his 'Waverley.' Two of his works are in defense of Russia from foreign

censures; one in reply to the Marquis de Custine's 'Travels;' another to König's 'Litterarische Bilder aus Russland;' the latter, though it contains some valuable facts, is very feeble in style, and it may be remarked that Grech's writings are in general very unequal, probably owing to their multiplicity. The whole of his works are full of a spirit of attachment to Russian institutions, not very enlarged, nor of course very enlightened, but not of a vehement or repulsive kind. In 1830 he was named Councillor of State, a nominal title intended to show that the government appreciated his services. His position as an influential critic naturally brought him in contact with many of the literary notabilities of St. Petersburg, and he boasts in his answer to König of having enjoyed the friendship of Karamzin, Dmitriar, Batyushkov, Zhukovsky, and latterly of Pushkin; but his closest union was with Bulgarin, from whose biography of his friend, prefixed to the fifth volume of a collection of Grech's miscellaneous works, published about 1837, most of the dates in this article are taken. One of Grech's sons assists him in his literary undertakings.

GREEN, VALENTINE, a celebrated English mezzotint engraver, was born in Warwickshire in 1739. After serving a short time with a line engraver at Worcester, he came to London in 1765, and turned his attention to engraving in mezzotint. He acquired a great reputation by his many prints after West, especially two large plates published a few years after his arrival in London, of the 'Return of Regulus to Carthage,' and 'Hannibal swearing eternal enmity to the Romans,' two of West's most celebrated pictures now at Hampton Court, and originally painted for George III. The 'Stoning of St. Stephen' after West is one of Green's masterpieces. He engraved also many of the pictures of the Düsseldorf Gallery, for which he was granted an exclusive privilege by the Elector of Bavaria in 1789, who afterwards conferred on him the title of Hof Kupferstecher (court engraver). He executed also several great plates after Rubens, including the 'Descent from the Cross' at Antwerp, and other masterpieces. In all he engraved upwards of 300 plates. He was elected an associate engraver of the Royal Academy in 1774. He died in 1813, aged seventy-four.

GREENE, MAURICE, Mus. Doc., who as a composer of English Church music is second to none, and indeed has scarcely a rival, was the son of the vicar of St. Olave Jewry, London, and born at the latter end of the 17th century. He received his education in St. Paul's choir, under Brind, the organist, from whose instructions, aided by his own strong genius and remarkable industry, he profited so well that he was elected organist of St. Dunstan's in the West before he had completed his twentieth year. In 1718 he succeeded his master in the important situation of organist to St. Paul's cathedral. On the death of Dr. Croft, in 1726, he was appointed organist and composer to the Chapel Royal; and in 1736 was presented to the office of Master of his Majesty's Band, on the decease of Eccles, a name familiar to all who are acquainted with the dramatic history of this country during the conclusion of the 17th and the beginning of the 18th century. Previous to the latter promotion, the degree of Doctor in Music was conferred on him at Cambridge, his exercise for which was Pope's 'Ode on St. Cecilia's Day,' the author having, at the request of Greene, made considerable alterations in his poem, and added a new stanza, which however forms no part of the ode in any edition of the poet's works. The university shortly after elected the composer professor of music, on the death of Dr. Tudway.

Dr. Greene took an active part in all musical affairs, and when Handel finally settled in this country, the English musician courted his acquaintance assiduously; but having taken some offence, he soon became one of the great master's bitterest enemies. He supported Bononcini (the same person who is immortalised in Swift's epigram), who was enabled, through the influence of Henrietta, duchess of Marlborough, and a strong party of the nobility, to get elevated to the rank of one of Handel's ephemeral rivals. Greene introduced him at the Academy of Ancient Music, where the Italian practised a deception which caused his expulsion, on which Greene retired, and established another concert at the Devil Tavern. Greene's enmity to Handel is said to have arisen from some contemptuous expressions which the great German uttered respecting Greene's compositions. His sarcasms were perhaps directed at Greene's lighter works; of his church music he could never have thought contemptuously.

In 1750 Dr. Greene came into possession of a good estate in Essex, left him by his paternal uncle, a serjeant-at-law. He then resolved to digest and publish a collection of the best English cathedral music, and in five years made considerable progress in his favourite undertaking; but his health beginning to fail, he delivered his materials to the care of his friend and disciple Dr. Boyce, who completed the work, and gave to the world the matchless volumes so well known to every real amateur of classical English music. Dr. Greene died in 1755, leaving one daughter, married to Dr. Michael Feating, rector of Wyke-Regis, Dorsetshire. He was, as Dr. Burney, who knew him, informs us, in figure "much below the common size, and had the misfortune to be deformed; but his address and exterior manners were those of a man of the world, mild, attentive, and well-bred." He enjoyed the friendship of Bishop Hoadley, at whose table he was always a welcome guest; and his interest with the Duke of Newcastle, of political memory, was strong. Among his compositions are some charming

cantatas and songs; but his fame is built on his 'Forty Anthems for one, two, three, four, five, six, seven, and eight voices,' in two folio volumes. "These," says a writer in 'The Harmonicon,' "place him at the head of the list of English ecclesiastical composers, for they combine the science and vigour of our earlier writers with the melody of the best Italian masters who flourished in the first half of the 18th century." To Greene our cathedral establishments owe a great debt of gratitude; his works constitute a very large portion of their musical wealth; and as the harmony heard in those venerable edifices attracts numbers to them, Dr. Greene, as well as some few other composers for our church, ought perhaps in strict justice to be ranked not only as skilful musicians, but among the promoters of the national religion.

GREENE, ROBERT, was a native of Ipswich. The date of his birth was probably a few years later than the middle of the 16th century. He was educated at St. John's College, Cambridge, where, in 1578, he took his Bachelor's degree, and his Master's in 1583; and he was incorporated at Oxford in 1588. Between 1578 and 1583 he travelled on the Continent, visiting Italy and Spain; and it has been asserted, on the evidence of concurring probabilities, that at some time or other in the early part of his life he took holy orders; but his academical degrees are almost the only facts in his history that can be ascertained with exactness. From about 1584 he was a frequent writer for the press and for the stage; and from some of his pamphlets, which make a half-poetical kind of confessions not unlike those of Byron, a few particulars of his melancholy career may be doubtfully gathered. It thus appears that he married the daughter of a gentleman in Lincolnshire, but that after she had borne a child to him he abandoned her for a mistress; and his subsequent life seems to have been spent in alternate fits of reckless debauchery and of the distresses and remorse which his excesses caused. In August 1592 a surfeit at a tavern in London threw him into an illness, which proved fatal. He was then in a state of abject poverty; and in a letter which he wrote to his wife the day before his death, charging her to pay a debt of ten pounds owing by him to his host, a poor shoemaker near Dowgate, he declared that if this man and his wife had not succoured him he must have died in the street. His death-bed was attended by the shoemaker's wife, and by another woman who was the sister of a hanged malefactor, and by whom he had had a son. He expired on the 3rd of September 1592; next day he was buried in the new churchyard near Bedlam.

The name of this unhappy man is very important in the early history of the English drama. Marlowe was the most distinguished of those poets who took the great steps which heralded the rise of Shakspeare. Greene and Peele held the second rank among the precursors of the golden age of our dramatic poetry. Greene nowhere exhibits either the glowing passion or the overflowing imagination of Marlowe, and his works are not only unequal, but in all respects irregular and anomalous; yet they show much sweetness of fancy, many touches of nature in incident as well as in character, and a poetic spirit which, if not lofty, is far above the range of the prosaic or ordinary. He was a man of decided genius, and his plays are valuable monuments of this interesting period in dramatic history. None of them were printed till after his death. Five have come down to us that are certainly his: 'The History of Orlando Furioso,' 1594, 1599, an eccentric but imaginative and not uninteresting performance; 'A Looking-Glass for London and England,' 1594, 1598, 1602, 1617, written by Greene and Thomas Lodge jointly, a dramatic version of the prophecy of Jonah against Nineveh, and amidst its whimsicalities, the most dramatic of Greene's works; 'The Honourable History of Friar Bacon and Friar Bungay,' 1591, 1599, 1630, 1655, a legendary play, natural and poetical, and on the whole the most pleasing of the series; 'The Comical History of Alphonsus, King of Aragon,' 1599, a group of heroic pictures, in which the poet emulates with tolerable success, the swelling vein of Marlowe; 'The Scottish History of James the Fourth,' 1598, a most extravagant yet not unpoetical invention, having nothing of history in it but the names. There has been attributed to Greene, upon very doubtful evidence, the lively drama of 'George a-Greene, the Pinner of Wakefield,' printed in 1599. It has likewise been asserted that he wrote, or had a share in writing, one or both of the plays which are the groundwork of 'Henry VI.,' parts ii. and iii. The opposite and sounder opinion is maintained, and the state of the controversy set forth, in Mr. Knight's editions of Shakspeare. ('Essay on Henry VI. and Richard III.')

'George a-Greene' is in all the editions of Dodsley's Old Plays: 'Friar Bacon' is in Mr. Collier's edition of that collection. Two excellent editions of Greene's dramatic works, with all his other compositions in verse, have been published by Mr. Dyce, 2 vols. 12mo, first printed in 1831. In these volumes Mr. Dyce has given a full account of Greene's life, with copious specimens of his prose works, and a list of them which is complete, or almost so. The list embraces thirty-four pieces, which are undoubtedly his. Their matter is very various. In his gayer hours he wrote love-stories and other novels, sketches of society, chiefly in its disreputable walks, and miscellaneous essays; in his moments of remorse he wrote warnings to debauched youth, and ample but exaggerated and romantic confessions of his own follies. Pieces of this last class are the following:—'Greene's Never Too Late; or, a Powder of Experience sent to all Youthful Gentle-

men to root out Infectious Follicle,' 1590; 'Greene's Mourning Garment, given him by Repentance at the Funerals of Love,' 1590; and 'Greene's Groatworth of Wit, bought with a Million of Repentance,' 1592, which was published soon after his death by his friend and fellow-labourer Henry Chettle, and has been reprinted by Sir Egerton Brydges, 1813. One of his novels, 'Pandosto, the Triumph of Time,' otherwise called 'The Historie of Dorastus and Fawnia,' is the original of 'The Winter's Tale.' It was first printed in 1588, had reached a twelfth edition in 1735, and is reprinted by Mr. Collier in his 'Shakspeare's Library,' 1840. Some other tracts of Greene will be found in the 'Archaica' and 'Harleian Miscellany.' All the prose works are interspersed with pieces in verse, which are by far the best parts of them. The style is their weak point; it is deformed by a close copying of Lilly's worst affectations; and although, when we examine the matter, we often discover picturesque descriptions, and sometimes touching passages of narrative, yet nowhere in the tedious and perplexed mass do we find any reason for saying more of Greene's prose compositions than that they are indifferent works written by a man of genius.

GREENOUGH, HORATIO, American sculptor, was born in Boston, United States, September 6th 1805. From his earliest childhood he showed a great facility in drawing and modelling, and his tastes were carefully cultured; but it was not till he had completed the ordinary collegiate training that he began seriously to contemplate the adoption of sculpture as a profession. Sculpture had then few practitioners in America, and none of any mark; Greenough therefore proceeded to Rome in order to study the art. Rome continued to be his residence for some years, and he derived much professional advantage from the friendly services of Thorwaldsen. His health however gave way, but it was speedily restored by a visit to his native land. There however he did not stay long. On his return to Europe he remained long enough in Paris to execute a clever bust of Lafayette, and then proceeded to Florence, where he fitted up a studio, and where, during a residence of several years, his principal works were executed. Of these the most important perhaps are his colossal statue of Washington, which now stands in the grounds of the Capitol at Washington; and the 'Rescue,' or, as it is sometimes termed, the 'Pioneer's Struggle,' now in the Capitol itself: both of these works were commissioned by Congress. The 'Rescue,' a work of considerable originality and power, is intended to typify the struggle between the native and European races, and consists of a group of a pioneer rescuing his wife and child from an Indian. Besides these he executed several portrait-statues and monumental groups, numerous busts, and some very pleasing and graceful poetic figures and busts. He returned to America in 1851 to superintend the erection of his group of the 'Rescue,' and eventually determined not again to return to Europe. But he had become inured to an Italian climate, and his constitution proved unable to withstand the variations of an American one. After a severe illness he died, December 18th 1852.

Greenough will probably not ultimately rank among the foremost modern sculptors, but he occupies, and will no doubt continue to occupy, a very respectable position; while he will always retain a prominent place in the history of American art as the first of his countrymen who obtained a European reputation as a sculptor. Greenough's attainments were not limited to sculpture: he painted with some skill, and he wrote well both in verse and prose. In private life, while thoroughly unassuming, few men have been more esteemed.

GREGAN, JOHN EDGAR, architect, claims notice as one of those who have contributed by their works to the architectural improvement of the city of Manchester, where great progress in art has been manifested during the last twenty years. Gregan was born in 1813 in Scotland; it is believed at Dumfries. He received an excellent general education at Edinburgh, and acquired his first professional knowledge of Mr. Walter Newall, architect, at Dumfries. About the year 1836 or 1837 he went to Manchester, where he was for some time an assistant to Mr. T. W. Atkinson, an architect who may be said to have commenced the improvement which has been referred to. Mr. Atkinson left Manchester in the year 1840, when Gregan commenced practice on his own account, and wholly by merit and exertion raised himself into a prominent position. His works include several churches and schools in the neighbourhoods of Manchester, Bolton, and Preston, and the chapel of the Diocesan Training School at Chester,—these being in the mediæval styles; the church of St. John at Miles-Platting, and the Presbyterian churches at Green-Heys and Ancoats, schools to the latter, and the Jews' School at Cheetham Hill—all in the style of Northern Italy; several private houses at Manchester and neighbouring towns; warehouses (the class of buildings through which the chief architectural character of Manchester is expressed); the lodges to the public parks of the same city, and other buildings. His best work however, and it is of great merit, is the bank of Sir Benjamin Heywood, Bart., and Co., of which an illustrated account may be found in the 'Builder' (vol. vii.), where also is a view, or an elevation, of one of his warehouses (vol. viii.). The bank is designed in an adaptation of the Venetian Italian style,—with careful attention to beauty of detail. The new Mechanics' Institution at Manchester, from his designs, has been mainly carried out under Mr. Corson's superintendence, since the death of the original designer. Gregan died suddenly, after a short illness

brought on by over-exertion, on the 29th of April 1855. He was a Fellow of the Institute of British Architects, Honorary Secretary to the Manchester Royal Institution, and took great interest in the local School of Design, the establishment of the Free Library, and other institutions. He possessed a cultivated taste in general art, was ready with pencil and brush, and was a skilful performer on one or two musical instruments.

GREGORIO, ROSARIO, born in 1753, studied at Palermo, became a priest, and was made a canon of the cathedral of that city. He made himself known by his historical and antiquarian learning, which he applied especially to illustrate the history of his native country. In 1789 he was appointed Professor of Law in the University of Palermo. He was one of the first to suspect the imposture of the Maltese adventurer Vella, who had forged a pretended Arabic diplomatic code of the period of the Saracenic dominion in Sicily, and had succeeded in deceiving some men of learning, among others the Prelate Airoldi, who for a time patronised him. Gregorio having a strong suspicion of the imposture, applied himself to the study of Arabic, in order to be able to sift the whole matter; and the result was that he became convinced, and convinced others, of Vella's fraud, which was afterwards clearly exposed by the learned Hager, of Vienna, in a journey which he made to Sicily in 1794. An account of this curious controversy is found in the 'Fundgruben des Orients.' In 1790 Gregorio published a collection of Arabic historical works and documents concerning the history of Sicily, 'Rerum Arabicarum quæ ad Historiam Siculam spectant ampla Collectio,' 1 vol. folio, which he dedicated to King Ferdinand. It contains, 1, Novari's 'History of Sicily'; 2, an anonymous 'Chronicle of Sicily,' from a manuscript in the Library of the University of Cambridge; 3, Sheaboddin's 'History of Sicily'; 4, 'Extracts from Abulfeda's Annals which relate to the History of Sicily'; 5, Al Khatib's 'Chronological Series of the Dynasties of the Aglabides and Fatimites who ruled over Sicily'; 6, 'Historical Parallels of the Rulers of Sicily during the Saracenic Period'; 7, 'A Description of Sicily from Edrisi's Geography'; 8, 'Illustrations of several Inscriptions in the Cufic Character found in Sicily'; 9, 'A Dissertation on the Calendar used in Sicily under the Arabs'; 10, 'A Sketch of the Geography of Sicily during the same period'; 11, 'Biographical Notices of Arabian Writers, natives of Sicily.' The Arabic text of the original historical works and documents is given with a Latin version, to which are appended copious notes by Gregorio. Some of the historical works had been previously published by Caruso in his 'Bibliotheca Historica Regni Siciliae,' but in a very imperfect and incorrect state, owing to Caruso's want of knowledge of Arabic. Having thus illustrated the Saracenic period, Gregorio undertook to illustrate also that of the Aragonese dynasty in Sicily, thus affording a continuation to Caruso's work above quoted, which extended through the Norman and Suabian periods, 'Bibliotheca Scriptorum qui Res in Sicilia gestas sub Aragonum Imperio retulerunt. Eam uti Accessionem ad Historicam Bibliothecam Carusii instruit, adornavit, atque edidit Rosarius Gregorio, S. Panormitanæ Ecclesiæ Canonice et Regius Juris publici Siculi Professor,' 2 vols. folio, 1791-92. This collection contains the 'Historia Sicula' of B. de Neocastro; an anonymous account of the famous conspiracy of Procida, written in the vernacular Sicilian dialect; a narration, likewise in the Sicilian dialect, of the arrival at Catania of King Jayme of Aragon; the 'Historia Sicula ab a. 1282 ad 1337' of Speciale, and its continuation to the year 1361 by Michael Platensis, an anonymous history of Sicily from 1337 to 1412, written in Sicilian; the chronicle of Simone di Lentini, and other chronicles; besides an ample collection of diplomatic documents of the Aragonese period, illustrating the laws and customs of that age. In 1794 Gregorio published his 'Introduzione allo Studio del Dritto Pubblico Siciliano,' in which he examines the sources of the law of Sicily, the various constitutions of the Normans, Suabians, and Aragonese, the 'consuetudines' of Sicily, and the proper method for studying and expounding the same. In 1806 he published the first volume of his 'Considerazioni sulla Storia di Sicilia dai Tempi Normanni sino ai presenti,' a work which was afterwards extended to six volumes, the last two being published after the author's death, and which supplies an excellent commentary on the history of Sicily. He also wrote 'Discorsi intorno alla Storia di Sicilia,' which have been likewise published after his death, and in which he discards the fabulous stories of those who claimed for Sicily a remote civilisation and literature of Phœnician or Asiatic origin, anterior to Greek colonisation. Gregorio assumed to prove that the earliest colonies in Sicily came from the west, and not from the east—from Iberia, Liguria, and Latium, and not from Syria.

Gregorio filled several offices under the government. He was made revisore or book-censor, judge of the ecclesiastical court, and Regio Economico Ecclesiastico, or auditor of church property; but his emoluments continued to be scanty until a short time before his death, when he was presented to the abbacy of Santa Maria di Roccadia. He died in 1809. He is one of the writers who have done most for elucidating the history of Sicily: he was one of those single-minded studious men who are to be met here and there amidst the vortex of Neapolitan and Sicilian dissipation and sensuality, and who live as it were in a world of their own, retaining a kind of primitive simplicity which contrasts strangely with everything around them.

(Scinà, *Prospetto della Storia letteraria di Sicilia nel Secolo XVIII.*, Palermo, 1824-27.)

GREGORIUS (PARDUS) OF CORINTH, an archbishop of Corinth in the 12th century, is chiefly known by a work on dialects (*Ἐπι διαλέκτων*), the latest edition of which is by Gf. H. Schäfer, Leipzig, 1811, 8vo.

GREGORIUS OF NAZIANZUS, one of the fathers of the church, was born in the early part of the fourth century, at Arianzus, a village near the town of Nazianzus in Cappadocia, of which town his father was bishop. He studied first at Cæsarea in Cappadocia, afterwards at Alexandria, and lastly at Athens, where he became the friend and companion of Basilus, and where he also met Julian, afterwards emperor. At a subsequent period he joined Basilus, who had retired to a solitude in Pontus during the reign of Julian. [BASIL.] When Basilus was made archbishop of Cæsarea, he appointed his friend bishop of Zazime, a place of which Gregorius gives a dismal account, and which he soon after left to join his father, and assist him in the administration of the church of Nazianzus. He there made himself known for his eloquence in the orations which he addressed to his father's flock. These compositions are remarkable for a certain poetical turn of imagery, and for their mild persuasive tone. Above all things he preaches peace and conciliation; peace to the clergy agitated by the spirit of controversy; peace to the people of Nazianzus distracted by sedition; peace to the Imperial governor who had come to chastise the town, and whose wrath he endeavours to disarm by appealing to the God of mercy. In an age of sectarian intolerance he showed himself tolerant. He had suffered with his brethren from Arian persecution under the reign of Valens; and after that emperor had taken by violence all the churches of Constantinople from the orthodox, or Nicæans, the inhabitants, who had remained attached to that faith, looking about for a man of superior merit and of tried courage to be their bishop, applied to Gregorius, who had left Nazianzus after his father's death and had retired into Isauria. Gregorius came to Constantinople and took the direction of a private chapel, which he named Anastasia, and whither his eloquence soon attracted a numerous congregation, to the great mortification of the Arians. Theodosius having assumed the reins of government, and triumphed over his enemies, declared himself in favour of the orthodox communion, retook the churches which the Arians had seized, and came himself with soldiers to drive them from Santa Sophia, an act which Gregorius says looked like the taking of a citadel by storm. Gregorius being now recognised as metropolitan, did not retaliate upon the Arians for their past persecutions, but endeavoured to reclaim them by mildness and persuasion. In the midst of the pomp of the imperial court he retained his former habits of simplicity and frugality. His conduct soon drew upon him the dislike of the courtiers and of the fanatical zealots. Theodosius convoked a council of all the bishops of the East to regulate matters concerning the vacant or disputed sees which had been for many years in possession of the Arians. The council at first acknowledged Gregorius as archbishop, but soon after factions arose within the assembly, which disputed his title to the see, and stigmatised his charity towards the now persecuted Arians as lukewarmness in the faith. Gregorius, averse to strife, offered his resignation, which the emperor readily accepted. Having assembled the people and the fathers of the council to the number of 150, in the church of St. Sophia, he delivered his farewell sermon, which is a fine specimen of pulpit eloquence. After recapitulating the tenour of his past life, his trials, the proofs of attachment he had given to the orthodox faith in the midst of dangers and persecution, he replies to the charge of not having avenged that persecution upon those who were now persecuted in their turn, by observing that to forego the opportunity of revenging ourselves upon a fallen enemy is the greatest of all triumphs. He then pleads guilty to the charge of not keeping up the splendour of his office by a luxurious table and a magnificent retinue, saying that he was not aware that the ministers of the sanctuary were to vie in pomp with the consuls and commanders of armies. After rebuking the ambition and rivalry of his colleagues, which he compares to the factions of the circus, he terminates by taking an affectionate leave of all those around him, and of the places dear to his memory. This valedictory address is a touching specimen of the pathetic style, dignified and unmixt with querulousness. The orator salutes for the last time the splendid temple in which he is speaking, and then turns towards his humble but beloved chapel of Anastasia, to the choir of virgins and matrons, of widows and orphans, so often gathered there to hear his voice; and he mentions the short-hand writers who used to note down his words. He next bids "farewell to kings and their palaces, and to the courtiers and servants of kings, faithful, I trust, to your master, but for the most part faithless towards God; farewell to the sovereign city, the friend of Christ, but yet open to correction and repentance; farewell to the Eastern and Western world, for whose sake I have striven, and for whose sake I am now slighted." He concludes with recommending his flock to the guardian angels of peace, in hopes of hearing from the place of his retirement that it is daily growing in wisdom and virtue. (S. Gregorii Nazianzeni, Opera, Billy's edition, 'Oratio' xxiii.)

This oration was delivered in June 381, and a few days after Gregorius was on his way to his native Cappadocia. Arrived at Cæsarea he delivered an impressive funeral oration to the memory of his friend Basilus, who had died there some time before, in which he recalls to mind their juvenile studies at Athens, their long intimacy, and the events of their chequered lives ('Oratio' xx, in Billy's edition).

After paying this last tribute to the memory of his friend he withdrew to his native Arianzus, where he spent the latter years of his life, far from the turmoil of courts and councils, busy in the cultivation of his garden and in writing poetry, a favourite occupation with him from his youth. Gregorius died in 389. Most of his poems are religious meditations. Occasionally the poet attempts to dive into the mysterious destiny of man, and sometimes appears lost in uncertainty and doubt as to the object of human existence, but he recovers himself to do homage to the Almighty wisdom whose secrets will become revealed in another sphere. The adept in the philosophy of ancient Greece is here seen striving with the submissive Christian convert. St. Jerome and Suidas say that Gregorius wrote no less than 30,000 lines of poetry. Part of his poems were published in the edition of his works by the Abbé de Billy, Paris, 1609-11, which contains also his orations and epistles; twenty more poems, under the title of 'Carmina Cygnea,' were afterwards published by J. Tollius in his 'Insignia Itinerarii Italici,' 4to, Utrecht, 1696, and Muratori discovered, and published in his 'Anecdota Græca,' Padua, 1709, a number of Gregorius's epigrams. Of his orations some few turn upon dogmas, especially on that of the Trinity, but most of them are upon morality. He is a soberer writer than his successor Chrysostom, and has more of the calm impressive eloquence of conviction. He and his friend Basilus brought the oratorical arts of ancient Greece into the service of Christian preaching, and one of Gregory's greatest complaints against Julian is that that emperor had forbidden Christians the study of Greek literature. In his two orations against Julian, he somewhat departs from his usual style, and assumes that of a powerful invective in reply to the panegyrics of Libanius, Eunapius, and other admirers of that emperor. Gregorius of Nazianzus has been styled the 'Theologian of the Eastern Church;' he might with as much truth be styled its most poetical writer. (Suidas v. Gregorius; Gregorii, Opera.) There are several lives of Gregorius; one of which is prefixed to the handsome edition of his 'Orations' by the Benedictines of St. Maur, 2 vols. folio, Paris, 1778. The Abbé de Bellegarde published a French translation of Gregorius's 'Orations,' 2 vols 8vo, Paris, 1693.)

GREGORIUS, BISHOP OF NYSSA, the younger brother of Basilus the Great, was born at Cæsarea, in Cappadocia, about the year 331. As an earnest supporter of orthodox opinions, he was bitterly assailed by the Arians. In 375 he was driven into banishment, but on the death of Valens, he was recalled by Gratian in 378. He was sent on a mission to inspect the churches of Arabia, by the synod of Antioch, and he attended and took an active part in the first and second oecumenical councils of Constantinople in 381 and 394. He died about 396. He distinguished himself in the Arian controversy, and wrote besides several Sermons, Orations, Letters, and Biographies. A complete edition of his works was published by Morell and Gretzer, 2 vols. folio, Paris, 1615-18, reprinted in 1638.

GREGORIUS, called **THAUMATURGUS**, a native, and afterwards bishop of Neo-Cæsarea, in Cappadocia, and a disciple of Origen. We have by him a 'Metaphrasis in Ecclesiastem,' a 'Brevis Expositio Fidei,' an 'Epistola Canonica,' and a panegyric oration to his master Origen, on leaving his school; to which the latter replied by an interesting letter, which is printed in his works. He was compelled, by the Decian persecution, to conceal himself in the wilderness. He appears to have died soon after the Council of Antioch, which he attended A.D. 264. Numerous miracles are ascribed to him by his early and mediæval biographers—whence his surname. He is otherwise known as St. Theodorus.

GREGORY OF TOURS, born in 544, of a family of Auvergne, was nephew to Gallus, bishop of Clermont, who took care of his education. He was made bishop of Tours in 573, attended several councils, and distinguished himself by his courage and firmness in denouncing the guilty conduct of Chilperic and Fredegonda, who reigned over France. His boldness exposed him to a sort of persecution, and he retired to Rome, where he died in the year 595. He wrote in Latin a history of France from the first establishment of Christianity till the year of his death. Gregory is the father of the French historians, and the only one who has left us an account of the early Merovingian kings. He is evidently sincere, but very credulous; he is often ungrammatical and rude in his style and expressions, and he neglects dates. He spares not his enemies: Chilperic he calls the Nero of his age, and speaks in no milder terms of his queen Fredegonda. The best edition of Gregory's history is that of Paris, 1699, fol. He also wrote a legendary account of the virtues and miracles of saints, and other works of a similar nature, a notice of which is given in Rivet's 'Histoire Littéraire de la France,' vol. iii.

GREGORY I. (POPE), styled the Great, was born about 550, of a noble Roman family. He distinguished himself for his learning, and was made prefect of Rome in 573. His ascetic turn of mind made him give up that office and retire to a monastery, from which he was recalled by Pope Pelagius II., who sent him on an embassy to Constantinople to request assistance against the Longobards. On his return to Rome, after the death of Pelagius, in 590, the clergy and people elected him as his successor. Gregory earnestly wished to decline that dignity; he wrote to the emperor Maurice entreating him not to confirm his election, and he even concealed himself; but all was in vain, and he was obliged at last to fill the pontifical chair. He showed great zeal for the reformation of the abuses and corruptions which had crept

into the church, as well as for the propagation of Christianity. He assisted Theodolinda, queen of the Longobards, in converting that people to the Catholic faith. He likewise sent missionaries into Sardinia, and zealously supported the mission to England, where the king of Kent and many of the Anglo-Saxons had embraced Christianity. It was previous to his exaltation to the pontifical chair, that seeing one day in the slave-market at Rome some Anglo-Saxon children exposed for sale, and being struck by their comely appearance, he is said to have exclaimed: "They would be indeed not Angli but Angeli, if they were Christians," and from that time he engaged his predecessor, Pelagius, to send missionaries to England. John the Abbot, archbishop of Constantinople, having assumed the title of Ecumenic, or Universal Patriarch, Gregory wrote to him in 595 to induce him to relinquish a title which gave offence to his brethren. "You know that the council of Chalcedon," says he in his letter, "offered the title of Ecumenic to the bishop of Rome, but that all my predecessors have refused an assumption full of pride and inconsistent with the ancient discipline." Gregory himself adopted the denomination of 'Servus Servorum Domini,' ('servant of the servants of the Lord,') meaning the bishops, an appellation which the popes have retained, ever since their assumption of universal supremacy. Gregory exercised the jurisdiction of primate of Italy, and gave advice to the other bishops, but not commands. He lived in the most frugal and simple style, although he had at his disposal the large wealth of the Roman see, which he distributed to the poor. He was averse from persecuting heretics and Jews: he considered mildness and persuasion as the only means to bring them to Christianity.

He has been reproached with having written to the usurper Phocas, who had murdered the emperor Mauritius and had seized on his crown, a letter in a flattering strain, apparently with a view of securing the protection of the Eastern Empire in favour of Rome, then threatened by the Longobards. Another charge against Gregory is, that he destroyed some classical manuscripts, the remains of the Imperial library at Rome; but this charge was made many centuries after, and does not seem to rest upon clear evidence. Gregory manifested however an aversion to the works of the heathen writers, especially those which treated of mythology, and forbade their perusal. He wrote numerous works, which have been collected and published by the Benedictines of St. Maur, 4 vols. fol., Paris, 1707. The most important are:—1 'Moralium, libri xxxiv.,' 2 'De Cura Sacerdotali,' being a pastoral instruction on the duties of the parochial clergy; 3, his 'Letters,' in 12 books, which contain some interesting particulars on contemporary history; 4, his 'Dialogues,' which contain many accounts of miracles, a matter on which Gregory shows himself rather credulous. Gregory died at Rome in 604, and was succeeded by Sabinianus of Volaterra.

GREGORY II., a native of Rome, succeeded Constantine in the see of Rome in 715, and was involved in disputes first with Luitprand, king of the Longobards, against whom he implored the assistance of Charles Martel; and afterwards with Leo Isaurus, on the subject of image-worship, which that emperor had proscribed. He convoked two councils, one against the Iconoclasts, and another to forbid marriage to persons who had once entered the monastic rule. It was under his pontificate that Boniface went to preach Christianity in Germany. Gregory died in 731.

GREGORY III., a native of Syria, succeeded Gregory II., and continued the controversy with Leo Isaurus concerning image-worship. He found himself likewise involved in a dispute with the Longobards, and died in 741. He was succeeded by Zacharias.

GREGORY IV., a native of Rome, succeeded Valentinus in 827. The coast near Rome being exposed to incursions from the Saracens of Sicily, Gregory undertook to build a new town near Ostia, to which he gave the name of Gregoriopolis. Pending the quarrel of Louis le-Debonnaire and his revolted sons, Gregory proceeded to France to conciliate matters; but he drew upon himself the dissatisfaction of both parties, and even of the French bishops. He died at Rome in 844. He was succeeded by Sergius II.

GREGORY V., a German of the name of Bruno, and a relative of Otho III., was elected pope through the influence of that emperor, in 997, after the death of John XV., whom some style XVI. Gregory crowned Otho at Rome as emperor and king of Italy. After Otho's departure, the patrician Crescentius, who had assumed the title of consul, excited the people against the new pope, and drove him out of the city. Crescentius seems to have aspired to govern Rome under a nominal allegiance to the Eastern emperors. He procured the election of an anti-pope in the person of John, bishop of Piacenza, who entered into his views; but in the following year Otho and Gregory returned with an army to Rome, imprisoned John, who was cruelly mutilated, and beheaded Crescentius, with twelve of his partisans. In the year after, February 999, Gregory died, and was succeeded by Sylvester II.

GREGORY VI., a native of Rome, succeeded Benedict IX. after his abdication, in 1044. He was disliked by the Romans, who, being accustomed to the licentiousness and anarchy which had prevailed under the disgraceful pontificate of Benedict, could ill bear the attempts of the new pope to enforce order. The emperor Henry III. assembled a council at Sutri, in 1046, which deposed all the three popes, Benedict, Sylvester III., and Gregory, and chose Clement II.

Gregory is said to have willingly resigned his claims, and to have retired to a monastery, where he ended his days.

GREGORY VII., Hildebrand of Soano, in Tuscany, was of low parentage, and became a monk in the convent of Cluny. Having acquired a reputation for theological and canonical learning, and for strict regularity of conduct, he afterwards went to Rome with Bruno, bishop of Toul, a relative of the emperor Henry III., who was elected pope in 1049, under the name of Leo IX., chiefly through Hildebrand's influence. From that time the monk Hildebrand became the main-spring of the Roman hierarchy, and the intimate councillor of Leo, and his successors, Victor II., Stephen IX., Nicholas II., and Alexander II. He was sent to Germany on a mission to the Imperial court by Stephen IX., and on his return he defeated the faction which had raised to the papal throne Benedict X., and secured the election of Nicholas II. After the death of Alexander II., in 1073, Hildebrand was unanimously elected his successor by the clergy and people of Rome, but he did not assume his title until he had received the approbation of the emperor Henry IV., to whom he despatched messengers for the purpose. The emperor, pleased with this act of deference, readily confirmed his election, and Hildebrand assumed the name of Gregory VII. The great object of Gregory's ambition was, as he expressed himself in a letter to Hughes, abbot of Cluny, to effect a total reform of the Church, which certainly stood in great need of it. Simony prevailed throughout the Christian world, and sees were openly sold or given by sovereigns to their favourites. The bishops raised by such means, caring little for their duties or their flocks, but much for their worldly advantage and pleasures, sold the benefices at their disposal. Gregory determined to remove the evil by taking away from the secular princes the right which they assumed of disposing of the sees within their dominions. The emperor Henry IV., licentious, ambitious, and at war with his revolted vassals, and therefore continually in want of money, was one of the most culpable in respect of simony. He disposed of sees and benefices in favour of vicious or incapable men, and the bishops of Germany readily entered into his views of making the Church a sort of feudal dependant on the Imperial will. Gregory began by admonishing Henry; he sent legates to Germany, but to little purpose. His next step was to assemble a council at Rome in 1074, which anathematised persons guilty of simony, and ordered the deposition of those priests who lived in concubinage, under which name however were also included those who lived in a state of matrimony, and it was decreed also that no one should be admitted to holy orders unless he made a vow of celibacy. This last regulation created great excitement, especially at Milan, where the custom of priests being married was still prevalent, as in the Eastern Church. Gregory summoned another council at Rome in 1075, in which for the first time kings and other lay princes were forbidden, under pain of excommunication, from giving the investiture of sees and abbeys by conferring the ring and the crosier. This was the beginning of the quarrel about the investiture which distracted Europe for many years after, and which may here require some explanation. In the early ages of the Christian Church, it would appear that the body of the clergy, or presbyters, of a town or district, together with the municipal council, or notables, elected their bishop, or chief pastor, and the Christian emperors did not interfere with the choice, except in the case of the great patriarchal sees, such as Rome and Constantinople, the candidate to which, after being elected by the clergy and people, was required to wait for the Imperial confirmation. The Gothic kings of Italy followed the same system, as well as the exarchs of Ravenna after them, in the name of the Byzantine emperors. At Rome, and probably in the rest of Italy also, the laity participated in the election of their bishops till the 10th century; in the east they appear to have been excluded from it sooner. Charlemagne is said by some to have introduced the custom of putting the ring and crosier into the hands of new-elected bishops, while he required from them the oath of fealty to himself. There seems no doubt at least that the custom was prevalent under his successors of the Carolingian dynasty. The reason of this was, that the churches having been richly endowed by various sovereigns with lands and other temporalities, the incumbents were considered in the light of feudal tenants. By thus keeping at their own disposal the temporalities of the sees, the sovereigns came gradually to appoint the bishops, either by direct nomination, or by recommending a candidate to the electors. Gregory making no distinction between spiritualities and temporalities, considered the investiture as a spiritual act, insisting that the crosier was emblematic of the spiritual authority of bishops over their flocks, and the ring was the symbol of their mystical marriage with the Church; although, Sarpi observes, in his 'Treatise upon Benefices,' there was another ceremony, namely, the consecration of the bishop elect by imposition of hands by the metropolitan, which was the real spiritual investiture. But Gregory's object was to take away from laymen all ecclesiastical patronage, and to make the Church, with all its temporalities, independent of the state. He would not admit of any symbols of allegiance to the state, and he contended that the estates of sees had become inseparably connected with the spiritual office, and could no longer be distinguished; and yet he himself had waited for the confirmation of the emperor before he was consecrated.

The emperor Henry IV. paid no regard to Gregory's councils and

their decrees, and he continued to nominate not only to German but also Italian bishoprics. Among others he appointed a certain Tedaldo archbishop of Milan, in opposition to Azzo, a mere youth, who had been consecrated by Gregory's legats. But the quarrel of the investiture, which had opened the breach between the pope and the emperor, was lost sight of in the more extraordinary discussions which followed between them. Gregory had been for some time tampering with Henry's disaffected vassals of Saxony, Thuringia, and other countries, and he now publicly summoned the emperor to Rome to vindicate himself from the charges preferred by his subjects against him. This was a further and most unwarrantable stretch of that temporal supremacy over kings and principalities which the see of Rome had already begun to assume. Henry, indignant at this assumption of power, assembled a diet of the empire at Worms, at which many bishops and abbots were present, and which upon various charges preferred against Gregory deposed him, and despatched a messenger to Rome to signify this decision to the Roman clergy, requesting them to send a mission to the emperor for a new pope. Upon this, Gregory, in a council assembled at the Lateran Palace in 1076, solemnly excommunicated Henry, and in the name of St. Peter, prince of the apostles, declared him *ipso facto* deposed from the thrones of Germany and Italy, and his subjects released from their oath of allegiance. Gregory, observes Platina, in his 'Lives of the Popes,' was the first who assumed the right of deposing the emperors, whose vassals he and his predecessors had been considered till then, and who had even exercised the power of deposing several popes for illegal election or abuse of their authority. This bold act of Gregory produced for a time the effect which he had calculated upon. Most of Henry's subjects, already ripe for rebellion, readily availed themselves of the papal sanction, and a diet was assembled to elect a new emperor. Henry however obtained a delay, and the matter being referred to the pope, he set off for Italy in the winter of 1077, and, passing the Alps of Susa, met Gregory at the castle of Canossa, near Reggio in Lombardy, which belonged to the Countess Mathilda, a great friend and supporter of the pope. Gregory would not see Henry at first, but insisted upon his laying aside all the insignia of royalty and appearing in the garb of a penitent, in a coarse woollen garment and barefooted. In this plight Henry remained for three days from morning till sunset in an outer court of the castle, in very severe weather. On the fourth day he was admitted into Gregory's presence, and on confessing his errors received absolution, but was not restored to his kingdom, the pope referring him to the general diet. Henry soon after resumed the insignia of royalty, and being supported by his Lombard vassals, and indignant at the humiliating scene of Canossa, recrossed the Alps, fought several battles in Germany, and at last defeated and mortally wounded Rudolf of Swabia, who had been elected emperor in his stead, and was supported by Gregory. Having now retrieved his affairs in Germany, he marched with an army into Italy in 1081 to avenge himself on the pope, whom he had again deposed in another diet, having appointed Guibert, archbishop of Ravenna, as his successor, under the name of Clement III. Gregory had meantime drawn to his party by timely concessions Robert Guiscard, the Norman conqueror of Apulia and Sicily, who however could not prevent Henry from advancing to the walls of Rome; but the city was well defended, and the summer heats obliged Henry to retrace his steps towards North Italy, where his soldiers ravaged the territories of the Countess Mathilda. He repeated the attempt against Rome in 1082, and again in 1083, but without success. It was finally agreed that a general council should decide the questions between the emperor and the pope. The council assembled at Rome in 1083, and Gregory did not again excommunicate the emperor, but negotiated with him without coming to any definitive result.

In the following year, 1084, Henry was invited by some ambassadors from the Roman people, who were dissatisfied with the pope, to enter the city, which he did on the 21st of March, and immediately took possession of the Lateran, the bridges, and other important positions. Gregory escaped into the castle of St. Angelo, and the antipope Guibert was publicly consecrated on Palm Sunday by several bishops. On the following Easter Sunday Henry IV. was crowned by him as emperor in St. Peter's church. After the ceremony Henry ascended the capitol and was publicly proclaimed, and acknowledged by the Romans with acclamations. Hearing however that Robert Guiscard was approaching to Rome with troops, he left the city and withdrew towards Tuscany. Robert came soon after with his Norman and Saracen soldiers, who under the pretence of delivering Gregory, who was still shut up in the castle of St. Angelo, plundered Rome and committed all kinds of atrocities. Gregory having come out of his stronghold, assembled another council, in which, for the fourth time, he excommunicated Henry and the antipope Guibert. When Robert left the city to return to his own dominions, the pope, not thinking himself safe in Rome, withdrew with him to Salerno, where, after consecrating a magnificent church built by Robert, he died in the following year, 1085. His last words were, "I have loved justice and hated iniquity, and therefore I die in exile:" and perhaps he believed what he said.

The character of Gregory VII. has not been justly estimated by the generality of historians. He was at the outset no doubt sincere in his wishes for ecclesiastical reform; but in pursuing his favourite and, to

a certain extent, legitimate object, he was led astray by the ambition of exalting his see over all the dignities and powers of the earth, spiritual as well as temporal. Not content with making, as far as in him lay, the church independent of the empire, and at the same time establishing the control of the papal authority over the princes of the earth, objects which he left to be completed by his successor [INNOCENT III.], Gregory determined to destroy the independence of the various national churches. His object was to raise the pope to supreme power over church and state throughout Christendom. By a constitution of his predecessor Alexander II., which he dictated, and which he afterwards confirmed, it was enacted for the first time that no bishop elect should exercise his functions until he had received his confirmation from the pope. The Roman see had already in the 9th century subverted the authority of the metropolitans, under pretence of affording protection to the bishops; but now it assumed the right of citing the bishops, without distinction, before its tribunal at Rome to receive its dictates, and Gregory obliged the metropolitans to attend in person to receive the pallium. The quarrel of Anselm, archbishop of Canterbury, with William Rufus, was owing to that monarch not choosing to let him go to Rome, whither he had been summoned. The practice of sending apostolic legates to different kingdoms as special commissioners of the pope, with discretionary power over the national hierarchy, originated also with Gregory, and completed the establishment of absolute monarchy in the church in lieu of its original popular or representative form. This doctrine of papal absolutism in matters of discipline was by prescription and usage so intermixed with the more essential doctrines of faith, that it came to be considered as a dogma itself, and has defied all the skill of subsequent theologians and statesmen to disentangle it from the rest, while at the same time it has probably been, though at a fearful cost, the means of preserving the unity of the Western, or Roman Church.

GREGORY VIII., Alberto di Mora, a native of Benevento, succeeded Urban III. in October 1187, and died in the following December, after having sent letters of exhortation to the Christian princes in favour of a new crusade. He was succeeded by Clement III. He must not be confounded with an antipope of the name of Bourdin, who assumed the name of Gregory VIII. in the schism against Gelasius II. in 1118, and who is not reckoned in the series of legitimate popes.

GREGORY IX., Cardinal Ugolino, bishop of Ostia, a native of Anagni, and a relative of Innocent III., whose haughty principles concerning the papal prerogative he inherited, succeeded Honorius III. in March 1227. He insisted on Frederick II. setting off on a crusade, and as the emperor delayed on the pretext of illness, the pope excommunicated him. Frederick however set off for Palestine, where he concluded a truce with the Sultan of Egypt, and then returned to Europe, where his dominions of Apulia had been invaded by the papal forces. After his landing he had an interview with Gregory, who relieved him from the excommunication, and Frederick afterwards assisted the pope against the people of Rome, who were in a state of insurrection, and had driven him from their city. Frederick afterwards discovering that the pope was tampering with the Lombard cities, who were at war with the emperor, came again to an open rupture with him; and on Palm Sunday of the year 1239 Gregory again excommunicated him, released his subjects from their allegiance, and preached a crusade against him. The emperor replied by a spirited manifesto in his own justification, which was written by his learned chancellor Pietro delle Vigne, and copies of it were sent to the various courts of Europe. The war continued during that and the following year in Italy between Frederick and his Ghibeline partisans on one side, and the Guelphs, with the pope at their head, on the other. Frederick took Benevento and threatened Rome, where he had many partisans. The pope having convoked a council in 1241, the emperor arrested all the prelates who were on their way to Rome by land, while his fleet, joined with his allies the Pisans, attacked and defeated a Genoese squadron, on board of which were many bishops and abbots from France and other parts, who were taken prisoners. In August of that year Gregory died, after a stormy pontificate of nearly fourteen years, and was succeeded by Celestine IV.

GREGORY X., Tebaldo Visconti, a native of Piacenza, succeeded Clement IV. in 1271, after an interregnum of nearly two years. He convoked a general council at Lyon in 1274, which was very numerously attended, and in which a reconciliation was effected with the Greek Church, which however was of short duration; several reforms were made in matters of discipline, and among others the mode of election of the popes by conclave was settled. Gregory endeavoured also to rouse the ardour of the Christian princes for a new crusade, but he failed. He died at Arezzo in January 1276.

GREGORY XI., Pierre Roger, a Frenchman, son of William count of Beaufort, succeeded Urban V. in 1370. He was a man of great learning, and esteemed for his personal character. At the time of his accession a papal court had been for nearly seventy years residing at Avignon, and Rome and the rest of central Italy were left a prey to faction and anarchy. Gregory resolved to transfer the papal see back to Rome, which he did in 1377, to the great satisfaction of the Italians. He fixed his residence in the Vatican palace; that of the Lateran, which was inhabited by the earlier popes, having become sadly deteriorated during the Avignon captivity, as the Italians styled the absence

of the popes from Rome. Gregory died in 1378, and was succeeded by Urban VI. His will, which is remarkable for the frankness of his sentiments, is found in D'Achery's 'Spicilegium.' Gregory was the first to condemn the doctrines of Wicliff.

GREGORY XII., Angelo Cornaro, a native of Venice, was elected after the death of Innocent VII., in November 1406, by a part of the cardinals assembled at Rome. The schism which had divided the Western Church ever since 1379, when two popes were elected by their respective factions, still continued, and Benedict, styled XIII., was now the rival pope. [BENEDICT, ANTIPOPE.] The various princes of Europe sought to put an end to this state of things, and a council assembled at Pisa in 1409, deposed both Gregory and Benedict, and chose Peter Philargi, a Candiote, who took the name of Alexander V. But the other two persisted in retaining their dignity; and as each had some cardinals and other friends and supporters on his side, the Western Church had now three popes instead of one. Gregory kept his court in the Friuli, and Benedict in Catalonia. At last the great council of Constance, in 1415, pronounced again their deposition, and Gregory submitting to it, he was appointed legate to the Marches of Ancona. He died at Recanati in October 1417, being ninety-two years of age.

GREGORY XIII., Ugo Buoncompagni, of Bologna, succeeded Pius V. in May 1572, when he was seventy years of age. He was distinguished for his learning, especially in civil and canon law, and he showed considerable zeal for the promotion of education, by establishing and endowing colleges at Rome and other towns of his states; among others the Roman college which he built in 1582, after the design of Ammanato, and which is also called the Gregorian College. He was the reformer of the Julian Calendar, and his reformation, called the New Style, has been gradually adopted by all the nations of Europe, except the Russians and Greeks. He also caused a new and corrected edition of Gratian's 'Decretum' to be published, with notes. [GRATIANUS.] Gregory is said to have been naturally of a mild disposition; but being extremely zealous for the triumph of the Roman Catholic Church, he, at the beginning of his pontificate, allowed public processions and thanksgivings at Rome when the news of the St. Bartholomew massacre arrived there, although he probably had no share in the plot. The cardinal of Lorraine, who was then in that city, was the chief promoter of these unchristian demonstrations. Gregory also, from the same motive, was implicated in, and gave encouragement to, some plots against Queen Elizabeth of England. He had likewise disputes with Venice, the grand-duke of Tuscany, and other governments, on the subject of ecclesiastical jurisdiction and discipline. In the last year of his life he had the satisfaction of receiving an embassy from Japan, where the Jesuits had made numerous proselytes. He died on the 10th of April 1585, and was succeeded by Sixtus V., who found full employment in clearing the Campagna of the banditti whom his predecessor, mainly intent on maintaining and extending the foreign influence of the papacy, had allowed to increase in number and boldness to an alarming extent.

GREGORY XIV., Nicola Sfondrato, of Cremona, succeeded Urban VII. in December 1590, and died on the 15th of October of the following year. During his short pontificate he showed great zeal for the French league against Henri IV., whom he excommunicated. He was succeeded by Innocent IX.

GREGORY XV., Alessandro Ludovisio, of Bologna, succeeded Paul V. in February 1621. He was a man of much information, and of a mild conciliatory spirit. The first thing he did was to endeavour to put an end to the disturbances of Valtellina, where the people, assisted by the Spanish governor of Milan, had revolted against the Grisons, and massacred all the Protestants in the country. After a sanguinary warfare between the Grisons, the Spaniards, and the Austrians, the court of France joined the pope, the republic of Venice, and the duke of Savoy, for the purpose of putting an end to this state of things, and it was agreed among the various powers that Valtellina should be garrisoned by the papal troops, and that a French auxiliary corps should be stationed in the Grisons to protect them against the Austrians and Spaniards, until the definitive settlement of the differences. Accordingly, Orazio Ludovisio, the pope's brother, was sent to Valtellina with about 2000 men, and there was some talk of placing Valtellina altogether under the see of Rome, or giving it to the pope's family, when shortly after Gregory died, on the 8th of July 1623. He was the founder of the college De Propaganda Fide. He also wrote a letter to the Shah of Persia, 'Epistola ad Regem Persarum Shah Abbas,' published with notes, 8vo, 1627. He was succeeded by Urban VIII.

GREGORY XVI., Mauro Capellari, was born September 18, 1765, at Belluno, in the Lombardo-Venetian kingdom. He entered at an early age into the Camaldolensian order of monks, and having distinguished himself by his learning was elected their vicar-general. On the 21st of March 1825, Leo XII. created him a cardinal, and soon afterwards appointed him prefect of the college De Propaganda Fide. Under Pius VIII. he conducted the negotiation on mixed oaths with the kingdom of Prussia, and was the author of the celebrated papal brief of 1830. On the 2nd of February 1831 he was elected pope, and crowned on the 6th of February. In honour of the founder of the college De Propaganda Fide, Gregory XV., he assumed the name of Gregory XVI. He was a man of respectable character in private

life, but his church administration was bigoted and exclusive, his temporal government harsh and despotic. In the early part of his reign he called in the Austrians to suppress the disturbances which had broken out in the Legations, and his pontificate of fifteen years was nothing less than a long oppression of his subjects. He died June 1, 1846, and was succeeded by the present pope, Pius IX.

GREGORY. A family of this name is unusually distinguished in the history of Scottish science.

JAMES GREGORY, the first and most eminent, was son of the minister of Drumoak in Aberdeenshire, born at Aberdeen in 1638 or 1639, and educated at the university of that town. He went with credit through the usual studies, and showed a peculiar turn for mathematics. Especially he applied himself to optics; and before the age of twenty-four had invented and published in his 'Optica Promota' a description of the reflecting telescope which bears his name, and still continues in the most general use. About 1665 or 1666 he travelled to Italy, and spent some years in prosecuting his studies at Padua. There in 1667 he published his method of expressing circular and hyperbolic areas by means of a converging series, which in the next year he followed by a general method of measuring curved quantities, described by Montucla as a collection of curious and useful theorems for the transformation and quadrature of curvilinear figures, the rectification of curves, the measurement of their solids of revolution, &c., mostly characterised by great elegance, and generalised in a way peculiar to their author. Returning to London about 1668, he was elected F.R.S., and soon after professor of mathematics at St. Andrews. That office he held until 1674, when he accepted the same chair in Edinburgh. In October 1675 he was suddenly struck blind, and died within a few days, at the early age of thirty-six.

His character is thus described by Dr. Hutton ('Phil. and Math. Dict.'):—"James Gregory was a man of very acute and penetrating genius. His temper was in some degree irritable one; and, conscious of his own merits as a discoverer, he seems to have been jealous of losing any portion of his reputation by the improvements of others on his inventions. He possessed one of the most amiable characters of a true philosopher, that of being content with his fortune in his situation. But the most brilliant part of his character is that of his mathematical genius as an inventor, which was of the first order." Dr. Hutton proceeds to give a list of his chief inventions, which follows here in a condensed form:—Reflecting Telescope, Burning Mirrors, Quadrature of Circle and Hyperbola, Method for the Transformation of Curves, Demonstration that the Meridian Line is analogous to a scale of Logarithmic Tangents of the Half-Complements of the Latitude (on which the description of Mercator's Chart depends), Converging Series for making Logarithms, Solution of the Keplerian Problem, Geometrical Method of drawing Tangents to Curves, Rule for the Direct and Inverse Method of Tangents, Various Series for expressing the Length of Curves. It is said that on learning that Newton had discovered a general method of squaring all curves by infinite series, James Gregory applied himself to the subject, and arrived at a similar one. This he was strongly urged by his brother David to publish, but he very generously refused to do so, on the ground that, as he had been led to it by Newton's discovery, he was bound in honour to wait till Newton should publish his. His great powers as a geometrician were in some degree obscured by the length and intricacy of his methods. This fault however he wished partly to correct by the study of Newton's. His quadrature of the circle involved him in a dispute with Huygens, which led him to make improvements in his original method.

The following are James Gregory's works:—'Optica Promota, &c.,' Lond., 1663; 'Vera Circuli et Hyperbolæ Quadratura,' Patav., 1667; 'Geometrisæ Pars Universalis,' Patav., 1668; 'Exercitationes Geometricæ,' Lond., 1668; 'The Great and New Art of Weighing Vanity, &c.' Glasgow, 1772, published under the assumed name of Patrick Mathers, Archdeacon to the University of St. Andrews; and detached papers and letters, published in the Philos. Trans. The 'Optica Promota,' and the tract on 'Weighing Vanity' (a silly satirical production, the authorship of which is by no means certain), were reprinted at the expense of Baron Maseres, in a collection of tracts called 'Scriptores Optici,' London, 1823. There are copious extracts from James Gregory's works in the 'Commercium Epistolicum.'

DAVID GREGORY was the son of James Gregory's elder brother David, a remarkable man, skilled in medicine, philosophy, and mathematics, and the first person, it is said, who possessed a barometer in Scotland. (Hutton, 'Math. Dict.') David Gregory was born at Aberdeen in 1661, and there received the early part of his education, which was completed at Edinburgh. The possession of his uncle's papers is said to have determined his bias to mathematics. At the age of twenty-three he was appointed to the chair of mathematics at Edinburgh which his uncle had formerly held, and he has the distinguished merit of being one of the first public teachers who introduced the Newtonian philosophy into their schools. In 1691 he was chosen Savilian professor of astronomy at Oxford, and admitted to the degree of M.D. He died October 10th 1708, leaving unfinished an edition of the Conics of Apollonius, which was completed by Halley.

David Gregory was a skilful and elegant mathematician, but inferior to his uncle in inventive genius. His chief works are:—'Exercitatio Geometrica de Dimensione Figurarum, &c.,' Edinb., 1684; 'Cætoptrios

et Dioptricæ Sphæricæ Elementa,' Oxf., 1695, republished in English; 'Astronomiæ Physicæ et Geometricæ Elementa,' Oxf., 1702. "This is accounted his masterpiece. It is founded on the Newtonian doctrines, and was esteemed by Newton himself as a most excellent explanation and defence of his philosophy" (Hutton). This work appeared between the first and second editions of the 'Principia,' and Newton took the opportunity of inserting an account of the improvements which he had made since the publication of the first edition. 'Euclidis quæ supersunt Omnia,' Gr. and Lat., Oxf., 1703.

It is remarkable that himself and two brothers were at the same time mathematical professors in three universities. JAMES GREGORY succeeded him at Edinburgh in 1691. CHARLES GREGORY was appointed mathematical professor at St. Andrews in 1707, and, resigning in 1739, was succeeded by his son, another David Gregory. Dr. Reid, professor of moral philosophy at Glasgow, was a nephew of these brothers.

Returning to the elder branch of the family: James Gregory, inventor of the telescope, had one son, JAMES, born in 1674, who became professor of medicine in King's College, Aberdeen. He was the father of JAMES GREGORY, M.D., who succeeded him in his professorship, and of—

JOHN GREGORY, M.D., born at Aberdeen in 1724, and educated in the schools of that town, until he went to pursue his medical studies at Edinburgh, Leyden, and Paris. He filled successively the chairs of philosophy and medicine at Aberdeen, and that of the practice of physic in Edinburgh, to which last he was appointed in 1766. In 1772 he published his 'Elements of the Practice of Physic,' intended as a text-book for the use of his pupils, which he did not live to complete. His other principal works are, 'A Comparative View of the State and Faculties of Man with those of the Animal World,' 1765; and 'A Father's Legacy to his Daughters,' posthumous, 1793, long a most popular work on the character and moral training of the female sex. He was in high repute both as a teacher and as a practising physician, and his popularity was increased by the moral excellence and benevolence of his disposition. He was intimate with the most eminent men of the most brilliant period of Scottish literature, and possessed no mean share of the mathematical genius of his family. He was found dead in his bed on the 10th of February, having retired the night before in his usual health; and it is to this event that the mournful concluding stanzas of Beattie's 'Minstrel' refer. His works were collected in 4 vols. 12mo, 1788, prefaced with a life of the author by Mr. Tytler (Lord Woodhouselee). There is also a life of him by Mr. Smellie.

His son, Dr. James Gregory, became afterwards professor of the practice of medicine at Edinburgh, and a leading member of that distinguished school.

It is stated (Chalmers, 'Biog. Dict.,' p. 289) that no less than sixteen members of this family have held British professorships, chiefly in the Scotch universities. (Brewster, 'Ed. Encycl.,' Hutton, 'Phil. and Math. Dict.')

JOHN GREGORY, born in Buckinghamshire in 1607, deceased in 1647, a very learned divine of the English Church, and GEORGE GREGORY, an English clergyman, born 1754, deceased 1803, for many years editor of the 'New Annual Register,' and author of many works, religious, political, and miscellaneous, require no particular notice. Neither of them was connected with the Scotch family. For their works, and those of other authors of this name, see Watt's 'Bibl. Britann.'

GREGORY, OLINTHUS GILBERT, was born at Yaxley, a small village in Huntingdonshire, January 29th 1774, of humble but respectable parents. At an early age he was placed under the care of the celebrated mathematician, Mr. Richard Weston, who was a contributor to the 'Ladies' Diary,' and other mathematical publications of his day. Under his superintendance Mr. Gregory made much progress in his studies, for at the early age of nineteen, and not long after leaving school, he published his 'Lessons, Astronomical and Philosophical.' Shortly afterwards he prepared an excellent treatise on the 'Use of the Sliding Rule,' which he submitted to Dr. Hutton, Professor of Mathematics, at the Royal Military Academy, Woolwich. This treatise however was never published, though it contained many valuable and original applications of the instrument, useful for practical purposes. This work was the means of opening a correspondence between Mr. Gregory and Dr. Hutton, which ripened into mutual friendship, and was terminated only by death. In 1798, Mr. Gregory removed to Cambridge to assist the editor of a provincial newspaper: he soon however relinquished the sub-editorship, and resolved to open a bookseller's shop, at the same time announcing his intention to give instruction in the mathematical sciences, and resolving to follow that profession alone which should prove the more lucrative. The encouragement he met with as a preceptor speedily induced him to dispose of his books, and to devote his whole attention to the occupation of a mathematical instructor. His correspondence with the 'Ladies' Diary' commenced whilst he resided at Yaxley, in the year 1794, and he continued to write for that useful periodical during his stay at Cambridge. In 1800 he published his 'Treatise on Astronomy,' which he dedicated to his friend and patron Dr. Hutton. This work brought him into much notice, and in the year 1802, the Stationers' Company appointed him editor of the 'Gentleman's Diary,' and another of their annual publications. About the same period he was appointed editor of the 'Pantologia,' and soon after, through the influence of Dr. Hutton, he was appointed a mathematical

master in the Royal Military Academy. In this situation he rose through the various gradations of office, and on the resignation of Dr. Hutton he filled the professor's chair with the highest reputation, until obliged, through indisposition brought on by intense application to study, to resign it in June 1838. The following is a list of his published works:—1793, 'Lessons, Astronomical and Philosophical,' 1 vol.; 1801, 'Treatise on Astronomy,' 1 vol.; 1802, appointed editor of the 'Gentleman's Diary;' 1806, 'Treatise on Mechanics,' 3 vols.; 1807, Translation of Hâüy's 'Natural Philosophy,' 2 vols.; 1808, 'Pantologia,' of which he was the general editor, and the contributor of about one-half, 12 vols.; 1810, Third volume of Dr. Hutton's 'Course of Mathematics,' of which he composed about one-half; he afterwards edited an edition of the whole three volumes of the Course; also 'Letters on the Evidence of Christianity,' 2 vols.; 1815, 'Tracts on the Trigonometrical Survey;' 1816, 'Plane and Spherical Trigonometry;' 1 vol.; also 'Dissertation on Weights and Measures;' 1817, Account of his 'Pendulum Experiments and Astronomical Observations made at Shetland;' this appeared in the 'Philosophical Magazine;' 1818, appointed editor of the 'Ladies' Diary,' and general superintendent of the Stationers' Company's Almanacs; 1825, 'Mathematics for Practical Men,' 1 vol.; 1839, 'Address to the Gentlemen Cadets of the Royal Military Academy,' on resigning the chair of Mathematics; 1840, 'Hints to Mathematical Teachers,' 1 vol.; and 'Tables to be used with the Nautical Almanac.'

Soon after the publication of his excellent treatise on Mechanics, the University of Aberdeen conferred on him the title of LL.D., but the work by which Dr. Gregory is best known is his 'Evidences of Christianity,' which has had an extensive sale, and has been reprinted in Bohn's Standard Library. He also wrote a 'Memoir of the Rev. Robert Hall,' which was originally published in the collected edition of Hall's Works, but was in 1833 republished, with additions as a distinct work, and again with Hall's 'Miscellaneous Works' in Bohn's Library. A memoir of Dr. Mason Good, and various essays, also appeared from Dr. Gregory's pen. Dr. Gregory was a member of almost all the learned societies in Great Britain and the Continent, and was one of the twelve gentlemen who founded the Royal Astronomical Society, of which he was for some time the secretary. His connection with the 'Ladies' and Gentlemen's Diaries brought him into communication with young students who were desirous of distinguishing themselves in the exact sciences, and the period of his superintendance of those valuable works will be long remembered as that in which every meritorious contributor found a friend in the editor.

In 1823 Dr. Gregory was employed at Woolwich in making experiments to determine the velocity of sound. For this purpose he caused mortars, guns, and muskets to be fired at various distances from the observer; and his conclusion was that the velocity of sound, when not affected by the wind, is 1100 feet per second, when the temperature of the air is expressed by 33° (Fabr.); a result which agrees nearly with the result of experiments made at the same time on the Continent.

Dr. Gregory's pleasing manners were completely in accordance with what might have been expected from the preceding remarks; all he did and said was dictated by benevolence of feeling, and he was a man of unbounded charity. As a Christian, he was moral and devout, and as a scholar he merited and obtained the consideration of the first mathematicians of the day; his great zeal in his vocation, his parental kindness, his earnest and impressive admonitions, his entertaining, improving, and philosophical conversation, and his ever-readiness to assist, will be gratefully remembered by many. He took a warm interest in the cultivation of mathematics, to which he may be said to have devoted, with indefatigable perseverance, nearly the whole of his valuable life. He died February 2, 1841.

GRENVILLE, LORD. WILLIAM WYNDHAM GRENVILLE was born October 24, 1759. He was the third son of the Right Hon. George Grenville, a distinguished statesman, who was born in 1712 and died in 1770. He studied at Eton College and at Oxford University. He was elected a member of the House of Commons in 1782, and his eldest brother, the Marquis of Buckingham, having been appointed Lord Lieutenant of Ireland, Mr. Grenville went with him to Dublin as his secretary. Not long afterwards Mr. Pitt gave him the office of Paymaster-General of the Army. In 1789 he was chosen Speaker of the House of Commons. In 1790 he was appointed Secretary of State for the Home Department, and was created Baron Grenville. In 1791 Lord Grenville became Secretary of State for Foreign Affairs, and in all his speeches and proceedings displayed the most determined hostility to the French revolutionary government. In 1792 he married the Hon. Anne Pitt, only daughter of Thomas, first Lord Camelford. He resigned office with Mr. Pitt in 1801, on the king's refusal to give his sanction to the measure for Roman Catholic Emancipation, and when Pitt took office again in 1804, Lord Grenville, Mr. Windham, and others, refused to form part of a ministry which did not include Mr. Fox. When the new ministry was formed after Mr. Pitt's death, Lord Grenville became First Lord of the Treasury, and Mr. Fox Secretary of State for Foreign Affairs. Fox died in 1806, and the Grenville ministry was dissolved in 1807. Lord Grenville's classical attainments were considerable, and in 1809 he was chosen chancellor of the University of Oxford. From 1809 to 1816 Lord Grenville usually acted with Earl Grey. [GREY, EARL.] He was an

opponent of parliamentary reform, and supported generally Mr. Canning's administration. He was an able speaker, and had much influence in the House of Lords. He spent the latter years of his life in retirement at his seat, Dropmore Lodge, Buckinghamshire, where he died January 12, 1834, without issue, when the title became extinct.

THOMAS GRENVILLE, the second son of George Grenville, was born in 1758, and died in 1821. He left his valuable library to the British Museum, of which it now forms a separate portion.

GRESHAM, SIR THOMAS, was descended of an ancient family of Norfolk. His father, Richard Gresham, a younger son, was bred to trade, and was a member of the Mercers' Company. In due time he became a leading man in the city, was agent to Henry VIII. for negotiating loans, &c., with foreign merchants, and obtained the honours of knighthood and the mayoralty. He died February 20th 1548. Thomas Gresham, his second son, was born in London in 1519, and studied at Gonville (now commonly called Caius) College, Cambridge; but Sir Richard, while giving his son the benefit of a liberal education, intended him to tread in his own steps, and bound him apprentice to his brother, Sir John Gresham, who also belonged to the Mercers' Company, and also had acquired a large fortune by trade. Thomas Gresham took out his freedom in 1543. In 1551 he was employed, as his father had been, in negotiating foreign loans by Edward VI.; and he did good service in this capacity. When money became due it seldom was convenient to pay it; and an extension of the time was commonly purchased on terms ruinously high, 10 per cent. for instance, clogged with the further condition of purchasing certain jewels or other wares at the price of the vendor. By Gresham's skill and assiduity the outstanding debts were paid off, and an enormous saving made, the particulars of which, as stated in his own memorial, will be found in Ward's 'Lives of the Gresham Professors,' p. 8. By his advice the experiment of raising money at home rather than from foreigners was first tried by Elizabeth in 1569, and followed with great advantage both to the crown and the nation. He was employed in the same capacity of agent by Mary and Elizabeth, received knighthood from the latter in 1559, and was often consulted by her in political and commercial affairs. His favour, his office, and his princely munificence, combined probably to procure him the title of the Royal Merchant. He built a noble house on the west side of Bishopsgate Street (where the Excise-Office latterly stood), where he lived in splendour, and was occasionally commissioned by the queen to receive and entertain foreign visitors of high rank. Increasing in wealth, he bought estates in many parts of England; among others Osterley, near Brentford, now in possession of the Earl of Jersey, which next to London was his chief place of abode. He died suddenly November 21st 1579, leaving no children except one natural daughter.

In the foundation of the Royal Exchange Sir Thomas Gresham has left a lasting memorial of his wealth and generosity. Previously the merchants were accustomed to meet, without shelter, in Lombard Street. Sir Richard Gresham contemplated the scheme of building an exchange, or covered walk, such as he had seen abroad, but did not effect it. Resuming the design, Sir Thomas offered to erect a suitable building if the citizens would provide a plot of ground. The site north of Cornhill was accordingly purchased in 1566, for more than 3500*l.* The date of completion is not clearly known; but January 23rd, 1570, the queen dined at Gresham's house, visited the new building, and caused it to be proclaimed by sound of trumpet the 'Royal Exchange.' This building was destroyed in the great fire of 1666. A view of it may be seen in Ward's 'Lives.' It was similar in its main features to its successor, consisting of a quadrangular arcade surrounding an open court, with galleries above containing shops, &c. From the rents of these Gresham derived a yearly income of 750*l.*, besides fines. (Ward, 'Appendix,' iv.)

One moiety of his interest herein Gresham bequeathed to the corporation of London, and the other to the Mercers' Company, on condition of their making certain annual payments, amounting to 603*l.* 6*s.* 8*d.* After the fire the Exchange was rebuilt on a larger scale; and it is a striking instance of the rise of prices, that the additional ground required cost 7017*l.* 11*s.* The new building cost 58,962*l.* This, with some alterations, of which the chief was the rebuilding of the clock-tower in 1821, stood till it was again destroyed by fire on January the 10th, 1838. It was again built, as is well known, from the designs of Mr. Tite, on a still larger and more splendid scale, calculated to meet the increased and increasing demands of the metropolitan commerce. The first stone of the present Royal Exchange was laid by Prince Albert on the 17th of January 1842; and on the 28th of October 1844 the completed building was opened in state by Queen Victoria.

GRESSET, JOHN-BAPTISTE-LOUIS, born in 1709, at Amiens, studied at a Jesuit's college, and entered their order in the 17th year of his age. He was afterwards sent to Paris, where he completed his studies in the College de Louis-le-Grand. He was only twenty-four years old when he wrote his celebrated comic poem entitled 'Vert-vert,' which contains the adventures of a parrot, and is one of the wittiest productions in the French language. He published soon afterwards 'Le Carême Impromptu' and 'Le Lutrin vivant,' two witty trifles, and also two beautiful epistles entitled 'La Chartreuse,' and 'Les Ombres.' These productions soon acquired great reputation for the

author, and he was sent as professor to the college of Tours; but the sister of an influential minister taking offence at the light tone of Gresset's poetry, accused him before his superiors, who, by way of punishment, sent him to La Flèche. Several of his poetical epistles, as, for instance, 'A ma Muse,' and 'Au Père Bougeant,' are very well written; but the 'Épître à ma Scour sur ma Convalescence' may be regarded as a masterpiece. Disliking his residence in La Flèche, he requested his superiors to remove him to some other place, and on meeting with a refusal he left the order in the 26th year of his age, but he always preserved a regard for his old colleagues, which is particularly proved by his 'Adieux aux Jesuites.' He now settled at Paris, where his wit and talents, united with agreeable manners as well as his literary reputation, soon made him the favourite of the best society. In 1748 he was received a member of the French Academy, but he soon afterwards retired to his native city of Amiens, where he founded, with the permission of the king, an academy; and having married, he settled in the vicinity of the town. In 1774 he was chosen to congratulate Louis XVI. on his accession in the name of the French Academy. The king gave him a patent of nobility, and Monsieur, afterwards Louis XVIII., nominated him historiographer of the order of St. Lazarus.

Gresset died at Amiens in 1777. Besides the productions already mentioned he wrote several plays, which have not been very successful, except his comedy 'Le Méchant,' which was performed, for the first time, in 1747. His tragedy of 'Edward III.,' which was performed only once, in 1740, and his 'Sydney,' are both inferior productions. In his latter years Gresset became religiously disposed, and destroyed some unpublished plays as well as two new cantos of 'Vert-vert.' He even condemned his former productions, for which Voltaire was very angry with him. The poems of Gresset are characterised by originality, great ease, a refined humour, and a versification always harmonious. He could give life and animation to the most uninteresting subjects. The best edition of Gresset's works is that of Renouard, published at Paris, 1811, in three volumes.

'Vert-vert' has been twice translated into English: 1st, by T. G. Cooper, London, 1759; and 2ndly, by Alexander Geddes, LL.D., London, 1793.

GRÉTRY, ANDRÉ-ERNEST-MODESTE, a celebrated and once most popular composer of French operas, was born at Liège in 1741. At the age of four he gave distinct proofs of the influence which rhythm exercised over his excitable nerves. At six he was placed under a music-master, whose roughness of manners soon rendered it necessary that another teacher should be found for him, and the second proved as gentle as the other had been savage. A company of Italian performers being engaged at Liège, Grétry, then ten years old, was allowed to sing with them in the operas of Pergolesi, Galuppi, &c.; and the bent and strength of his genius was proved, and his destiny was fixed. In his eighteenth year he set out for Rome, and commenced his musical studies under Casali.

During a long residence in the capital of the Papal States, then a musical city, Grétry had constant opportunities of hearing the best works of the first masters, which at length inspired him with a wish to try his own powers. An occasion soon presented itself; he was invited by the manager of the Alberti theatre to set a short opera, 'La Vendemiatrice,' which met with decided success. He was caressed by every order of society, and had the gratification of hearing his airs sung in all the streets. He then went to Bologna, and, having stood the customary test of ability, was admitted a member of the 'Società Filharmonica.' After this he proceeded to Geneva, and produced his first French opera, 'Isabella et Gertrude,' which was most favourably received. There he formed an acquaintance with Voltaire, which continued to the close of the poet's life.

M. Grétry settled finally in Paris, and immediately commenced that brilliant career which, as an artist, scarcely ever suffered the slightest interruption. He speedily joined the society of the literati of Paris, and with Marmontel his intimacy was close and continued. Intercourse of this kind sharpened his intellect and strengthened his judgment, and much of his success as a composer may be attributed to that vigour of mind which he in a great measure acquired by mixing with men of lively imagination, corrected by education.

At the period of the Revolution, Grétry, then 'le Citoyen,' became, at all appearance, a zealous republican; and set some of the revolutionary songs. Napoleon never liked him, and on one occasion he was provoked to rebuke the despotic and rude conqueror in a marked manner. Nevertheless, he was made a member of the French National Institute, Inspector of the 'Conservatoire,' &c. Grétry died in 1818, and was buried with great pomp close by Delille, the poet. The people of Liège demanded as a right to have possession of the heart of their distinguished countryman, and the matter underwent long and grave litigation, which terminated in favour of the claimants.

Grétry's operas are too numerous to be named here. The best known are, 'La Caravane du Caire;' 'Le Tableau Parlant;' 'L'Amitié à l'Épreuve;' 'Zemire et Azor;' 'Les Mariages Samnites;' 'Richard Cœur-de-Lion;' 'Barbe-Bleu;' 'Panurge;' 'Céphale et Procris,' &c. Some of these have been produced on the English stage, with great success; and others have been pillaged by one at least of our deceased pseudo-composers. In 1780, M. Grétry published his 'Essais sur la Musique,' in three 8vo. volumes; and in 1793 the republican government printed

a second edition of the work. These essays are ingenious, rather than entertaining, and exhibit much good musical criticism; but they betray no inconsiderable share of vanity, as well as a want of knowledge of what had already been written on the subject.

GREUZE, JEAN BAPTISTE, a celebrated French painter, was born at Tournus in Burgundy in 1726. He was first instructed by Laudon at Lyon; he studied also in the Royal Academy at Paris, and later at Rome. Nearly all Greuze's pictures are illustrations of the affections or domestic duties: he painted but one historical piece—'Severus reprimanding his Son Caracalla': portraits he painted frequently. Greuze is unique in the French school, and he is sometimes termed the Lachau-ée of Painting, and also less appropriately, the French Hogarth. He was fond of exciting and pathetic scenes; the following are some of his most celebrated pictures:—A Father explaining the Bible to his Family; The Blind Man Cheated; The Good Mother; The Paralytic Father; The Unnatural Father; The Village Bride; The Huntsman's Return; The Broken Pitcher; The Little Girl and the Dog, 'La Petite Fille au Chien,' by some considered his best picture; 'L'Enfant au Capucin'; 'La Dame de Charité'; 'Le Gâteau des Rois'; 'La Fille Honteuse'; 'La Bonne Education'; 'La Paix du Ménage'; 'La Prière à l'Amour'; 'Le Fils Puni,' &c. &c., all of which have been engraved, and many by J. J. Flipart and the elder Massard; 'La Petite Fille au Chien,' has been engraved by Ch. Porporati. But he also painted many figures and portraits of ladies in a semi-nude and very meretricious style.

Greuze was long an associate or agrée of the French academy of painting, but as he was placed in the class of genre (du genre bas) painters, when he was elected a member, he considered it an indignity, and he retired altogether from the academy. He died March 21, 1805.

There are several pictures by Greuze in the Louvre—among them two of his most celebrated works, The Broken Pitcher; The Village Bride, 'L'Accordée du Village,' which was purchased for the royal collection at the sale of the Marquis de Menars for 16,650 francs. In the National Gallery London there is a 'Head of a Girl,' by him. Greuze's pictures are very popular with collectors, and very large sums are paid for them; yet he cannot be considered a great painter. His works have much truth of character, but not only nearly all his subjects are chosen from common life, there is something generally theatrical and meretricious in his treatment. They are however better as illustrations of character than as paintings; his drawings, at least the contours, are generally correct and vigorous, but the intermediate modelling, except in the head, is feeble: he was deficient in light and shade and colour, and his draperies want character, or indeed common truth: his heads are well modelled but generally extravagant in expression.

GREVILLE, SIR FULKE, afterwards LORD BROOKE, was born in 1554. He was the only son of Sir Fulke Greville of Beauchamp Court in Warwickshire, and his mother was a daughter of Ralph Neville, earl of Westmorland. He became a fellow-commoner of Trinity College, Cambridge, but afterwards studied at Oxford. Having then travelled on the continent, he was introduced at court on his return, and soon appointed to a lucrative office in the Court of the Marches of Wales. Possessed however by the adventurous spirit of the times, he made several attempts to escape into foreign service, which were always defeated by Queen Elizabeth's refusal of leave. In 1585 likewise he and Sir Philip Sidney, his distant kinsman and most cherished friend, were brought back by a royal messenger when they had already embarked to accompany Drake to the West Indies. Next year Sir Philip was killed at Zutphen. Greville, knighted in 1597, sat repeatedly for his native county in parliament, and continued to receive tokens of the royal favour till the queen's death. King James was equally well disposed, bestowing on him Warwick Castle (which he repaired at a large expense); but he is said to have disagreed with Secretary Cecil, and did not obtain any new advancement till after that minister's death. In 1615 he was appointed under-treasurer and chancellor of the exchequer, and in 1620 he was raised to the peerage by the title of Baron Brooke of Beauchamp Court. Next year, resigning his post in the exchequer, he became a lord of the bed-chamber. Soon afterwards he founded a history-lecture in the University of Cambridge, endowing it with 100*l.* a year. On the 30th of September 1623, being in his mansion in Holborn, he had an altercation with an old serving-man, who, irritated by what passed, stabbed him mortally in the back, and then destroyed himself. Lord Brooke was buried in St. Mary's church, Warwick, under a monument which he had himself erected, with this inscription:—'Fulke Greville, servant to Queen Elizabeth, councillor to King James, and friend to Sir Philip Sidney. Trophæum Peccati.' He was never married.

Three volumes of his writings were printed after his death:—1. 'Certain Learned and Elegant Workes of the Right Honorable Fulke Lord Brooke, written in his youth and familiar exercise with Sir Philip Sidney,' 1633, small folio. This volume contains three didactic poems, (a 'Treatise of Human Learning,' an 'Inquisition upon Fame and Honour,' a 'Treatise of Warres'), two tragedies on the model of Seneca ('Alaham' and 'Mustapha'), 'Cælia' (being a collection of 109 small poems, called sonnets, though not answering to the name), and two prose letters, one of which is really a long moral essay. 2. 'The Life of the Renowned Sir Philip Sidney: with the True Interest of

England, as it then stood in relation to all Foreign Princes,' &c. &c. 1652, 12mo. 3. 'The Remains of Sir Fulke Greville, Lord Brooke, being poems of Monarchy and Religion, never before published,' 1670, 8vo. All known copies of the volume of 1633 want the first twenty-two pages, and it has been conjectured that these contained the 'Treatise on Religion,' and were cancelled as objectionable probably by order of Laud. Short specimens of his poetry are selected by Campbell and Ellis; his didactic poems are given at full length in Southey's 'Select Works of the British Poets,' 1831; and his 'Life of Sidney' was reprinted by Sir Egerton Brydges.

Lord Brooke was alike proud of being Sidney's friend and of being the patron of Camden, Daverant, and other men of letters. His own literary fame, in modern times, has scarcely been equal to his merits. He is more remarkable however for power and subtlety of thought than for originality of imagery or for felicity of language. His prose is lumbering and dissertative: his life of Sidney is a commentary, not a narrative. His rhymed tragedies too, in form as undramatic as those of his contemporary Sir William Alexander (to which they bear some resemblance), are not less undramatic in substance. Indeed they are hardly so much as intelligible, as representations either of incident or of character. But even in them there is much of that which constitutes the charm of his didactic poems—the pointed enunciation of elevated moral sentiments or of refined metaphysical reflections. There could be culled from his works, and most abundantly from his noble 'Treatise on Human Learning,' a rich store of sententious and finely-thought apophthegms, of the kind which sparkle in the lines of Pope. This poet indeed owes to Lord Brooke several obligations. One of the lines oftenest quoted from the 'Essay on Man' is but an alteration of his line, "Men would be tyrants, tyrants would be gods." The prevailing fault is obscurity of language, caused partly by an anxious straining after conciseness, partly by want of mastery over the mechanism of verse, and partly perhaps by indistinctness in some of the conceptions which flowed in with such variety and swiftness upon his active and searching intellect. Southey had good reason for calling Lord Brooke the most difficult of our poets, but equally good reason for recalling attention to his didactic poems.

GREY, CHARLES, SECOND EARL GREY, was born on March 13th 1764 at Fallowden, near Alnwick, in Northumberland. His family was ennobled in the reign of Edward VI., and, although the peerage became extinct, the family had for eight or nine generations been of consideration. In 1802 Sir Charles Grey, the father of the second earl, was raised to the peerage for his military services, with the title of Baron Grey de Howick, and in 1806 he was created Earl Grey. He died in November 1807 in his seventy-ninth year.

Charles Grey was sent to Eton, and before he had attained his sixteenth year he proceeded to Cambridge, where he remained about two years, and then passed over to the Continent, and made the tour of France, Spain, and Italy, which occupied him about two years.

Mr. Grey's parliamentary career began in 1786, when he was returned as member for the county of Northumberland. He attached himself to the party, and still more to the person, of Mr. Fox. His maiden speech in the House of Commons, in 1787, was in opposition to Mr. Pitt's liberal commercial treaty with France. In 1788, at the age of only twenty-four, Mr. Grey was selected as one of the managers to conduct the trial of Warren Hastings; and in the following year he took a prominent part in the discussions on the Regency Bill. Notwithstanding his youth, and the short time that he had been in parliament, he had already obtained a position in his party of considerable eminence, chiefly no doubt from his aristocratical position and family connections, but he had also acquired a high reputation as a speaker at a time when Fox, Burke, and Sheridan were at the height of their fame as orators.

The opening scenes of the French revolution, and still more the future progress of that event, exercised for many years an absorbing influence over both the foreign and domestic policy of England. The Whigs were agitated by differences of opinion, which destroyed party ties and even broke up private friendships. Fox and Mr. Grey were the leaders of the small but able party which constituted the opposition during the first period of the French revolutionary war. Their object was first to prevent the war, and after it had commenced their earnest desire was to bring it to a close.

The first acts of the French revolution were favourable to popular liberty; and the association called the Society of the Friends of the People, which was formed in England early in 1792, with the object of obtaining a reform in parliament, was joined by the more liberal men of the Whig party, and Mr. Grey was one of the founders and most active members of the society. On April 30th 1792, at the request of the society, he gave notice of a motion for the following session on the subject of parliamentary reform. The motion was to the effect that "the evils which threatened the constitution could only be corrected by timely and temperate reform." Before the motion could be brought forward in 1793, the state of parties had undergone considerable change. The Whigs, at least the more timid or conservative amongst them, had become alarmists, and a section of them under the Duke of Portland were preparing already for the coalition with Mr. Pitt which finally took place in 1794. Fox not only withheld his name from the Society of the Friends of the People, but privately exerted himself to check its proceedings; and it had become popular

to stigmatise men of liberal principles as Jacobins and levellers. The temptation to temporise with the question of reform was great, but Mr. Grey did not yield to it. On the 6th of May 1793 he presented a petition from the Society of the Friends of the People, which elaborately exposed the defects and evils of the existing system of parliamentary representation; and in a striking speech, in which however he did not put forth any plan, he demanded a recurrence to the principles of the constitution. It would appear, from the replies of those who spoke against the motion, that Mr. Grey was ready to adopt universal suffrage, though in the abstract he disapproved of it, rather than that the existing defects in the representation should remain uncorrected. The motion was lost by 282 to 41. On the 25th of May an address was moved in support of a proclamation which the government had issued against seditious writings, when Mr. Grey assailed the minister, and read the resolutions in favour of reform which Mr. Pitt, with Cartwright and Horne Tooke, had agreed to ten years before at the Thatched House Tavern.

For many years, especially during the panic which existed in this country respecting 'French principles,' and in the midst of the extravagance in the public expenditure occasioned by the war, it was an arduous if not a thankless task which an earnest advocate of popular rights, like Mr. Grey, was called upon to discharge. The country was frequently in a critical state; the minister was supported by overwhelming majorities; and events occasionally warranted the executive in adopting bold and vigorous steps which were not precisely constitutional. Mr. Grey's opposition to the measures of the minister was at the time fruitless, but the vigilance of the small band of which he was the most active leader did much to check any more daring inroads upon national liberties. In 1794 Mr. Grey endeavoured, though unsuccessfully, to obtain an inquiry into the conduct of government in bringing foreign troops into England without the consent of parliament; and he was most zealous in opposing the suspension of the Habeas Corpus Act, which the government passed through all its stages up to the third reading in one day. In 1795 he opposed with equal vigour a bill which was calculated to limit, if not to prohibit, the holding of public meetings. On the 10th of March 1796 he moved for a committee on the state of the nation, in which he animadverted on the enormous expenditure, the large advances made by the Bank, and the application of money to purposes different from those for which it had been voted by parliament. On the 6th of May he brought forward a charge of misapplication of public money; and in December he exposed another instance of the unconstitutional appropriation of the public money, in which 1,200,000*l.* had been advanced by the minister to the Emperor of Germany without the consent of the House of Commons, though parliament was then sitting. In 1797 he was one of the committee of secrecy appointed to inquire into the circumstances connected with the stoppage of the Bank, and he dissented from the report which that committee made. On the 26th of May he again brought forward a motion for parliamentary reform; and proposed that 113 members should be returned by the counties, each for one division, and that the franchise should be extended from freeholders to leaseholders and copyholders. The remaining 400 members were to be returned by household suffrage, and the elections were to take place on one and the same day. He intimated that, if such a measure of reform were carried, he would, but not otherwise, shorten the duration of parliament to three years. In the course of his address he intimated the likelihood of his not again taking part in the business of the house if his motion were rejected. On a division it was lost by 268 to 93; and it was not until 1799 that he again made his appearance in the house as a speaker, for the purpose of opposing the first propositions that were made for the union with Ireland. He was opposed throughout to this measure, but submitted a plan for securing the independence of the Irish members by abolishing forty rotten boroughs in Ireland; and he proposed that the addition of Irish members should not increase the numbers of the House of Commons.

The death of Mr. Pitt, in 1806, led to the formation of a Whig ministry under Lord Grenville. Mr. Grey, now become Lord Howick by his father's elevation, was appointed first lord of the Admiralty, and Fox held the seals of the Foreign Office. On the death of Fox in September, the office which he had held was filled by Lord Howick, who met parliament in December as leader of the House of Commons. He and Lord Grenville were now at the head of the Whig party. The cabinet was broken up in March 1807; but during its brief existence Lord Howick had carried through the House of Commons the Act for the Abolition of the Slave-Trade.

In November 1807, on the death of his father, Lord Howick became Earl Grey, after nearly twenty years of his public life had been spent in the House of Commons. In the House of Lords he and Lord Grenville were the leaders of the opposition. One of his first acts as a peer was to protest against the attack upon Copenhagen in the previous year.

In 1809 Lords Grey and Grenville were invited by Mr. Perceval to join his administration, which had been just weakened by the retirement of Mr. Canning and Lord Castlereagh, but the offer was at once declined. On the Prince of Wales being appointed regent, Lords Grey and Grenville prepared, at his request, the answer to be returned to the addresses of parliament; but the prince, in the end, did not make use of it. Early in 1812 the regent addressed a letter to the Duke of

York which he was authorised to communicate to the above two noble lords, in which he expressed a wish that "some of those persons with whom the early habits of his public life were formed would strengthen his hands and constitute part of his government." But as neither Lord Grey nor Lord Grenville could join the existing administration without a sacrifice of principle, the prince's wish was not complied with. Again, on the death of Mr. Perceval, fresh negotiations were set on foot, but like the former they resulted in nothing. Lord Moira was then empowered to treat with the two lords unconditionally; but the negotiations were broken off in consequence of Lord Moira not being authorised to make the power of removing the great officers of the household a part of the arrangement. The negotiations eventually terminated in the formation of the Liverpool administration.

On the return of Napoleon from Elba in 1815, Earl Grey was averse to plunging into another war, and on this occasion he and Lord Grenville took opposite views. During the period of discontent and distress which the country experienced in the first few years after the peace, Earl Grey sought to show that the best way of defending the constitution was to conciliate the affection and esteem of the people, and he urged that the natural mode of removing the discontent of the country was to remove its causes. He therefore condemned the measures of coercion adopted by the government. He moved for an inquiry into the conduct of the government respecting what has been called the 'Manchester massacre,' and though the motion was rejected by 155 to 84, two members of the royal family, the Dukes of Kent and Sussex, voted with the minority. He was strongly opposed to the punishment of transportation for seditious libel, from its liability to become a dangerous means of persecution and proscription. Earl Grey took an active part in the trial of Queen Caroline, and in opposing the Bill of Pains and Penalties which had been brought in against her. The Act for the Emancipation of the Roman Catholics, which was passed in 1829, realised one of the great objects of his political life. He gave his support to Mr. Huskisson's measures of commercial reform.

When Mr. Canning became prime minister, early in 1827, he was supported by most of the leaders of the Whig party; but Earl Grey, so far from joining his party in this course, bitterly attacked Mr. Canning and treated with contempt his pretended liberalism. Himself the model of an inflexible patrician, with high connections and a lofty public character, he seemed as if he regarded the prime minister as a brilliant and dexterous adventurer. The only persons who listened with pleasure to this speech were men whose principles Earl Grey's public life had been devoted to opposing; and yet it was commonly felt that this attack on the minister proceeded from a sense of duty to his party and his order, combined with a peculiar temperament. This at the same time led him into a disdain of popular opinion which was no less a feature of his character. In the same session he supported the amendment of the Duke of Wellington which led to the abandonment of Mr. Canning's corn bill. He knew how unpopular his vote on this occasion would be; but "if," he said, "there should come a contest between this house and a great portion of the people, my part is taken; and with that order to which I belong I will stand or fall;" and, he added, "I will maintain to the last hour of my existence the privileges and independence of this House:" and this lofty view of the rights and privileges of the aristocracy was in fact the key to what was most liberal in his policy, as well as to what appeared most otherwise.

The period was now approaching when, as the crowning act of his long political life, he was to undertake the amendment of the representative system, the object for which his earliest energies had been exerted in unfavourable times. Up to 1830 the slightest measure of parliamentary reform had been resolutely denied. The Duke of Wellington, who was prime minister when the parliament met which was elected on the death of George IV., affirmed, in allusion to something which Earl Grey had said, that "the legislature and the system of representation possess the full and entire confidence of the country, and deservedly possess that confidence." But the second revolution in France, which had just occurred, had given a great impulse to questions of political reform; a new reign and a new parliament had commenced under these influences; and the country generally was in a disturbed and excited state. The duke's administration was compelled to yield to the influence of these circumstances and resigned office. Earl Grey was sent for by William IV. and requested to form a new cabinet. He announced as prime minister that "Peace, Retrenchment, and Reform" would be the objects of his policy. On the 1st of March 1831, Lord John Russell, as the organ of the cabinet, introduced the first Reform Bill into the House of Commons. A brief history of this measure is given in the notice of WILLIAM IV. On the 7th of May 1832, Lord Lyndhurst carried an important motion, which, it was considered by the cabinet, placed the Reform Bill in peril, and they immediately resigned office. The ministerial interregnum was terminated on May 17 by the return of Earl Grey to power. The independence of the House of Lords was for the time virtually destroyed, and means were used, with the king's consent, to prevent the peers who were opposed to the Reform Bill from attending in their places to vote against it. This may have been an inconsistency in Earl Grey, who had so lately pledged himself in favour of the independence of the House of Lords; but he had to choose between

successfully carrying out his plan of parliamentary reform and a violent political convulsion. On the 4th of June the Lords passed the bill by 106 to 22, and three days afterwards it received the royal assent.

The first Reformed Parliament met on the 29th of Jan. 1833, and its great measures were the abolition of colonial slavery, the abolition of the East India Company's monopoly, the reform of the Irish Church, and the reform of the poor law. The cabinet was early shaken by some personal changes. In March 1833, Lord Durham was compelled to resign from illness. At the end of May 1834, Mr. Stanley (now Earl of Derby), Sir James Graham, the Earl of Ripon, and the Duke of Richmond, left the ministry on account of differences with their colleagues. Earl Grey had considered a Coercion Act necessary for Ireland, and a misunderstanding arose with Mr. O'Connell on the subject, which in July led to his lordship's resignation and that of Lord Althorp. Lord Althorp returned to office in about a week, but the cabinet, which no longer possessed the confidence of William IV., was dismissed in the following November, when Lord Althorp, by the death of his father Earl Spencer, was removed to the House of Lords.

For one or two years after his retirement from office Earl Grey occasionally attended the House of Lords, but the last ten years of his life were passed in retirement surrounded by a numerous family and honoured by the general respect of his countrymen. He died at his seat, Howick House, in Northumberland, July 17, 1845, in his eighty-second year. The personal appearance of Earl Grey was stately and commanding; his action graceful and animated; and his voice strong, flexible, and sonorous. As a speaker his style was pure and his manner free from affectation. He was married on the 18th of November 1784, to Mary Elizabeth, only daughter of the Right Honourable William Brabazon Ponsonby, and by her he had ten sons and six daughters. His widow, eight of his sons, and four of his daughters, survived him.

*GREY, HENRY GEORGE, THIRD EARL, sixth child, but eldest son of Charles, second earl, the subject of the preceding article, was born December 28, 1802, received his education at Trinity College, Cambridge, and entered parliament in 1829, as member for the now disfranchised borough of Winchelsea. At this time he bore the courtesy title of Viscount Howick. At the following election of 1830 he was chosen for Higham Ferrers, and in 1831 for the county of Northumberland. Upon the formation of his father's cabinet, he was appointed Under-Secretary of State for the Colonies in 1830, but resigned that post in 1833 upon a difference arising between himself and Lord Stanley, afterwards Earl of Derby, on the question of slave emancipation. He held however the Under-Secretaryship for the Home Department for a few months in 1834, and on the return of Lord Melbourne to power in May 1835, became Secretary-at-War. This office he held until 1841, when he found himself excluded from the representation of the northern division of Northumberland, for which he had sat since September 1832. He soon succeeded however in gaining a seat for Sunderland, and rejoined his party in opposition to the government of the late Sir Robert Peel, against whom he proved a skilful and formidable debater. In July 1845 the death of his father gave him a seat in the House of Peers, and in the following year he became Colonial Secretary in the administration of Lord John Russell. The period was one of considerable interest and importance. During his tenure of office the colonial dependencies were beginning to feel their strength and to claim a representative government. It is not therefore to be wondered at that frequent misunderstandings arose between the colonies and the colonial office, and considerable unpopularity attached itself to Earl Grey for the uncompromising tone which he adopted. Retiring with his party in 1852, he vindicated his administration by a treatise on the colonial policy of his party, published in 1853 in 2 vols. 8vo, which showed that however he might have been misunderstood abroad, his policy was based upon a fixed and consistent principle. He opposed the administration of the Earl of Derby, and stood aloof from that formed in January 1853 by the Earl of Aberdeen, on the dissolution or reconstruction of which under Lord Palmerston, he declined to undertake the post of Secretary for the War Department,—though public opinion pointed him out as peculiarly fitted for it,—on the ground that he dissented from the views generally entertained by the country as to the necessity or justice of the war against Russia. Since that time he has kept aloof from all ministerial ties, but has lent the ministry of Lord Palmerston, on general questions, an independent support. Earl Grey is Lord Lieutenant and Custos Rotulorum of the county of Northumberland, and an official Trustee of the British Museum.

*GREY, RIGHT HON. SIR GEORGE, BART., nephew of the second, and cousin of the third Earl Grey, was born in 1799, and graduated B.A. at Oriel College, Oxford, in 1821, taking first class honours in classics. He was called to the Bar in 1826, and after practising for a short time entered parliament on the Whig interest, in December 1832, as M.P. for Devonport, which he represented till 1847, when he was elected for the northern division of Northumberland; but losing his seat at the general election of 1852, he was returned in the following year as member for Morpeth. He was successively Under-Secretary for the Colonial Department from 1834 to 1839; Judge-Advocate General from 1839 to 1841; and Home

Secretary under the administration of Lord John Russell from 1846 to 1852. He was re-appointed to the latter office on the accession of Lord Palmerston to power in the early part of 1855. He is a Deputy Lieutenant for Northumberland, and one of the civil knights Grand Cross of the Order of the Bath.

*GREY, SIR GEORGE, K.C.B., was born in Ireland, and after receiving a careful education, entered the army, in which he ultimately obtained the rank of captain. In 1836, in conjunction with Lieutenant Lushington, he offered himself to Lord Glenelg, then colonial secretary, to undertake a journey of discovery in Australia. The proposal was accepted, and the expedition left Plymouth in July 1837. It was occupied in exploring the country in the basin of the Glenelg River, from November in the same year to April 1838, when he returned to the Mauritius, after the expedition had suffered much hardship, and Mr. Grey had been wounded. In September of the same year he formed a new expedition to explore the district in the neighbourhood of the Swan River, from which he returned in April 1840. On reaching England, he began to prepare his materials for publication, which was eventually accomplished in 1841, under the title of 'Journals of Two Expeditions of Discovery in North-West and Western Australia,' but before they appeared he had been appointed Lieutenant-Governor of South Australia. In this situation he distinguished himself by his capacity, firmness, and courtesy. He cultivated an acquaintance with the natives, and acquired the language so far as to be able to compile a 'Vocabulary of the Dialect of South-Western Australia.' Early in 1846 he was removed as Governor to New Zealand, where he exhibited the same judicious mixture of firmness and conciliation, which secured him the esteem of the community over which he presided. It was even of more importance in New Zealand than it had been in Australia to gain the confidence and respect of the natives, whose interests had been affected, and whose passions had been roused by some injudicious treatment of the previous governor. Governor Grey paid great attention to this. He says himself he found it impossible to conciliate a numerous and turbulent people, to understand their complaints, or to redress their grievances, without acquiring their language. This he did. The immediate result was an effective and popular government; the collateral results were the publication of a collection of New Zealand poems, and of a most curious and highly suggestive work on the 'Polynesian Mythology, and Ancient Traditional History of the New Zealand Race.' This work was not published till 1855, after Sir George had left New Zealand; he having been appointed in July 1854 Governor and Commander-in-Chief of the Cape of Good Hope. Sir George was created a Knight-Commander of the Bath in 1848.

GREY, LADY JANE, born in 1637, remarkable for her virtues, accomplishments, and untimely death, was of the blood-royal of England, being the great-grand-daughter of Henry VII., whose daughter Mary married first Louis XII. of France, secondly Charles Brandon, duke of Suffolk, by whom she had a daughter, Frances Brandon, married to Henry Grey, marquis of Dorset. Of this marriage Lady Jane Grey was the eldest daughter: there was no male issue. She was distinguished from childhood by her talents; and her acquirements were, for a lady, very unusual. Greek, Latin, Italian, and French, she spoke and wrote with correctness and fluency; and she understood Hebrew, Chaldee, and Arabic. Great beauty, sweetness of temper, piety, and skill in the usual female accomplishments, combined to render her the delight of all, except her parents, whose severity would in modern times be termed brutal, yet did not alienate her willing obedience. (See Ascham's well-known and very beautiful account of an interview with her in his 'Schoolmaster.') Filial obedience proved her ruin. Her father, then created Duke of Suffolk, presuming on his own power and favour, and the declining health of Edward VI., undertook in concert with the powerful Duke of Northumberland to transfer the crown into their own line. With this view a marriage was concluded between Lady Jane Grey and Northumberland's fourth son, Lord Guilford Dudley, in May 1553; and Edward VI. was persuaded by his interested advisers to set aside the rights of his sisters, Mary and Elizabeth, and his cousin Mary of Scotland; and, in consideration of her eminent virtues and royal descent, to settle the crown upon Lady Jane Grey or Dudley. The king died on the 6th of July; and it was not until the 10th that this unfortunate lady even knew of the plot in which she was involved. She was very reluctant to accept the crown; but was at last over-persuaded by the importunities of her parents, and the entreaties of her husband, whom she tenderly loved. The two dukes had no party among the people; and ten days placed Mary in undisputed possession of the throne. Lady Jane and her husband were confined in the Tower, apparently without intention of taking their lives in the first instance. But Wyatt's insurrection determined their fate. Both were beheaded February 12, 1554. Lady Jane Grey's last hours were marked by the same wisdom, piety, and resignation which distinguished the whole of her short and beautiful life. Her only error was being persuaded to accept a crown, to which she had no good title, and for which she did not wish. (Ascham, *Works*; Burnet, *Hist. Ref.*; *Biog. Brit.*)

GRIBOYEDOV, ALEXANDER SERGIEVICH, a Russian poet and diplomatist, was born at Moscow about 1793, studied at the university of that capital, and in 1810 took a preliminary degree in

the ethico-political branch. When the war of invasion broke out in 1812, he quitted his studies to take a cornetcy in a regiment of hussars, and continued with the army till the successful issue of the campaign of 1815. He then went to St. Petersburg, where he became acquainted with the dramatic poet Khmelnitzky, and was concerned in some trifling dramatic efforts. In 1817 he entered the diplomatic service, and in the following year was sent as secretary to the Russian embassy in Persia, where he succeeded in engaging the especial favour of Prince Abbas Mirza, who procured for him, from his father the Shah, the Persian order of the Lion and Sun. Of the modern Persian he made himself such a master as to be able to compose Persian verses. At the same time he studied English at the English embassy, and became noted for his thorough acquaintance with English, German, and French, as well as a less perfect knowledge of Latin and Italian. While residing in Georgia he composed a comedy, to which he gave the name of 'Gore of Uma,' which may be rendered 'The Misfortune of Cleverness.' It was circulated in manuscript in 1823, and for many subsequent years, the author being unwilling to submit it to the ordeal of the censorship. The plot is inartificial, but there has been but one voice as to the excellence of the character, the dialogue, and the language. The characters are chiefly the representatives of classes, the old courtier of Catherine the Second, the young liberal of modern Russia, &c.; the dialogue is lively and spirited in the highest degree, and the language is so remarkably idiomatic and appropriate, that many of the expressions have passed into proverbs. It has been pronounced the best picture of Russian society in existence, and bitter as is its tone, as bitter as that of Byron on English society, its popularity was so great, that it is said it was difficult to find a person of any social pretensions who did not know large portions of it by heart.

When the abortive conspiracy of December 1825 broke out on the accession of Nicholas, Griboyedov was at once suspected as a member of the liberal party, and summoned from Georgia, where he was then employed, to make his defence. The emperor, who of course had heard of his comedy, had a curiosity to see him in person, and after an interview he was dismissed with favour. When the war broke out with Persia he resigned his diplomatic for military duties, and made the campaign with Prince Paskevich, who was his kinsman, and who, on concluding the war in 1828, with the treaty of Turkmanohai, so disastrous for Persia, sent Griboyedov to St. Petersburg with the news. On the final conclusion of the peace, Griboyedov was named Minister Plenipotentiary at the Persian court. A dark presentiment made him receive the appointment with marked unwillingness. He said repeatedly to his friends, "I am going to my grave. I feel that I shall never see Russia again." His words were fatally verified. On the 12th of February 1829 the populace of Teheran, enraged, it is said, by some fugitive Armenians being harboured by the Russian embassy, made an attack on the house, and massacred the ambassador, together with all the persons connected with the embassy, and all the Russian merchants in the city whom they could lay their hands on. The murdered body of Griboyedov was dragged through the streets at a horse's tail.

In the year 1832 the Emperor Nicholas gave his special permission for the publication of 'Gore of Uma,' and for its representation on the stage, with a few omissions. Its reputation has rather increased than otherwise, and it is now generally acknowledged as the head of Russian comedy. Griboyedov had other works in preparation, of which he had read portions to his friends, and of which they augured highly, but they perished with their author in the outbreak at Teheran. His works, which were collected and published at St. Petersburg, a few years back, with a life by Bulgarin, occupy but one small volume, which is regarded as a Russian classic.

GRIESBACH, JOHN JAMES, was born at Butzbach in Hesse Darmstadt, on the 4th of January 1745. At an early age he commenced his grammatical studies in the Gymnasium at Frankfurt-on-the-Main, where his father performed the duties of a Lutheran minister and consistorial councillor. From Frankfurt he went, in 1762, to the University of Tübingen, and afterwards passed two years at the University of Halle, whence he removed to that of Leipzig. In 1767 he returned to Halle, and took the degree of M.A.; having, throughout a highly distinguished collegiate course, attended all the lectures of the most eminent professors, and applied himself with unwearied diligence to the critical study of philology, moral philosophy, and especially to theological, biblical, and ecclesiastical literature, in which he received, as a pupil, the most valuable assistance from Semler and Ernesti. He now determined to devote himself wholly to a critical examination of the doctrines and of the Greek manuscript texts of the New Testament; and as, in his comprehensive plan of preliminary acquirements, it appeared to be a most desirable object to visit foreign countries, in order to acquire personally a knowledge of the dogmas of their religious sects, and to examine the contents of their principal libraries, he commenced, in 1769, at the age of twenty-four, an extensive literary tour, in which, after inspecting the treasures of the learned institutions of Germany and Holland, he visited and made a sojourn of several months in England, assiduously prosecuting his critical researches in the libraries of the universities, and of the British Museum, chiefly on his favourite subject of the ancient manuscript versions of the New Testament. He next proceeded to visit the libraries of Paris and of other parts of France, where, as he had done in Germany, Holland,

and England, he established an intercourse with many of the most eminent scholars and divines; and having at length collected a large mass of valuable materials, he returned in 1770 to Frankfurt, for the purpose of arranging them and applying them to his purpose of producing a new emendation of the text of the Christian Scriptures. In the following year he obtained much applause at the University of Halle in sustaining, as an academical exercise, a critical dissertation, 'De Codicibus quatuor Evangeliorum Origenianis,' in consequence of which he became theological lecturer, and in 1773 he was appointed professor extraordinary of theology at this university. The preparation of his important edition of the New Testament he now prosecuted with great zeal and diligence. Of this valuable work a particular account is given below, with a notice of several of the author's other publications. The reputation he acquired at Halle in correcting and illustrating the sacred text procured for him one of the divinity professorships at the University of Jena, his acceptance of which he signalled by the production of several learned programmes on subjects hereafter named; and on taking in 1777 the degree of D.D., he sustained a critical dissertation entitled 'Curæ in historiam textûs Græci Epistolarum Paulinarum specimen.' On various other academical occasions he wrote several learned and interesting essays on biblical subjects; he also was one of the directors of the 'Gazette' of Jena; contributed numerous articles to learned periodicals; and in 1780 he was elected rector of that university, and inspector of the students from Weimar and Eisenach. In the following year he was appointed ecclesiastical councillor to the Duke of Saxe-Weimar, was chosen prelate and deputy of the district of Jena, and was made a member of the states of Saxe-Weimar. In the performance of his academical duties he was indefatigable, and usually delivered three lectures daily on theological subjects. The task of perfecting his edition of the New Testament gave him anxious and laborious employment until nearly the time of his death; and, besides his editorial labours, he was actively engaged in the typographical arrangements for the costly and beautiful impression of this work, completed in 1807, for which the types were expressly founded by the eminent printer Göschen. To this brief biographical sketch of Dr. Griesbach, it may be added that at the age of thirty he married Frederica Juliana, a sister of Professor Sebütz. He died on the 24th of March 1812.

The first edition of Griesbach's critical emendation of the text of the New Testament was published at Halle in 1774-75, 8vo, in three successive parts, as manuals for the students then attending his course of divinity lectures at Jena. Some bibliographical particulars respecting this and the several subsequent editions are given in Mr. Horne's 'Introduction to the Bible.' Of the second edition, the first volume appeared in 1796, and the second volume in 1807. This fine impression was made under the careful inspection of the professor himself; and in consequence of the cost of the paper having been munificently defrayed by the chancellor of the University of Cambridge, the Duke of Grafton, the volumes bear the imprint of 'Hals et Londini.' They were handsomely reprinted in London in 1809 and in 1818. In their copious Latin prolegomena are exhibited a critical history of the printed text, a catalogue of all the manuscripts from which various readings are cited, an account of the author's method of proceeding, and rules for determining the comparative value of various readings. Bishop Marsh, in his 'Divinity Lectures' (part ii. sec. 3), has passed a high eulogium on Dr. Griesbach with regard to this important work, declaring his diligence to be unremitting, his caution extreme, and his erudition profound.

Previous to giving a particular account of the critical system of Griesbach's edition of the New Testament, it will be convenient to name his various other works, several of which form indispensable portions of, or appendages to, the elaborate apparatus of Biblical criticism presented principally in the prolegomena to his New Testament. Nearly the whole of his writings are in Latin, and all are more or less directly devoted to the elucidation of Biblical subjects, as follows:—

'Dissertatio de Fide Historica, ex ipsa rerum quæ narrantur natura judicanda,' 4to, 1764. 'Dissertatio Hist. Theol. locos Theologicos ex Leone M. Pontificis Romano sistens,' 4to, 1768. 'Dissertatio de Codicibus quatuor Evangeliorum Origenianis,' 4to, 1771. 'De vera Notione Vocabuli Græci, in cap. 8, Epistolæ ad Romanos, 1 et 2,' 4to, 1777. 'Curæ in Historiam Textûs Græci Epistolarum Paulinarum,' 4to, 1777. 'Programma de Fontibus unde Evangelistæ suas de Resurrectione Domini Narrationes hausierint,' 1784. 'Programma de Imaginibus Judaicis quibus Auctor Epistolæ ad Hebræos in describenda Messiam provincia usus est,' 4to, 1792. 'Anleitung zum Studiren der Popularen Dogmatik,' 1789 ('Introduction to the Study of the Popular Christian Dogmas'). This, from the nature of its object, became the most popular work of the author; and in ten years after its publication had passed through a fourth edition. 'Commentarius Criticus in textum Græcum Novi Testamenti,' 1798 and 1811. 'Commentatio quæ Marci Evangelium totum et Matthæi et Lucæ Commentariis deceptorum esse monstratur,' 4to, 1789. 'Recognita multisque augmentis locupletata in Commentationibus Theolog.,' 1794. Griesbach's 'Opuscula Academica' were edited by the learned Jo. Phil. Gabler, and published in 8vo at Jena in 1824. 'Symbolæ Criticæ, ad suppleandas et corrigendas variarum Novi Testamenti Lectionum Collectiones: accedit multorum Novi Testamenti Codicum Græcorum

descriptio et examen,' 2 tom. 8vo, 1785-93; a most important work, containing a full development of the author's system of Biblical criticism. The second volume contains a laborious collation, with the Greek Vulgate, of all the quotations from the New Testament made by Origen and Clemens Alexandrinus. 'Synopsis Evangeliorum Matthæi, Marci, et Lucae, una cum iis Joannis Pericopis, quæ Historiam Passionis et Resurrectionis Historiam complectuntur,' 8vo, 1797. As some of the transpositions were deemed arbitrary, and several important passages were omitted in this synopsis of the first three gospels, the work was made the basis of a more complete synopsis by De Wette and Lücke, published in 4to at Berlin, in 1818.

Of all modern critical editions of the New Testament, Griesbach's was at the time of its publication the most complete and valuable, and consequently his text has been taken as a standard by numerous other editors. His marginal notes, as forming a general and correct index to the great body of collated Greek manuscripts (about 500), are a treasure invaluable to the scholar and necessary to the divine. Every emendation is introduced on quoted authority, and never on mere critical conjecture; and a very important advantage, not previously afforded, is a clear and precise statement of the relative degree of authority for each particular reading. Adopted readings are distinguished by a different type; those rejected are inserted in the margin with appropriate references, and those not admissible into the text, but yet worthy of consideration, are exhibited with indications of their respective claims. It is generally agreed that the best practical mode of distinguishing authentic from spurious readings is decidedly the classification of manuscripts suggested by Bengel and Semler, and reduced to practice by Griesbach, who distinctly avows the derivation of his plan from those distinguished critics. ('Prolegom.' in New Testament.)

The peculiar principle of Dr. Griesbach's system consists in a division of the Greek manuscripts of the New Testament into three classes, each of which is considered as an independent witness for the various readings of the manuscripts which it comprises. He thus contemplates the existence of three distinct species of texts, which, with respect to their relationship or affinity, are called by Bengel 'families,' and by Semler, Griesbach, and Michaelis, 'recensions,' or 'codices,' namely:—1. The 'Alexandrine' recension or codex, comprehending manuscripts which, in peculiar readings, agree with the citations found in the early Greek-Egyptian Fathers, particularly Origen and Clemens of Alexandria. 2. The 'Western' recension, which is identified with the citations of the Latin Fathers, especially Cyprian and Tertullian, and was used by the Christians of Carthage, Rome, and the west of Europe. 3. The 'Byzantine' or Asiatic recension, comprising numerous manuscripts which were used especially in the see of Constantinople and the adjacent Oriental provinces, and have furnished the Received Text, called the Greek Vulgate. Each of these recensions has characteristics peculiar to itself, yet no individual manuscript exhibits any recension in a pure state, but is assigned to the Alexandrine or Western class, as the peculiar reading of each of those classes preponderate. Though Griesbach considers departures from the received Greek Vulgate as various readings, he does not allow the existence of any standard text as a criterion for determining which are genuine or spurious readings; his object being to show, not the character of particular deviations from any individual recension, but the general coincidences of manuscripts with one recension or codex more than with another. The authorised text does not regulate, but is regulated by, his critical opinion of its comparative value; and the immense number of various readings form a floating medium in which the genuine text is considered to be in all instances discoverable. However, although he professes to determine the value of readings by the number of classes by which they are supported, he constantly displays a very decided preference for the Alexandrine class, which he places far above the two others in the rank of authority; a few manuscripts of this recension being supposed to outweigh a multitude of such as belong to the Byzantine recension, which he regards as certainly the most untrustworthy of all. ('Prolegom.' lxxii.) The reason assigned by Griesbach for this decision is the fact that, the Greek transcripts of this class contain a remarkably large number of suspected readings, owing to the very great liberties taken by learned copyists in making successive alterations; and finding the coincidence of the numerous Scriptural quotations of Origen of Alexandria with the celebrated Greek manuscript of the New Testament from that city to be very striking, he thence concludes that the passages now extant in this Father's writings, of the commencement of the third century, discover the earliest and therefore the purest text of which we have any knowledge to be that of the Alexandrine manuscripts. His ultimate choice of readings is consequently determined by the testimony of Origen, in confirmation of which he often adduces much collateral evidence from the primitive fathers and versions; and of the readings thus proved to be genuine is formed his corrected text of the New Testament.

Against the complicated hypothesis on which Dr. Griesbach has based his system of recensions many very important objections were urged by learned Biblical critics of Germany, and in England especially by Archbishop Lawrence and Dr. Frederic Nolan. The primary fact enforced by Griesbach, that the Alexandrine readings which are sup-

ported by the quotations of Origen possess the highest authority of all, is disputed by Professor Matthiæ, of Moscow, in his critical edition of the New Testament, and with greater confidence by Professor Martin Scholz, of Bonn, in the prolegomena to his very learned and elaborate edition, founded on a system wholly at variance with that of Griesbach. The Alexandrine manuscripts are acknowledged by Scholz to be more ancient, but he asserts them to be more corrupt than any others, and contends that in Alexandria the alterations of the text principally originated. He divides all the manuscripts, not as Griesbach, into three, but into two classes, the Byzantine and the Alexandrine, in which latter he includes the Western; and he gives a decided superiority to the authority of the Byzantine recensions, which, in opposition to Griesbach, he strenuously maintains to be directly derived from the autographs of the evangelists and apostles themselves. The work by Archbishop Lawrence on this subject is entitled 'Remarks upon the Systematical Classification of Manuscripts adopted by Dr. Griesbach,' 8vo, 1814. The learned author states that, he considers Griesbach to be what Bishop Marsh denominated him, "the most consummate critic that ever undertook an edition of the New Testament;" but in the course of his critical strictures on the origin and execution of his plan of appreciating manuscripts, he employs the severest terms of censure, observing that "Griesbach's mode of investigation is unsatisfactory, his classification fallacious, and his statement of the number of readings inaccurate; that no such classification of the manuscripts of the New Testament is possible; the existence of three distinct species of texts being a fact only synthetically presumed, and not capable of any analytical demonstration; so that the student finds he is treading not on solid ground, but on a critical quicksand."

Griesbach was long and severely attacked by Trinitarian writers as an opposer of the doctrine of Christ's divinity, chiefly in consequence of his having rejected from his text the celebrated passage respecting the three that bear witness, 1 John, v. 7, and also for inserting *ὁ*s for *Θεός* in 1 Tim. iii. 16, and *Κυριου* for *Θεου* in Acts xx. 28. In consequence of these and other points in his critical works the commendation and patronage of the Unitarians were bestowed upon him; but in the preface to his treatise on the apostolical writings, he makes the following solemn declaration:—"Ut iniquas suspiciones omnes, quantum in me est, amoliar, et hominibus malevolis calumniandi anam præripiam, publice profiteor, atque Deum testor, neutiquam me de veritate istius dogmatis dubitare;" and to this may be added a statement from his 'Prolegomena,' namely, that "nulla emendatio a recentioribus editoribus tentata ullam Scripturæ Sacræ doctrinam immutat, aut evertit," though "paucæ sensum sententiarum afficiunt." The laborious and minutely learned work by the Reverend Dr. Nolan, entitled 'An Inquiry into the Integrity of the Greek Vulgate, or Received Text of the New Testament,' published in 1815, is chiefly occupied in presenting evidence to subvert the critical system of Griesbach, and to establish the position since taken by Professor Scholz and others, that the Byzantine and not the Alexandrian codices are the most worthy of reliance. "Griesbach's theory," says Dr. Nolan, "is one of the most elaborate of those that have unsettled the foundation on which rests the entire canon. His corrected text can be received only as a proof of the general corruption of the Sacred Scriptures, and of the faithlessness of the traditional testimony by which it is supported, since he states that the two principal classes of text, the Alexandrine and the Western, have been interpolated in every part; that the authorised Greek version exhibits 150,000 various readings, and has remained 1400 years in its present state of corruption; that there appears therefore to be no reservation by which the doctrinal integrity of the Sacred Scriptures can be saved; for if, in the apostolic and primitive ages, corruption was prevalent, whatever be the text gathered out of the immense number of various readings, it may be as well any other as that originally delivered by the inspired writers." Griesbach indeed declares, in his 'Symbolæ Criticæ,' that the manuscripts of the Alexandrine and Western recensions, on which his system is founded, were grossly corrupted in the age succeeding that of the apostles; that those which he held in the highest esteem were corrupted in every page by marginal scholia and interpretations of the fathers, and contained innumerable and very serious errors ("innumeros gravissimo-que errores.") He further states in the same treatise that no reliance can be placed on the printed editions of the works of Origen, on the fidelity of his different transcribers, on the accuracy of his quotations, or, finally, on the copies of the Scriptures from which he quoted; so that, as observed by Dr. Nolan, we have only to take his own account of the state in which he finds the best part of his materials to discover the extreme insecurity of the fabric which he has raised on such a foundation. "His innovations," continues the same learned divine, "are formidable in number and nature; his corrections prescribe three important passages (already named) affecting the doctrinal integrity of the inspired text; for a proof once established of its partial corruption in important matters must involve its character for general fidelity; and the deservedly high character and singular merit of this learned edition must heighten apprehension and alarm at the attempts thus made to undermine the authority of the Received Text, for the scrupulous accuracy of its execution must always command respect." In addition to the works above mentioned, reference has been made

to the 'Life of Griesbach' by Professor Köthe (in German); to Horne's 'Introduction to the Holy Scriptures,' 7th ed., vol. ii, p. 22, &c.; to Dr. Seiler's 'Biblical Hermeneutics,' pp. 340-360; &c.

GRIFFITH, WILLIAM, was born in the year 1810, and having been destined for the medical profession, he completed his education at University College, then called the London University. He distinguished himself in the medical classes, but more especially in that of botany, of which Dr. Lindley was the professor. He went out to India as an assistant-surgeon on the Madras establishment, where he arrived on the 24th of September 1832. Shortly after his arrival he was appointed by the Bengal government to examine the botany of Tenasserim. In 1835 he and Dr. McClelland were selected to accompany Dr. Wallich into Assam for the purpose of reporting upon the growth of the tea-plant. From Assam he proceeded in company with Dr. Bayfield to examine the then unexplored tracts which lie beyond Luddya and Ava, on the extreme frontier of the eastern territories of Great Britain. In 1837 he was appointed to accompany Captain Pemberton on his mission to Bootan. Two years afterwards, in 1839, he was sent with the army of the Indus to examine the character of the vegetation of Afghanistan. During these several journeys he lost no opportunity of making observations and collecting objects in natural history. Although his appointments mostly had regard to his botanical knowledge, his reports, and letters written during his journeys, as well as his papers, show that there was little of interest to the naturalist that escaped his notice. In his travels he collected both plants and animals. In collecting plants he had the object in view of writing a 'Flora of India,' and to this great work he never ceased to devote himself. Many of his zoological specimens were sent to Europe, and have been described and published by various naturalists. He devoted much time to the fresh-water fishes of India, of which he made a large collection, and an account of them has been given in the 'Calcutta Journal of Natural History.' At the time of his death his collection of birds consisted of about six hundred specimens, affording perhaps one of the most extensive and instructive illustrations of the geographical distribution of the birds of India extant.

In 1841 Griffith was appointed to the medical duties at Malacca, and upon Dr. Wallich's absence owing to illness, he was appointed to the superintendence of the Botanical Garden at Calcutta, and the duties of the Professor of Botany in the Medical College. On the return of Dr. Wallich he resumed his place at Malacca, and was there seized with the disease of his liver, which terminated his existence on the 9th of February 1845.

Griffith's was a life rather of promise than fulfilment. He was educated in England at a time when the blind deference which was paid to the authority of Linnaeus as the end of botanical inquiry was beginning to pass away under the influence of the writing and teaching of Professor Lindley at University College; and when the genius and profoundly philosophical views of Robert Brown were becoming appreciated by his countrymen. He saw the right direction of botanical investigation, and in the wide field for research which his residence in India afforded aimed at something more than the collecting of specimens and the descriptions of species. His life was too short to observe much, and his illness too rapid to afford opportunity for publishing many of the results of his observations. He has however left papers scattered in journals and Transactions, which indicate very extraordinary powers of observation, and throw much light on the subjects on which they treat. Among these papers may be specially mentioned those 'On the Ovulum of Santalum, Osyris, Loranthus, and Viscum,' 'On the Structure and Relations of the Various Forms of Rhizantha,' in the 18th and succeeding volumes of the 'Transactions of the Linnean Society.' Amongst other contributions to botany by Griffith are—'A Memoir of the Structure of Salvinia and Azolla,' in the 'Calcutta Journal of Natural History;' a 'Description of Two genera of Hamamelida, two species of Podostemon, and one species of Kaulfussia,' in the 'Asiatic Researches;' on the family of Rhizophoraceae, and a report on the 'Tea-plant of Upper Assam,' in the 'Transactions of the Agricultural Society of Calcutta.'

GRIMALDI, FRANCESCO MARIA, an Italian philosopher, and a member of the order of Jesuits, was born at Bologna in 1619. His education being completed, he was, according to Montucla, employed during several years in giving instruction in the belles-lettres; and during the latter part of his life he applied himself to the study of astronomy and optics. He died at Bologna, in 1663, in the forty-fourth year of his age.

Grimaldi was associated with Riccioli in making astronomical observations, and he gave particular descriptions of the spots on the moon's disc. It was asserted by Montucla that Grimaldi gave to those spots the designations by which they are now distinguished among astronomers; thus superseding the names of the mountains and seas of the earth which had been given to them by Hevelius; but this is apparently a mistake.

That which has given celebrity to Grimaldi is his work entitled 'Physico-mathesis de Lumine, Coloribus, et Iride aliisque annexis,' which was published at Bologna, in 4to, in 1665. The greater part of the work consists of a tedious discussion concerning the nature of light, the conclusion of which is that light is not a substantial but an accidental quality; the rest however possesses the highest interest, since it contains accounts of numerous experiments relating to the

interferences of the rays of light. A description of the work is given in the 'Philosophical Transactions' for that year.

Grimaldi, having admitted the sun's light into a dark room, through a small aperture, remarked that the breadths of the shadows of slender objects, as needles and hairs, on a screen, were much greater than they would have been if the rays of light had passed by them in straight lines. He observed also that the circles of light formed on a screen by the rays passing through a very small perforation in a plate of lead was greater than it would be if its magnitude depended solely on the divergency of the rays; and he arrived at the conclusion that the rays of light suffer a change of direction in passing near the edges of objects: this effect he designated 'diffraction.' By Newton it was subsequently called 'inflexion.' He found that the shadow of a small body was surrounded by three coloured streaks or bands which became narrower as they receded from the centre of the shadow; and, when the light was strong, he perceived similar coloured bands within the shadow: there appeared to be two or more of these, the number increasing in proportion as the shadow was farther from the body.

Having admitted the sun's rays into a room through two small circular apertures, Grimaldi received the cones of light on a screen beyond the place where they overlapped each other; and he observed, as might be expected, that, within the space on which the rays from both apertures fell, the screen was more strongly enlightened than it would have been by one cone of light; but he was surprised to find that the boundaries of the penumbral portions which overlaid one another were darker than the corresponding portions in which there was no overlaying. This phenomenon of interference was, at the time, enunciated as a proposition:—"That a body actually enlightened may become obscure by adding new light to that which it has already received."

Grimaldi also observed the elongation of the image, when a pencil of light from the sun is made to pass through a glass prism; but he ascribed the dispersion of the light to irregularities in the material of which the prism was formed; and he was far from suspecting the different refrangibilities of the rays. The discovery of this fact, which has led to so many important consequences in physical optics, was reserved for Newton.

GRIMALDI, GIOVANNI FRANCESCO, called IL BOLOGNESE, a celebrated Bolognese painter, born in 1606, was the pupil and relation of the Carracci. He was particularly excellent in landscape, both as a painter and an etcher: he etched some of the landscapes of Titian. He painted also history and portrait, and was employed by Louis XIV. and the Cardinal Mazarin for three years at Paris, painting in the Louvre and in the cardinal's palace. He was also much employed by Innocent X. at Rome, in the Vatican, in the Palazzo Quirinale, and in the Church of San Martino a' Monti; and there are some good landscapes by him in the Colonna Palace. He died at Rome in 1680: Pietro Santo Bartoli married one of his daughters. His son Alessandro assisted him in some of his works; he was a good painter in a style similar to that of his father.

GRIMM, F. M., BARON, was born at Ratisbon, in 1723, of poor parents, who gave him however an excellent education. Having finished his studies he published a tragedy called 'Banise,' which proved a complete failure. He afterwards accompanied a young Count Schönburg to Leipzig and to Paris, where he became a reader to the duke of Saxe-Gotha. This place however was more honourable than lucrative, and Grimm was in very narrow circumstances when he made the acquaintance of J. J. Rousseau, which became a close intimacy, strengthened by the fondness for music of both of them. Rousseau introduced him to Baron Holbach, Madame D'Épinay, and other persons distinguished either by their rank or talents. When Paris became divided between the partisans of the French and Italian music, Grimm declared for the latter and became the leader of the *Coin de la Reine*, a party so called on account of their assembling in the pit, under the box of the queen, while the opposite party, assembling under the box of the king, was called *Coin du Roi*. Grimm wrote on the occasion a witty pamphlet, entitled 'Le Petit Prophète de Boemischbroda,' Paris, 1763. His opponents tried to answer him, but were entirely beaten out of the field by another pamphlet entitled 'Lettres sur la Musique Française.' His antagonists now talked about banishment or the Bastille, but the excitement soon subsided, and the author received universal praise. On becoming secretary to Count Friesen he obtained still easier access to the higher circles of society, where his chief object was to gain the favour of the ladies by the elegance of his conversation, manners, and external appearance. His relations with the editors of the 'Encyclopédie,' and with many other eminent individuals of France, as well as his talents and great tact, opened to him a brilliant career. On the death of Count Friesen he became secretary to the Duke of Orleans, and began also at that time to write for several German princes his literary bulletins, which contained exceedingly clever analyses of all the more important literary productions of France.

In 1776 he was nominated by the Duke of Gotha his minister at the French court with the title of baron, but this circumstance did not interrupt his literary occupations. He left France at the Revolution, and retired to Gotha. In 1795 he was nominated by the Empress Catharine of Russia her minister at Hamburg, a post which he

occupied for some time, until a severe illness, by which he lost an eye, compelled him to resign it. He returned to Gotha, where he died in 1807. After his death appeared his 'Correspondence Littéraire, Philosophique, et Critique,' 16 vols. Paris, 1812; another edition with a supplement, by Alexander Barbier, 1814; and a new edition, more complete than either of the preceding, was published at Paris, 1829, in 15 vols.

* GRIMM, JACOB LUDWIG CARL, was born on the 4th of January 1785, at Hanau, in the Electorate of Hesse-Cassel. When he was about six years old, his father, who was a lawyer, was appointed Amtmann at the small town of Steinau-an-der-Strasse, where the children, five sons and a daughter, were brought up in the principles of the Calvinistic sect of Protestants. The father having died leaving the mother with very small means, one of her sisters, who was lady of the chamber (kammerfrau) to the Landgräfin of Hesse, assisted in supporting the family; and at her cost in 1798 Jacob and his brother Wilhelm were sent to the Lyceum at Cassel. In the spring of 1802, a year earlier than Wilhelm, who at this time was attacked by a long and severe illness, Jacob went to the university of Marburg, where he studied law, not from inclination, but because his father, who had been a jurist, had destined him for the legal profession, and his mother also wished it. One of the professors at Marburg was Savigny, the celebrated writer on Roman law, who having gone to Paris in the summer of 1804, in January 1805 invited Jacob Grimm to join him, in order to assist him in his literary occupations. He did so, and remained with Savigny till September 1805, when he returned to Cassel, where his mother then resided, accompanied by Wilhelm, whom he had met at Marburg, and who had then completed his studies. In January 1806 Jacob obtained a situation in the office of the Secretary of War, with a very small salary. His mother died in May 1808, and not long afterwards, when a large portion of the Electorate of Hesse-Cassel had been incorporated by Napoleon I, in the newly-formed kingdom of Westphalia, Jacob Grimm, through the influence of Johann von Müller, was appointed superintendent of the private library of the king, Jerome Bonaparte, which was formed in his palace at Wilhelmshöhe. He received his appointment on the 5th of July 1808, with a salary of 2000 francs, which a few months afterwards was increased to 3000. After the lapse of another short interval the king himself told him, February 17, 1809, that he had named him an auditeur to the state-council, and that he was still to retain his place as librarian. His salary was then increased to 4000 francs (about 160*l.*) This income removed all anxiety as to the means of subsistence, and as his duties were very light he had abundant leisure and means to pursue his favourite investigations into the mediæval literature of Germany.

After Jerome Bonaparte had been compelled, in October 1813, to retire from Germany, and the Electorate of Hesse-Cassel had been restored to its former state, with the Elector at its head, Jacob Grimm was appointed in December 1813 Secretary of Legation, to accompany the Hessian minister to the head-quarters of the allied army; and in April 1814 he was sent to Paris, and employed in reclaiming the books which the French had carried away, at the same time that his future colleague Völkel was demanding the restitution of the pictures and other works of art. Jacob Grimm attended the Congress of Vienna as Secretary of Legation from October 1814 to June 1815. Soon after his return home he was again sent to Paris to demand restitution of manuscripts carried away from the kingdom of Prussia, as well as to transact some business for the Elector.

Wilhelm Grimm had been employed about a year in the library at Cassel, when in 1816 Jacob was engaged as second librarian, Völkel being first librarian. In 1828 Völkel died, and Jacob Grimm expected that he and his brother would receive the appointments of first and second librarians. When therefore the situation of first librarian was given to Rommel, historiographer and keeper of the archives, the brothers were dissatisfied; and in October 1829 they removed to the University of Göttingen, where Jacob Grimm received the appointments of professor and librarian, and Wilhelm that of sub-librarian. Having been one of the seven professors of the university who in 1837 signed a protest against the measures taken by the new King of Hanover to abrogate the constitution which had been established some years previously, Jacob Grimm was dismissed from his employments in the university, and banished from the kingdom of Hanover. He retired to Cassel, whither his brother, who had also signed the protest, followed him in 1838, and where they remained occupied in literary labours till March 1841, when they accepted an invitation of the King of Prussia to remove to Berlin, where they were both elected members of the Academy of Sciences, and appointed to professorships, which they still retain.

The works of Jacob Grimm are numerous. Speaking of them, he says, "All my labours have been either directly or indirectly devoted to researches into our ancient language, poetry, and laws. These studies may seem useless to many, but to me they have always appeared a serious and dignified task, firmly and distinctly connected with our common fatherland, and calculated to foster the love of it. I have esteemed nothing trifling in these inquiries, but have used the small for the elucidation of the great, popular traditions for the elucidation of written documents. Several of my books have been

published in common with my brother William. We lived from our youth up in brotherly community of goods; money, books, and collectanea, belonged to us in common, and it was natural to combine our labours." One of his earliest works was 'Ueber den Alt-Deutschen Meister-Gesang,' 8vo, Göttingen, 1811. His principal works are—'Geschichte der Deutschen Sprache' ('History of the German Language'), 2 vols. 8vo; 'Deutsche Rechtsalterthümer' ('German Legal Antiquities'), 8vo, Göttingen, 1823; 'Deutsche Mythologie,' 8vo, 1835; and his great work on German grammar, 'Deutsche Grammatik,' 4 vols. 8vo, Göttingen, 1826-37. He published an edition of 'Reinhart Fuchs,' accompanied by a preface, in which he discusses the characteristics of the fable-narrations of the middle ages, and afterwards addressed an epistle to Lachmann on the same subject, 'Sendschreiben an Lachmann über Reinhart Fuchs,' 8vo, Leipzig, 1840. He published a collection of 'German Axioms' ('Weisthümer'), 3 vols. 8vo, Göttingen, 1840-42; and a collection of 'Old Spanish Narrative Poems' ('Silva de Romances Viejos'). One of the most popular of the publications of the brothers is the 'Kinder und Haus-Märchen,' of which there are three or four English translations. Two of the latest are entitled 'Household Stories collected by the Brothers Grimm,' 2 vols. 8vo, 1853, and 'Home Stories, newly translated by M. L. Davis,' 8vo, 1855.

The Brothers Grimm have been for about three years employed on a large German Dictionary, which will be exceedingly valuable, and when completed may justly be regarded as a national work. It is entitled 'Deutsches Wörterbuch, von Jacob Grimm und Wilhelm Grimm,' 4to, 1852, &c.; the fourth number of the second volume, published in May this year (1856), extends to 'Der.'

* GRIMM, WILHELM CARL, was born at Hanover, on the 24th of February 1786. The leading facts of his life are stated in the preceding biography of his brother, Jacob Grimm. His publications consist for the most part of German poetry of the middle ages, such as that of 'Grave Ruodolf,' 'Hildebrandlied,' the 'Freidank,' the 'Rosengarten,' the 'Goldenen Schmiede,' and others. He published a translation into German of Old Danish Hero-Ballads ('Alt-Dänische Heldenlieder'), Heidelberg, 1811. His inquiry into the German Runic inscriptions ('Ueber Deutsche Runen,' Göttingen, 1821) is a very learned and curious investigation. He published an imitation of Crofton Croker's 'Fairy Legends of Ireland,' under the title of 'Irische Elfen-Märchen,' Leipzig, 1826, with an introduction on the belief in faeries.

GROCYN, WILLIAM, one of the revivers of literature, was born at Bristol in 1442, and received his early education at Winchester School. He was elected thence to New College, Oxford, in 1467, and in 1479 was presented by the warden and fellows of that society to the rectory of Newton Longueville, in Buckinghamshire. In 1485 he was made a prebendary of Lincoln, and in 1488 set out upon his travels into foreign countries. His great object was to obtain a thorough knowledge of the Greek language, which was then but little cultivated in England. Accordingly he went into Italy, where he studied for some time under Demetrius Chalcondylas, Politiano, and Hermolaus Barbarus. He returned to England, and fixed himself in Exeter College, Oxford, in 1491, where he took the degree of B.D. Here too he publicly taught the Greek language, and was the first who introduced a better pronunciation of it than had been before known in England. The cultivation of this language however in the university alarmed many as a dangerous innovation; and Wood informs us that the members became divided upon it into two factions, distinguished by the appellations of Greeks and Trojans. It was at this period that Erasmus visited Oxford, and resided during the greater part of his stay there in Grocyn's house. Erasmus, who mentions him with great and merited commendation, calls him 'patronus et preceptor.' In the course of his career Grocyn had one or two other preferments, and in 1506 became master of Allhallowes College, at Maidstone, in Kent, though he continued to live mostly at Oxford. He died at Maidstone in 1519, of palsy, with which he had been seized a year before. His will is printed in the Appendix to Knight's 'Life of Erasmus.' A Latin epistle of Grocyn to Aldus Manutius is prefixed to Linacre's translation of Proclus's 'De Sphæra,' at the end of the 'Astronomi Veteres' of 1499. The productions ascribed to him by Bale, Leland, and Tanner are not extant in print. (Knight, *Life of Erasmus*; Erasmii, *Epistolæ*, fol. Lugd. Bat., 1706, pp. 95, 294; Wood, *Athenæ Oxon.*, ed. Bliss, i., 30-32.)

GRONOVIVS, the Latinised form of Gronov, was the name of a family originally from Germany, but settled in Holland, several members of which distinguished themselves by their classical learning in the 17th and 18th centuries.

JOHN FREDERIC GRONOV, born at Hamburg in 1611, studied at Leipzig, Jena, and Altdorf; travelled through Holland, England, France, and Italy; was appointed professor of belles-lettres at Leyden in 1658. He died in 1671. He published editions of several of the classics, such as Livy, Sallust, Seneca, Pliny, &c. He wrote—'De Sestercis, seu Subsecoivorum Pecuniarum veteris Græcæ et Romanæ, libri iv.,' Deventer, 1643, republished with important additions by his son James Gronovius, Leyden, 1691; 'De Musæo Alexandrino Exercitationes Academicæ;,' 'Lectiones Platinae, quibus non tantum fabulæ Platinae et Terentianæ, verum etiam Cæsar, Cicero, Livius, illustrantur,' Amsterdam, 1740; and other works of classical erudition.

JAMES GRONOVIVS, elder son of the preceding, born at Deventer in 1645, showed from early youth a great aptitude for philological studies. He published numerous editions of the Greek and Roman classics, among others of Herodotus, Polybius, Macrobius, Aulus Gellius, Tacitus, &c.; but the work by which he is best known is the 'Thesaurus Antiquitatum Græcarum,' 13 vols. fol., Leyden, 1697, enriched with engravings of mythical and historical personages, of monuments and other remarkable objects illustrative of the arts, customs, and history of ancient Greece, copied from ancient sepulchres and medals, and disposed in order of time. He also published 'Geographi Antiqui,' 2 vols. 4to, Leyden, 1694. Gronovius, after travelling through various countries of Europe, was appointed by the Grand-Duke of Tuscany professor of belles-lettres in the University of Pisa. After two years he returned to Holland, in 1679, and filled the same chair, as professor in the University of Leyden, which his father had occupied before him. He died at Leyden in 1716. Gronovius, unlike his father, was fond of polemics, in which he was lavish of hard words and abuse. [FABRETTI.] Nicéron, in his 'Mémoires,' has given a list of all his works.

ABRAHAM GRONOVIVS, eldest son of James, a physician of some reputation, wrote also several works on subjects of classical erudition, such as 'Varia Geographica,' 8vo, Leyden, 1739, being a collection of dissertations and notes in illustration of ancient geography; he also published a good edition of Justinus, 8vo, Leyden, 1760, adding his own notes to those of his grandfather John Frederic Gronovius, of Ia. Vossius, Grævius, Fabri, and others, and subjoining a copious index.

LAURENTIUS THEOPHILUS GRONOVIVS, younger brother to James, published 'Emendations Pandectarum juxta Florentinum exemplar,' Leyden, 1685, which he dedicated to Magliabecchi, with whom both he and his brother had become intimate while in Italy. He also contributed to his brother's 'Thesaurus,' and to the 'Varia Geographica' of his nephew Abraham.

GROS, ANTOINE-JEAN, BARON, one of the most distinguished of the recent French painters, was born at Paris in 1771. He was a pupil of David, and some of his earlier pictures are in the dry manner of that painter. One of his first works of note was 'Bonaparte on the Bridge of Arcola,' in the celebrated battle of that place, exhibited at the Louvre in 1801. In 1804 he exhibited his celebrated large picture of the 'Plague of Jaffa,' with Bonaparte visiting the sick, to whom he has given a most disgusting appearance, though the whole displays great vigour and power: it is now at Versailles: there is a large print of it by Laugier. He painted also several other large pictures, as—the 'Battle of Aboukir;' the 'Battle of the Pyramids;' 'Napoleon visiting the Field of Eylau, after the Battle;' the 'Battle of Wagram;' the 'Capture of Madrid by Napoleon;' and other subjects from the history of France during the eventful years of the early part of this century. His masterpiece, however, is considered to be the 'Cupola of St. Geneviève,' at Paris, executed in oil, in 1824, and for which he was created Baron; it exhibits the saint as guardian of the throne of France, which is represented by Clovis, Charlemagne, St. Louis, and Louis XVIII.: but though gorgeous and effective, it belongs strictly to the school of ornamental art; the drawing is correct, and the colouring is florid, but the composition and expression are very ordinary.

The pictures of Gros generally are conspicuous for vigour and facility of execution, but they are at the same time extremely coarse, sometimes in treatment as well as handling; they show little or no delicacy of feeling, and they are void of all pictorial refinement of tone and modelling, and are equally void of sentiment. Perhaps 'Sappho leaping from the Promontory of Leucate,' on the island of Leucas, may be considered an exception to his prevailing style: there is a good print of it by Laugier. His picture also of the 'Visit of Francis I. and Charles V. to the Abbey of St. Denis' is executed in a very superior style to his battle-pieces and similar large works: it has been admirably engraved by Forster. This and the 'Battle-field of Eylau' are in the Louvre. Gros has painted also some excellent portraits.

He died at Paris, June 26, 1835. He was professor of painting at the École Royale des Beaux Arts; member of the Institute; officer of the Légion d'Honneur; and knight of the order of St. Michel.

GROSE, FRANCIS, an eminent English antiquary, was the son of Francis Grose, a native of Switzerland, who, settling in England, followed the trade of a jeweller, and was employed as such in fitting up the crown for the coronation of King George II. Francis Grose the younger was born at Greenford in Middlesex, according to Noble; Chalmers says in 1731. His taste for heraldry and antiquities induced his father, at an early period, to procure a place for him in the Herald's College, where he received the appointment of Richmond Herald, a post which he resigned in 1763, when he became adjutant and paymaster of the Hampshire militia. At a subsequent time he was a captain in the Surrey militia. His father, who died in 1769, left him an independent income, which he had unfortunately neither the disposition to increase nor the prudence to preserve. Whilst paymaster of the Hampshire militia, he used jocosely to say that he had only two books of accounts, his right and left hand pockets. In the one he received, and from the other paid. Designing persons, of course, regarded him as their dupe: and he soon felt the effects of his credulity. His losses however roused his latent talents. To a good education he united a taste for drawing, which he now began again to

cultivate, and, encouraged by his friends, he undertook a work from which he derived both profit and reputation. He began to publish his 'Views of Antiquities in England and Wales,' in 1773, in numbers, and finished them in 1776. In 1777 he resumed his pencil, and added two more volumes to his 'English Views,' in which he included the islands of Guernsey and Jersey. In the summer of 1789 he set out on a tour to Scotland, the result of which he began to communicate to the public in 1790, in numbers: but before he had concluded this work, in the spring of 1791, he went to Ireland, intending to furnish that kingdom with views and descriptions of her antiquities in the same manner in which he had done those of Great Britain: but soon after his arrival in Dublin, at the house of a Mr. Hone, he was suddenly seized at table with an apoplectic fit, on May 12th, and died immediately.

Captain Grose's other publications were, a 'Treatise on Antient Armour and Weapons,' 4to, 1785, to which he added a Supplement, 4to, 1789; a 'Classical Dictionary of the Vulgar Tongue,' 8vo, 1785; 'Military Antiquities,' 2 vols. 4to, 1786-88; the 'History of Dover Castle,' by the Rev. William Darell, 4to, 1788; 'Rules for Drawing Caricatures,' 8vo, 1788; and a 'Guide to Health, Beauty, Honour, and Riches; a collection of numerous advertisements, pointing out means to obtain those blessings,' 12mo. The 'Olio,' a collection of essays, and other small pieces highly characteristic of Mr. Grose, and bearing his name, but certainly not made entirely by him, was published in 8vo, 1793. The 'Antiquities of Ireland' were completed by Mr. Ledwich, and published in 2 vols. 4to. and 8vo, 1794. His antiquarian works display but very insufficient qualifications, either in learning or acumen, for the task of elucidating obscure subjects. Those who knew Captain Grose say that his literary acquirements were far exceeded by his good-humour, his conviviality, and his friendship. In person he was remarkably corpulent.

*GROTE, GEORGE, was born in 1794, at Clay-Hill, near Beckenham, in the county of Kent. His grandfather, descended from German ancestors, founded, in partnership with Mr. George Prescott, the London banking establishment of Prescott, Grote, and Co. Mr. Grote was educated at the Charter House School, London, and in 1809 commenced his course of instruction as a banker by being employed as a clerk in his father's house of business. All his leisure time however, not only in the evening, but in the hours of early morning, was assiduously devoted to literature and to the study of economic science with Mr. Mill, and other gentlemen of the liberal class of politicians, with whom he had formed an acquaintance. In 1821 he published anonymously a pamphlet on parliamentary reform, in reply to an article by Sir James Mackintosh in the 'Edinburgh Review;' and he afterwards wrote a small work on the 'Essentials of Parliamentary Reform.' He has also written some articles in the 'Westminster Review.' He began to collect materials for his great work, the 'History of Greece,' in 1823, but the political excitement of the years 1830 and 1831 drew him into public life; and for nine or ten years his literary labours were greatly interrupted. In 1832 he was elected a member of parliament for the city of London, and was re-elected till 1841, when he resigned his seat in order to devote his time to the completion of his historical work.

On the 25th of April 1833, Mr. Grote made a motion in the House of Commons, "that it is expedient that in future elections of members to serve in parliament, the votes be taken in the way of ballot." The motion was negatived by 211 to 106. He took the lead in support of the principle of the ballot, and defended it by very powerful reasoning on a motion which he made in the House of Commons every session as long as he continued to be a member. His motion made on the 18th of June 1839 was negatived by 333 to 216. Mr. Grote's political principles were very decidedly liberal, and when he spoke, which he did occasionally at considerable length, he was always listened to with the greatest attention.

Mr. Grote's 'History of Greece' commences with the earliest period of heroic legends. Vols. I. and II. were published early in 1846. Vol. XII. (with portrait, maps, and index), published in 1856, completes the work, and terminates with the death of Alexander the Great, B.C. 323, which, in Mr. Grote's view, is the close of Grecian history properly so termed. For extent of research, critical skill, novelty and independence of thought, comprehensiveness of view, and soundness of judgment, it is one of the most important works in English historical literature. That the work is equally appreciated out of England is shown by its having been translated into German.

GROTIUS, HUGO, was born at Delft, 10th April 1583, of which town his father, John de Groot, was burgomaster, and also curator of the then newly established University of Leyden. From his boyhood Grotius manifested an extraordinary ability, and he is said to have written Latin verses when he was only eight years old. At the age of eleven he was sent to the University of Leyden, where his education was particularly superintended by the theologian Junius, with whom he lived, and by Joseph Scaliger. He remained three years at Leyden, during which he applied himself to the study of divinity, law, and mathematics. In 1597 he maintained two public theses on philosophy, and wrote in praise of Henri IV., in Latin, a poem entitled 'Triumphus Gallicus,' which he dedicated to M. de Busenval, the French ambassador in Holland. In 1598 he accompanied a Dutch embassy to Paris, where he was introduced to the king, who gave him a

golden chain, and presented him to his court as the miracle of Holland. After one year's stay in France, where he was treated with much distinction by many eminent personages, he returned to Holland, whence he addressed a letter to Thuanus (De Thou), expressing his regret at having missed an opportunity of making his acquaintance when in France. This letter laid the foundation of a literary and friendly correspondence, which lasted till the death of Thuanus. In the same year (1599) he published an edition of Martians Capella, with notes, which he dedicated to the Prince de Condé. This edition is adorned, besides a portrait of the Prince de Condé, with that of Grotius himself, aged fifteen, wearing the chain which he had received from Henri IV. Immediately on his return from France, Grotius was called to the bar, and pleaded with great success; but his legal occupations did not prevent him from attending to other studies. In the same year (1599) he published a Latin translation of a nautical work, written by Stevinius, at the request of the Prince Maurice of Nassau, for the use of naval officers. In 1600 appeared his edition of the 'Phænomena' of Aratus. The corrections he made in the Greek text are considered to be very judicious, and his notes show some knowledge of Arabic. Notwithstanding these serious studies, Grotius found time for cultivating poetry, and with such success, that he was considered one of the best Latin poets of his time. The 'Proseopoeia' of the city of Ostend, which had sustained a siege of three years, was universally considered a masterpiece, and was translated into French by Rapin, Pasquier, and Malherbe, and into Greek by Isaac Casaubon.

Grotius was nominated advocate-general for the treasury of Holland and Zealand in 1607, and in the next year married Mary Reygersburgh, a lady of great family in Zealand. In 1613 he was made pensionary of Rotterdam, an important place which gave him a seat in the assembly of the states of Holland, and afterwards in that of the states-general, and it was about that time that he contracted an intimate friendship with Olden Barneveldt, a connection which exercised the greatest influence on his life. In 1615 Grotius was sent to England in order to arrange the difficulties arising from the claims of the English to exclude the Dutch from the whale-fisheries of Greenland. During that negotiation, Grotius was by no means satisfied with the English ministry, but he was much pleased with his reception by King James. The most agreeable incident of his visit to England was however the opportunity which it afforded him of forming an intimate friendship with Isaac Casaubon, in common with whom he entertained a hope of uniting all Christians into one church.

The intimacy of Grotius with Barneveldt, whose political and religious opinions he shared, involved him in the misfortune of his friend. [BARNEVELDT; ARMINIUS.] He was condemned on the 18th of May 1619 to perpetual imprisonment, and his property confiscated. Pursuant to this sentence, he was conveyed on the 6th of June in the same year to the fortress of Loevestein, situated at the extremity of an island formed by the Maas and the Waal. His wife was allowed to share her husband's imprisonment, but Grotius's father was refused permission to see his son. During the imprisonment of Grotius study became his consolation and the business of his life. In several of his letters addressed from Loevestein to Vossius, he gives an account of his studies, informing him that he was occupied with law and moral philosophy. He devoted his Sundays to reading works on religious subjects, and he employed in the same way the time which remained after his ordinary labours were over. He wrote during his imprisonment his treatise on the truth of the Christian religion, in Dutch verse (which he subsequently translated into Latin prose), translated the 'Phœnissæ' of Euripides into Latin verse, wrote the institutions of the laws of Holland in Dutch, and drew up for his daughter Cornelia a kind of catechism in 185 questions and answers, written in Flemish verse. After eighteen months' confinement, Grotius was at last released by the ingenuity of his wife, who had obtained permission to go out of the prison twice a week. He constantly received books, which were brought in and taken out in a large chest together with his linen. For some time this chest was strictly examined by the guards, but finding only books and foul linen, they at last grew tired of the search, and gave it up. Grotius's wife having observed this, persuaded her husband to get into the chest, which he did, and in this manner escaped from the fortress on the 21st of March 1621. He made his way through Antwerp to France, where his wife, who had been detained for about a fortnight in prison, joined him a few months afterwards.

Louis XIII. received Grotius very favourably, and granted him a pension of 3000 livres, but it was paid with great irregularity. He was harshly treated by the Protestant ministers of Charenton, who, having assented to the doctrines of the synod of Dordrecht, refused to admit Grotius into their communion, and he was obliged to have divine service performed at home. At Paris (1622) he published his 'Apology,' which was prohibited in Holland under severe penalties. Having spent a year at Paris, he retired to a country-seat of the president De Mesmes, near Senlis, where he spent the spring and summer of 1623. It was in that retreat that he commenced his work 'De Jure Belli et Pacis,' which was published in the next year.

During his residence in France he was constantly annoyed with importunities to pass over to the Roman Catholic religion; but

though he was tired of the country, and received invitations from the Duke of Holstein and the King of Denmark, he declined them. Gustavus Adolphus also made him offers, which, after his death, were repeated by Oxenstiern in the name of queen Christina. In the meantime the stadholder Maurice died, and his successor seeming less hostile to Grotius, he was induced by the entreaties of his Dutch friends to venture to return. He arrived at Rotterdam in September 1631, and the news of his return excited a great sensation throughout all Holland. But in spite of all the efforts of his friends he was again obliged to leave the country, and went (1632) to Hamburg, where he lived till 1634, when he joined the chancellor Oxenstiern at Frankfurt-on-the-Main, who appointed him councillor to the queen of Sweden, and her ambassador at the court of France. The object of the embassy was to obtain the assistance of France against the emperor. Grotius arrived at Paris in March 1635; and although he had many difficulties to encounter from Richelieu, and afterwards from Mazarin, he maintained the rights and promoted the interests of his adopted sovereign with great firmness. He continued in his post till 1644, when he was recalled at his own request. Having obtained a passport through Holland, he embarked on his return at Dieppe, and on his landing at Amsterdam (1645) was received with great distinction and entertained at the public expense. From Amsterdam he proceeded by Hamburg and Lübeck to Stockholm, where he was received in the most flattering manner by the queen. Grotius however was not pleased with the learned flippancy of Christina's court, and resolved on quitting Sweden. The climate also did not agree with him. The queen, having in vain tried to retain him in her service, made him a present of a large sum of money, and of some costly objects; she also gave him a vessel, in which he embarked for Lübeck on the 12th of August, but a violent storm, by which his ship was tossed about during three days, obliged him to land on the 17th in Pomerania, about 15 leagues from Danzig, whence he proceeded towards Lübeck. He arrived at Rostock on the 26th, very ill from the fatigues of the journey, and from exposure to wind and rain in an open carriage; he died on the 28th of August 1645, in the sixty-third year of his age. His last moments were spent in religious preparation, and he died expressing the sentiments of a true Christian. His body was carried to Delft and deposited in the grave of his ancestors, where a monument was erected to him in 1781. Two medals were struck in honour of him.

Notwithstanding his stormy life, the works of Grotius are very numerous. They treat of divinity, jurisprudence, history, literature, and poetry. Many of them are become classical. They may be distributed as follows:—1. His 'Opera Theologica,' which were collected by his son Peter Grotius, 4 vols. 4to, Amsterdam, 1679, contain, in the first volume, his commentaries on the Holy Scriptures, but particularly on the Gospels. Leibnitz said of them ('Opera,' vol. vi. p. 226) that he preferred Grotius to all the commentators. 2. The treatise, 'De Veritate Religionis Christianæ,' which has been translated from the Latin of Grotius into many European, and even into some Oriental languages. An Arabic translation was published at Oxford (1660), with notes by Edward Pococke. 3. A treatise in Latin, 'On the Atonement,' written against Socinus, in order to vindicate the Remonstrants from the charge of Socinianism; translated into English, and published at London (1692) under the title, 'Defence of the Catholic Faith concerning the Satisfaction of Christ,' translated by W. H. 4. 'Via ad Pacem Ecclesiasticam,' and several other treatises, amongst which the most remarkable is 'Philosophorum Sententiæ de Fato et de eo quod in nostra est Potestate.' Among his works on jurisprudence, his treatise 'De Jure Belli et Pacis' is translated into all the European languages, and has long been adopted by many universities as an elementary book for the study of international law. It seems however that the author wrote it rather for the use of sovereigns and ministers than for students. It was a favourite book of Gustavus Adolphus, and he always carried it with him. 2. 'Florum Sparsio ad Jus Justinianum,' Paris, 1642. 3. 'Introduction to the Jurisprudence of Holland' (in Dutch), at the Hague, 1631. 4. 'Mare Liberum,' a treatise against the claims of the English to exclusive right over certain seas. It was answered by Selden in his 'Mare Clausum.' 5. 'De Imperio Summarum Potestatum circa Sacra,' Paris, 1646; reprinted at Naples, 1780, 'Cum Scholiis Criticis et Chronologicis.' 6. A collection of legal consultations, opinions, &c.

His principal historical works are:—1. 'Annales et Historiæ Belgicæ usque ad Inducias Anni 1609, lib. xviii.'—it appeared after his death, at Amsterdam, 1657, in fol; 2. 'De Antiquitate Reipublicæ Batavicæ,' Leyden, 1810, 4to; 3. 'Parallela Rerumpublicarum,' which he left in manuscript, and of which only a fragment was published in 1801, at Leyden, by Baron Meerman; 4. 'De Origine Gentium Americanarum,' Paris, 1642 and 1643, 8vo; 5. 'Historia Gothorum, Vandalorum, et Longobardorum,' published after his death, Amsterdam, 1655.

His Latin poems, which were collected and published for the first time by his brother, William Grotius, at Leyden, in 12 vols., went through ten editions before that of Amsterdam, 1670. Three tragedies:—1. 'Adamus Exul,' published at Leyden in 1601, on the same subject as the 'Paradise Lost'; 2. 'Christus Patiens,' printed at Leyden 1608, and translated into English by George Sandys under the title of 'Christ's Passion,' with annotations, London, 1640, a translation with which the author was much pleased; the third of his tragedies is

entitled 'Sophomaneas' (which signifies in Egyptian 'Saviour of the World'). The subject is the history of Joseph in Egypt. It was also translated into English by Francis Goldsmith, London, 1652. Besides these tragedies he left many poetical compositions in Latin, of the lyrical, elegiac, and epigrammatic kind, as well as many translations from the Greek poets into Latin verse. Grotius wrote some pieces of poetry in Greek, and several Dutch poems, which are much esteemed by his countrymen. His letters have gone through many editions, of which the last is that of Amsterdam, 1809. 'The Life of the Truly Eminent and Learned Hugo Grotius,' containing a copious and circumstantial history of the several important and honourable negotiations in which he was employed, together with a critical account of his works, written originally in French by M. de Burigny, appeared at London in 1754. 'The Life of Hugo Grotius, with Brief Minutes of the Civil, Ecclesiastical, and Literary History of the Netherlands,' by Charles Butler, Esq., of Lincoln's Inn, London, 1826, is not equal to Burigny's work.

GROTIUS, WILLIAM, was born in 1597 at the Hague. He was the younger brother of Hugo Grotius, who directed his studies, and always behaved towards him with the greatest kindness. William Grotius became a learned and prosperous lawyer. He died at the Hague in 1662.

William Grotius collected and published at Leyden, in 1617, the Latin poems of his brother in 12mo. He himself wrote:—'Isagoge ad Praxin Fori Batavici,' Amsterdam, 1655, 4to; 'Enchiridion de Principiis Juris Naturalis,' Hague, 1667, 4to; 'Vitæ Jurisconsultorum quorum in Pandectis extant Nomina,' Leyden, 1690, 4to.

GROUCHY, EMMANUEL, COMTE DE, Marshal and Peer of France, was born in Paris, October 23rd, 1766. He entered the artillery branch of the army in 1780. He was already a captain of horse in 1784, and in the course of the ensuing year, became one of the *garde-du-corps* of Louis XVI. However, no sooner did the first dawn of the Revolution appear than he quitted the *garde-du-corps* and ardently embraced revolutionary principles. In 1792, he was made colonel of the 2nd regiment of dragoons, a few months later he became major-general, and was appointed to head the cavalry attached to the army of the Alps. In that campaign Savoy was conquered by Montesquieu and annexed to France, General Grouchy having mainly contributed to its reduction.

Though scarcely in his 27th year, he began already to be esteemed the first cavalry officer in the French armies. In 1793, he was ordered to join the army of the *Côtes de Brest* in La Vendée, relieved Nantes, besieged by Charette, and by his skilful manœuvres at the head of the vanguard in the left wing he arrested the progress of the insurrection, preventing at one time, and rendering abortive at another, the repeated attempts of the royalists to open a communication with the English. At the battle of Sarrinières, in a critical moment, seeing the republican infantry waver, Grouchy leapt from his horse, placed himself at the head of a few hundred grenadiers, charged the Vendéans, and in spite of a wound he received, wrested the victory from them. In December 1793, on account of his noblesse, he was removed from his command; but his soldiers having heard of his intended departure, flocked to his quarters to prevent it, and Grouchy had to rebuke their attachment, and recal them to obedience. Shortly afterwards the army of the insurgents having crossed the Loire, and approached the district in which he was residing, Grouchy mingled in the ranks of the National guards as a private soldier, and assisted in repulsing the enemy. His retirement lasted but eight months. In September 1794, Carnot gladly restored him to his dragoons; and on the 11th of June 1795, confirmed him in his post of general of division, to which the soldiers themselves had raised him. Carnot, shortly after, offered him the command of the army of the *Côtes de Brest*. The republic had, at this juncture, three armies operating against the royalists, and Grouchy feeling that a divided command would injure the service, declined the offer, and recommended that General Hoche should be placed at the head of the three armies. This was done. Grouchy took service under Hoche, and defeated Charette in his intrenchment at Saint-Cyr; and soon after the Vendean chiefs, Charette and Stafflet, were taken prisoners. At the beginning of 1797, Grouchy was appointed second in command of the army under Hoche, intended to invade Ireland, but the French fleet having been dispersed by a tempest, was compelled to regain the coasts of France. Early in 1798, he was ordered to Italy to join Joubert's army, shortly after commanded by Moreau, under whom, and at the head of a few troops, he took part in that celebrated campaign of Piedmont, where during six weeks 25,000 French soldiers held their ground and manœuvred in presence of the Austro-Russian army of 80,000 men. Grouchy afterwards distinguished himself at the battles of Valence and San Julian; and on the 14th of June 1799, he defeated General Bellegarde on the banks of the Bormida. At the battle of Novi, in which Joubert was killed, Grouchy shared with Pérignon the command of the left wing, took 1200 Austrian prisoners, and charged the enemy eleven times at the head of his dragoons; but being placed between two fires, he fell from his horse, with fourteen wounds, and was taken by the Austrians. The Grand-Duke Constantine sent his own surgeon to attend him, ordered his servants to wait upon him, and offered him a liberal sum of money. After his recovery and exchange, Moreau, anxious to mark his sense of Grouchy's services, put him at the head

of his grand division, consisting of 18,000 troops. At the battle of Hohenlinden, in 1800, he took fourteen pieces of artillery, and greatly assisted in obtaining the victory.

During the trial of Moreau, in 1804, Grouchy stood by the side of his leader, and gave him continual proofs of esteem and friendship. At the battle of Zenedick, Grouchy, at the head of his dragoons, routed the Prussian horse, pursued the fugitives for nine miles, and utterly destroyed the famous regiment of the Queen of Prussia. After the combat of Prenzlau, October 27, 1805, he pursued the enemy into the town, and compelled several battalions to ground their arms. The dismay produced by this exploit, obliged the prince of Hohenlohe to sign a capitulation by which 16,000 men, 64 pieces of artillery, and great stores of ammunition were given up to the French. General Grouchy shortly after, meeting the Prussians near Lubeck, drove them through the town, and well nigh captured Blucher. In the heat of the battle of Friedland, June 14, 1807, he was again grievously wounded, on which occasion his conduct was observed by the emperor, who gave him the grand cordon of the legion of honour. Throughout the Russian campaign, in 1812, his courage and intrepidity were conspicuous, and when Napoleon formed his sacred battalion, consisting of none but officers, whose duty was to watch over him, the command of this chosen band was given to General Grouchy. This was, perhaps, the greatest act of real confidence ever shown by Napoleon to a general officer; yet, in 1813, the Emperor refused Grouchy's application for the command of a corps, and for a time he abandoned the service. But the following year, when France was invaded, he offered his services, and Napoleon gave him the command of his cavalry. His name now appeared in almost every battle, at Brienne, January 26, 1814, at La Rothière, February 1, and at Vauchamps, February 14. His bravery and skill, at this last battle, rang through all France; the anger of Napoleon, which had lasted ten years, gave way before it, and Grouchy was created a Marshal.

After the battle of Ligny, June 16, 1815, Marshal Grouchy was commissioned to pursue the retreating army of Blucher with a force of 34,000 cavalry, and 100 pieces of cannon. In consequence of these orders, he found himself posted at Wavre, and was engaged in action against the Prussian general Thielemann, whilst Napoleon was fighting at Waterloo, on the 18th. The marshal heard the report of artillery, and was strongly urged by his lieutenant-generals to march towards the point whence it proceeded; but he declared himself bound to obey the orders he had received from the emperor on the 17th. Fatal as the battle of Waterloo proved to the French arms, nothing was publicly said at that period against Grouchy's conduct, nor for three years after. After the second abdication of Napoleon, the Provisional government appointed the marshal to the united command of all the corps of the Grand army; but the entire muster only amounted to 45,000 men.

Banished from France, after the return of Louis XVIII, he withdrew to the United States, where he was living in 1818, when the narrative of the battle of Waterloo, dictated to General Gourgaud, at St. Helena, was published. In this account a charge of treachery was made for the first time against him. Grouchy returned to France, in 1819. He was reinstated in all his titles and honours in 1831, by Louis Philippe, and died at Saint-Etienne, May 29, 1847, having been sixty-seven years in the French armies.

GRUTER, JOHN, an eminent scholar and critic, was born at Antwerp, December 3, 1560. He may be esteemed half an Englishman, being of an English mother, learned and able, who is reported to have been his childhood's chief instructor. Moreover, his family being Protestant, and driven from Antwerp on account of their religion, he spent his boyhood in England, and studied several years at Cambridge, which he quitted to go to Leyden at the age of nineteen. His biography, as to dates and places, is not clearly made out. His first academic employment was at Wittemberg, as professor of history. This he left, rather than compromise his adherence to the Protestant religion. The professorship of *belles-lettres* at Padua, a place of much emolument, he declined on similar considerations. In 1602 we find him a professor at Heidelberg but know not in what branch of learning: he had also the direction of the public library. He himself made a very valuable collection of books, at the expense of 12,000 crowns, which was lost in the sack of Heidelberg by Tilly in 1622. After this he received invitations from several universities, none of which were accepted. He continued to reside near Heidelberg until his death, September 20, 1627.

Gruter was more remarkable for industry than for brilliancy of talent: it is said that he published a book almost every month, which, of course, is an exaggeration; but any one of whom this could be said, must have published a great deal not worth remembering. The catalogue of his works in Niceron (v. 9) extends only to thirty-two. It includes editions of, or notes on, Seneca, Statius, Martial, Tacitus, Vell. Paternulus, Florus, Livy, Sallust, Pliny, Onosander, Panegyrici Veteres, Historiæ Augustæ Scriptores, Latini Minores, Cicero, and Publius Syrus. His chief work was 'Inscriptiones Antiquæ totius Orbis Romani,' Heidelberg, 1601: a repository of all then known inscriptions, which alone, it has been said, would be enough for the glory of Gruter. The original work however is superseded by a second edition, by Grævius, Amat, 1707, 4 vols., fol.: 'Lampas,' 6 vols. 8vo., 1602, deserves mention as a collection of rare or unpublished critical notices on all manner of subjects, by various

persons, which might probably have perished in their scattered state. (Nicéron, *Mémoires pour servir*, &c. vol. ix. ; Bayle.)

GUARINI, GIOVANNI BATTISTA, was born at Ferrara in 1537, of a family which had produced several distinguished men of letters. His ancestor Guarino of Verona was one of the restorers of Greek studies in Italy. He died at Ferrara in 1460, leaving a son, Giovanni Battista Guarini, who was many years professor of belles-lettres at Ferrara, where he died in 1494, and left several works; among others a dissertation 'De Secta Epicuri,' and another, 'De Ordine docendi et studentii.' Guarini, the subject of the present article, after receiving a careful education was taken into the service of his sovereign Alfonso II., duke of Ferrara, who sent him on several missions as his ambassador to Venice, Rome, Turin, and also to Germany and Poland. In 1582 Guarini retired to his villa near Rovigo, where he applied himself to his studies and to his domestic affairs, which were much impaired by the expenses attending his various journeys. After four years he was recalled by Alfonso, who appointed him secretary of state; but Guarini soon after resigned again, and passed into the service first of the Duke of Savoy, and afterwards of Vincenzo Gonzaga, duke of Mantua. In 1590 he was once more recalled to Ferrara, and restored to Alfonso's favour. In 1592, Alfonso having died, and Ferrara being taken possession of by the pope, Guarini offered his services to Ferdinand de' Medici, grand duke of Tuscany, by whom they were readily accepted; but having some time after quarrelled with him also, he passed into the court of Francesco Maria, duke of Urbino. Becoming dissatisfied here also, he left the Duke of Urbino, and went to Rome, Ferrara, and lastly to Venice, where he died in October, 1612. He often complained of the trammels, jealousies, and ingratitude of courts; and yet, although he was not destitute of the means of independence, he could not live away from courts, and after repeatedly quitting in dudgeon one prince, he looked about for another to take him into his service. Guarini wrote poetry of various kinds: the most celebrated of his compositions is his 'Pastor Fido,' (the faithful swain), a pastoral drama, which was performed with great splendour at Turin on the occasion of the marriage of Charles Emanuel, duke of Savoy, with the infanta Catharine of Spain. It was published for the first time at Venice, in 1590, ten years after the publication of Tasso's pastoral drama, the 'Aminta.' The two dramas however, are very different, that of Guarini being more complicated in its plot, and more elevated in its sentiments and style; perhaps too much so for a composition called pastoral. But Guarini's shepherds are in fact men of the world and smart reasoners. The greatest charm of the poem is in the softness and fluency of its versification. It is said that the author spent many years in touching and retouching his work. It must also be observed that the 'Pastor Fido' contains some loose passages and immoral sentiments. The beauties and the faults of this production have been commented upon by a host of critics, the titles alone of whose works fill up a whole chapter of Fontanini's 'Biblioteca dell' Eloquenza Italiana,' vol. i. class 4, chap. 5. Some of these commentaries, with the name of Verrato, or Verato, in defence of his poem, were written by Guarini himself. The 'Pastor Fido' went through more than thirty editions in Italy alone; it was performed with applause in the different Italian cities, and has been translated into almost every language of Europe. Guarini wrote also a number of madrigals, and other specimens of lyric poetry. His works were collected and published in 4 vols. 4to. Venice, 1737.

GUBBIO, ODERIGI DA, a famous painter of the latter half of the 13th century, was a native of Gubbio or Agobbio, near Perugia. He resided in Rome, where he was the friend of Giotto, and of Dante, who mentions him (Purgatory, Canto xi.) as "L'onor d'Agobbio, e l'onor di quell' arte, che alluminar o chiamata a Parisi" (Glory of Agobbio, and glory of that art, which is termed at Paris the illuminator's); he also resided at Bologna, where he instructed Franco, the oldest of the Bolognese painters. He is said to have likewise practised and taught his art in his native place. Balducci endeavours to show that he was a pupil of Cimabue, but this seems improbable. He was chiefly celebrated as a miniature and missal painter, but he appears to have also painted with success in fresco. He died about or shortly before 1300.

* GUDIN, THEODORE, the most celebrated living French marine painter, was born at Paris, Aug. 15, 1802. He became a pupil of Girodet Trioson (GIRODET, TRIOSON), on leaving whom however he directed his attention exclusively to marine and landscape painting, which he practised both in oil and water colours. He first exhibited at the Salon in 1822; in 1824 he obtained the second-class medal (marine); and in 1827 the government recognised his merit by naming him Chevalier of the Legion of Honour. But the picture which secured his celebrity, was his 'Sauvetage des Passagers du Columbus,' which was exhibited at the Salon in 1831, and is now in the Museum at Bordeaux. A still more powerful production was his 'Coup de Vent dans la rade d'Alger,' exhibited in 1835, and which being purchased by the government, is now in the Luxembourg. When Louis Philippe resolved to carry on the decorations of the interior of Versailles, Gudín, as the most eminent in his line, was commissioned to paint the principal events in the naval history of France; and from 1835 to 1848, when his labours were brought to a sudden termination by the Revolution of February, his facile pencil produced for the galleries of

that palace no less than sixty-three marine paintings, chiefly battle-scenes, many of them of considerable size. Constant employment, and the eagerness manifested to possess his pictures, produced however an ill influence upon his style. Always somewhat peculiar and affected in style, with a tendency to the melodramatic, he now grew to be negligent of details, loose and slovenly in touch, outré in composition, and more and more artificial in colour; until he seemed to have lost all regard for the simplicity and amenity of nature, even in his mere views of places. A few years ago M. Gudín visited this country, and stayed some time in Scotland, and his 'Coast Scenes near Aberdeen,' 'Moonrise on the Aberdeen Coast,' the 'Banks of the Don,' &c., are among the most strongly pronounced examples of his later and more artificial manner. Even more exaggerated in style however were some pictures he painted a few years ago in a class differing somewhat from that which he usually practises, such as 'L'Incendie du Faubourg de Péra,' 'La Plage d'Afrique,' &c. More pleasing in style are his earlier scenes on the coast of France and Holland; and with all their peculiarities, his views of Caen, Grenoble, &c. M. Gudín was created an Officer of the Legion of Honour in 1841, and received a medal of the first class at the Exposition of 1855.

GUELPHS AND GHIBELINES, the names of two great political parties which divided Italy and Germany during the middle ages, became first known as the watchwords of their respective adherents at the battle of Winsberg, in Suabia, between two rivals for the Imperial throne, Conrad, duke of Franconia, and Henry the Lion, duke of Saxony, of the house of Welf, or Wolf. Welf, who was young Henry's uncle, fought on behalf of his nephew, and his name was the war-cry of his followers; whilst those of Conrad took for their rallying word the name of Weiblingen, a town of Würtemberg, and the patrimonial seat of the Hohenstauffen family, to which Conrad belonged. [CONRAD III.] In the course of time the name of Guelphs was given to all who were disaffected to the Emperor, and that of Ghibelines to the supporters of the Imperial authority; and as the popes, reviving their old rivalry with the empire, encouraged and supported the disaffected Guelphs, they became at last the leaders of that party, and the Italian cities were divided between the adherents of the popes and those of the emperors. The names of Guelphs and Ghibelines were not however generally adopted in Italy till the reign of Frederick II., when Italy was divided, as it were, into two camps; some cities, such as Florence, Milan, Bologna, ranging themselves on the Guelph side, while Pisa, Arezzo, Verona, and others, remained Ghibeline. But in the long struggle that ensued many alternate changes took place in each city, where sometimes the Guelphs and sometimes the Ghibelines gained the upper hand. Most of the powerful nobles in northern Italy, the Visconti, Doria, Della Scala, Pelavicino, were Ghibelines; the Anjou dynasty, which the popes had called to the throne of Naples, were the main support of the Guelphs. As the emperors, engrossed by their German affairs, neglected and dropped their hold upon Italy, the names of Guelph and Ghibeline lost their original meaning, and the struggle became one of personal or municipal ambition among the Italians themselves, the Ghibelines being for the most part animated by a spirit of aristocracy, the Guelphs professing to be favourers of a popular form of government. [DANTE.] But even this distinction was often belied by facts, and the leaders of the Guelphs in some towns tyrannised over their countrymen; whilst in some instances, as at Genoa, the Ghibelines formed really the popular party. In the 15th century the names of Guelphs and Ghibelines had become a mere traditional shadow, and at last the popes themselves united with the emperor in extinguishing the independence of the Italian republics, without distinction of parties. (Sismouidi, 'History of the Italian Republics;' Raumer, 'Geschichte der Hohenstauffen.')

The House of Brunswick, being descended from both the houses of Este and Welf, once allied by marriage, assumes the name of Este-Guelph.

GUERCINO (properly GIOVANNI FRANCESCO BARBIERI), was born in the year 1590 at Cento, a village near Bologna, belonging to the province of Ferrara. He gave very early proof of his talents by painting the figure of the 'Virgin' on the front of his father's house when he was only ten years of age. He studied under his countrymen Cremonini and Benedetto Gennari, and some accounts of him have adopted a tradition of his having been a pupil of the Caracci; but, not to mention other circumstances which render it improbable that he ever belonged to that school, it is observable that of three different manners which he successively adopted, no one bears any traces of the precepts of that celebrated academy. In his first style, which is the least known, he followed the manner of Michel Angelo da Caravaggio, with bright lights, deep shades, a yellowish tone of the flesh, producing a very powerful but not always natural effect. His second style, which is the best and most esteemed, was formed on the results of his observation, the study of the Roman, Venetian, and Bolognese schools, by his connection with the most eminent scholars of the Caracci, and the personal friendship of Caravaggio. In this style he still retained the striking effects of light and shade in which he followed Caravaggio, but greatly excelled him in elegance and dignity of feature, especially in his female figures; his men being, in general, little superior to the model he had before him. He established an academy at Cento in 1616, well furnished with models and antiques, to which numerous disciples soon resorted, for whose improvement he showed the greatest

solicitude, and treated them with uniform kindness and indulgence. He frequently visited the principal cities of Italy, where he met with ample employment, and as he designed and worked with great readiness and facility, his productions were very numerous. His fixed place of residence however was Cento, where he remained till the death of his friend and competitor Guido Reni, when he removed to Bologna. The general applause which the public lavished on the works of Guido induced him to adopt a third style, in which he endeavoured to attain the suavity of manner of that artist; but though he sometimes succeeded, yet on the whole his works in this third style are inferior to those of the second, being deficient in the stamp of originality, for the want of which no imitation, however successful, can compensate.

Guercino died at Bologna in 1666, in the seventy-ninth year of his age. He bore a high character for regular conduct, modesty, freedom from all petty jealousy, and generosity. He was well informed, agreeable in conversation, and died unmarried, leaving a large property to his relations. His works are at Rome, Parma, Piacenza, Modena, and Reggio, and in most of the museums and cabinets of Europe. A very good specimen of his best manner, 'Angels Weeping over the Dead Body of Christ,' is in the National Gallery.

GUERIN, PIERRE-NARCISSE, BARON, a distinguished French painter, born at Paris in 1774, was the pupil of J. B. Regnault. His works are the perfection of manner in imitation of the antique; they display notwithstanding great skill and perseverance. By antique manner in painting is meant what may be termed a literal translation into colour of the common characteristic ideal forms of Greek sculpture and bassi-relievi, without giving them life or motion; such pictures are evidently painted, and sometimes have the effect of a show of painted statues, in which each figure is independent of its neighbour. The works of Guerin may be justly censured for this defect, even more so than those of David; but it is perhaps made more obvious in the works of Guerin, as his subjects are mostly antique and in antique costume. The following are his principal works:—The first which attracted general attention was, 'Marcus Sextus, having escaped the proscriptions of Sulla, returns, and finds his daughter weeping by the side of her dead mother,' exhibited in 1798; in 1802 he exhibited an 'Offering to Æsculapius,' and 'Hippolytus, accused by Phædra, brought before Theseus;' in 1808, 'Bonaparte pardoning those who had revolted at Cairo;' in 1810, 'Pyrrhus and Andromache,' and 'Cephalus and Aurora;' in 1817, 'Dido listening to the story of Æneas,' 'Ægiasthus urging Clytemnestra to murder Agamemnon,' and 'St. Geneviève.' All these works have been engraved; the 'Cephalus and Aurora' by Forster: this subject is suited to Guerin's style, and it is one of the most beautiful of his works; it is in the Somariva collection. 'Æneas recounting the fate of Troy to Dido,' likewise engraved by Forster, is a gorgeous and elaborate work, especially in costume and accessories; but it wants chiar-oscuro, and has the defect already noticed in the highest degree. It is now in the Louvre, along with several other of his best works. The 'Révoltés du Caire' is at Versailles.

Guerin was appointed a professor in the École Royal des Beaux-Arts in 1814, and he was some years director of the French Academy at Rome: he was created baron after his return from Rome in 1829. He died at Rome, July 16th 1833. He was member of the Institute and many foreign academies, and chevalier of the Legion d'Honneur and of the order of St. Michel.

GUESCLIN, BERTRAND DU, was born in 1314, at the castle of Motte Broon, near Rennes. He was of a very strong make, but exceedingly plain; and accordingly he used to say, "I am very ugly, and shall never please the ladies; but I shall make myself dreaded by the enemies of my king." He could never learn to read or write, although he had a master; but he received in the house of his father that military education which was usually given to the nobles of his time. At the age of seventeen he distinguished himself at a tournament, and having immediately afterwards entered on his military career, he fought successfully in many battles and sieges against the English. By degrees he rose in rank; and after the capture of King John of France at the battle of Poitiers, he upheld by his efforts the cause of France against the formidable Black Prince, and obtained many advantages over the English. A short time after the accession of Charles V., in 1364, he gained a great victory at Cocherel over the army of the king of Navarre, for which he was rewarded with the office of marshal of Normandy, and created Count de Longueville. In the same year he was defeated by the English, and was obliged to surrender to Sir John Chandos. Peace being soon afterwards concluded, Du Guesclin was liberated on the payment of a ransom of 100,000 francs. At that time a great number of soldiers who were disbanded on the conclusion of peace, as well as many nobles of various nations, united under several leaders, and oppressed the country under the name of the 'grand compagnies.' Charles commissioned Du Guesclin to rid France of this annoyance, leaving him the choice of his own means. Du Guesclin persuaded many of these adventurers who had served under his command to accompany him to Spain, in order to fight against the Saracens. He gave them 200,000 golden florins, and promised that they would meet somebody on the road who would give them an equal sum. The companies following him with the greatest enthusiasm, marched upon Avignon, which at that time was the papal residence. The pope had excommunicated the companies: they

now asked for absolution and 200,000 francs. The absolution was granted, but the money was refused. The companies however, beginning to ravage the environs and to menace the town, obtained 100,000 francs, besides the absolution.

Du Guesclin did not lead his new troops against the Saracens, but against Peter the Cruel, king of Castile, and in support of his natural brother Henry of Trastamare. Peter was driven from his throne, and Henry established in his place. Du Guesclin was rewarded with wealth and honours by Henry, and returned to France; but Peter having obtained assistance at Bordeaux from the Black Prince, returned with a formidable army led by his ally. Du Guesclin, who hastened to the assistance of Henry, was defeated and taken prisoner. He remained for some time at Bordeaux, but a friend of his adroitly hinting to the Black Prince that some people believed that he kept Du Guesclin in prison only because he was afraid of restoring him to liberty, the chivalrous prince sent for Du Guesclin, telling him that he asked only 100 francs for his ransom, or even less, if he thought that sum too large. Du Guesclin offered 100,000 golden florins; and on the prince saying that it was too much, he declared that he would not give less than 70,000 golden florins, and that, although he was himself a poor knight, his friends the kings of Castile and France would pay that sum.

Du Guesclin again joined Henry of Trastamare against Peter the Cruel, who, in spite of the assistance given to him by the Moorish kings of Spain, was defeated and put to death, and his rival established on the throne of Castile. In 1369, when war had begun again between France and England, Du Guesclin was successful in nearly every engagement, and took from the English many places, which were reunited to France. He was afterwards employed in Bretagne with great success; but having at last met with some reverse, he was calumniated to the king, who loudly manifested his discontent. Du Guesclin felt the injury so deeply that he resigned his command, and resolved to go to Spain, in order to spend the remainder of his life with Henry of Trastamare, whom he had established on the throne of Castile. All the representations of his friends against this resolution were unavailing. His only wish, before leaving his country for ever, was to assist his friend Sancerre in the capture of the castle of Randam. He died during the siege of that place in 1380, in the 66th year of his age.

Du Guesclin is one of the most popular heroes of France, and his life has often been written. His first biography was published at Abbeville in 1487, entitled 'Le Triomphe des Neuf Preux, ou Histoire de Bertrand Du Guesclin.'

GUIBELINES. [GUELPHS AND GHIBELINES.]

GUICCIARDINI, FRANCESCO, born at Florence, in 1482, of a noble family, distinguished himself early in the study of the law, of which science he was made professor in his native city. In 1512 he was sent by his countrymen as ambassador to Ferdinand of Aragon, whose arms had become formidable in Italy. Guicciardini appears to have fulfilled his mission in such a manner as to establish a high opinion of his diplomatic abilities. In the following year he was sent on a mission to Leo X., who, being pleased with him, took him into his service, employed him in various important affairs, and finally appointed him governor of Modena, and afterwards of Parma, both which countries were then in the possession of the pope. After the death of Leo, and the short pontificate of Adrian VI., Clement VII., who succeeded to the papal chair, retained Guicciardini in his service, and trusted implicitly to him as his chief adviser, especially on the affairs of Florence. After the surrender of that city to the imperial and papal arms, in 1530, Guicciardini, as the agent of the pope and the Medici, had a considerable share in the changes that took place in the government of the republic; and he is reproached with having advised the proscription of the popular leaders. Afterwards he and the other adherents of the Medici resorted to the old expedient used in turns by the various factions, of calling together a parliament, or general assembly of the people, in the great square, which assembly voted the appointment of a balia, or dictatorial commission, which appointed a senate of forty-eight members, and this senate in its turn appointed all the subordinate magistrates, both administrative and judicial. It also established a commission of twelve, with the name of 'reformers of the state.' The members of this commission were chosen from among the adherents of the Medici, and Guicciardini was one, and the most influential of the number. The twelve began by abolishing the old authorities of the republic, the Gonfalonieri and the Priori, and proclaiming Alessandro de' Medici duke of Florence. The new duke had a foreign guard at the public palace, or town-hall, where he fixed his residence, and he began building a citadel to overawe the people. Filippo Strozzi, one of the twelve, who afterwards became the leader of the disaffected, furnished him with money to complete the work. Strozzi and others being soon disgusted at the haughtiness and licentiousness of the duke, left Florence and went to Naples to lay their complaints before the emperor Charles V., who had been a party to the capitulation of 1530, by which the liberties of Florence were guaranteed. The Duke Alessandro also repaired thither with Guicciardini, who had remained attached to him, and when the emperor communicated to him the accusations of the refugees, and asked for his reply, the duke entrusted Guicciardini with his defence. Guicciardini's answer was sophistically though cleverly written. He contended that the changes made in the government of Florence had

been effected by the parliament, or sovereign assembly of the people, according to the old practice of the republic, and at the instigation of those very refugees, Strozzi, Valori, Salviati, Ridolfi, and others, whose ambition not being satisfied, because the duke did not choose to give all his authority into their hands, made them now assume the language of popular discontent. But he slurred over the serious charges of cruelty, licentiousness, and other abuses of power, which were substantiated against the duke. The emperor, engrossed by his numerous state affairs, dismissed the Florentine question by stipulating with the duke that the refugees should have a full amnesty, and be allowed to return to Florence, and be restored to their property. He tried at the same time to make the duke acknowledge himself his feudatory: but Guicciardini prevented this, for although hostile to a popular form of government, he was anxious to maintain the political independence of his country under a native ruler. When the Duke Alessandro was murdered by his cousin and companion in debauch, Lorenzino de' Medici, in January 1537, Guicciardini by his timely measures prevented a popular explosion, and by his influence in the council obtained the appointment of Cosmo de' Medici as governor of the Florentine republic, with a fixed income of 12,000 golden florins a-year, and under the express condition that he should do nothing without the advice of his council. Here however Guicciardini miscalculated, and he was told so at the time by his brother-councillor Vettori: he wished to establish something like the government of Genoa or Venice; but the circumstances of those states were very different from those of Florence, where the Medici had been for a century past the hereditary leaders of a powerful party, and were supported by foreign powers. The event soon undeceived Guicciardini. Cosmo, aspiring, and clever, with more self-command than his predecessor Alessandro, soon exchanged his title of governor for that of duke, and established himself as absolute lord not only of Florence, but of all Tuscany. [COSMO I.] Guicciardini remained for some time attached to him; but finding his advice disregarded, he resigned his office, and withdrew to his country-house at Arcetri, where he employed himself in writing the contemporary history of Italy, which was not published till more than twenty years after his death. He died in his retirement, in May 1540, at the age of 58, and his death was said to have been hastened by disappointment at the untoward result of his political exertions.

Of Guicciardini's history, the first sixteen books were published in 1561, the other four appeared afterwards, and the whole twenty together were published for the first time at Venice in 1569: 'Istoria d'Italia di Francesco Guicciardini, gentiluomo Fiorentino, libri xx.' The work was afterwards frequently reprinted both in Italy and in other countries, and it has been translated into several European languages. The old Italian editions are mutilated from political motives; the first un mutilated edition was that under the fictitious date of Fribourg, 3 vols. 4to, 1775; but the most complete and correct edition is that by Professor Rosini, of Pisa, 10 vols. 8vo, 1819-20, with a luminous essay by the editor concerning Guicciardini's life and writings.

Guicciardini stands by common consent at the head of the general historians of Italy. His narrative, which embraces the period from 1494 to 1532, is that of a contemporary who had seen and participated in many of the events which he relates. He is very prolix, differing in this respect from the concise nervousness of his countryman Machiavelli, and his minuteness is sometimes wearisome. He has adopted Livy's custom of putting speeches into the mouths of his principal historical personages, and sometimes the sentiments he makes them express are not consistent with facts, as Foscarini has observed in his 'History of Venetian Literature.' In his narrative he has been charged, not with stating untruths, but with colouring and disguising truth when he speaks of parties which he dislikes, such as the Florentine popular leaders, the French, and the court of Rome, which, after the death of Clement VII., became hostile to the Medici. In his tone he cannot be called either moral or patriotic. Like Machiavelli, he belongs to the school of positive or matter-of-fact historians; he considers men such as he found them to be, and not such as they might or ought to be; he relates with the same coolness an atrocious act as a general one; and he seems to blame failure resulting from incapacity, or weakness, or scrupulousness, more than the success resulting from boldness and abilities, however unprincipled. Like some other statesmen, he considers an error in politics as worse than a crime. It must be observed however that Guicciardini lived in an age of triumphant dishonesty, that he was the contemporary of the Borgias, of Ferdinand of Aragon, of Ludovico Sforza, Bourbon, Pescara, and the worst of the Medici; and it is no wonder therefore that he ascribes the acts of public men to two great sources, selfish calculation, or passion, and seldom, if ever, to virtue, or disinterestedness. Collections have been made of the moral and political aphorisms scattered through his work, by his nephew Ludovico Guicciardini (Antwerp, 1585), by Anghiari (Venice, 1625), and others. Corbinelli published another collection of principles and sentences which it appears that Guicciardini had written separately for his own guidance: 'Consigli e Avvertimenti in materia di Re Publica e di Privata,' Paris, 1576. Part of his correspondence was published by Frà Remigio, in his 'Considerazioni civili sopra l'Istoria di Francesco Guicciardini,' Venice, 1582. Other letters of Guicciardini, written during his Spanish legation, have been published by Rosini: 'Legazione di Spagna,' Pisa, 1825.

Botta, a Piedmontese writer who died in 1837, has written an able continuation of Guicciardini's history in 50 books: 'Storia d'Italia continuata da quella del Guicciardini sino al 1789, di Carlo Botta,' 10 vols. 8vo.

GUIDO, D' AREZZO, who stands very prominently in all musical histories as the discoverer of the path which led to the invention of the modern system of notation, and of the true art of teaching singing, together with other improvements, was born at Arezzo in Tuscany, towards the end of the 10th century. When young he entered the Benedictine monastery of that city, probably as a chorister, and afterwards became a monk of the order. There he first conceived a new method of writing music, and of instructing in the art; and having well digested his plan, he there also carried it into effect, at a school opened by him for the purpose. On the old system, it is stated, ten years were consumed in acquiring a knowledge of plain song only; Guido's, we are told, reduced the years to as many months. His success excited, as commonly happens, the jealousy of his brethren, and he was driven to seek an asylum in another monastery. This we learn from his letter to Michael, a brother monk; and from the same it appears that the fame of his school having reached the ears of Pope John XIX., he was invited to Rome, and had the honour not only of explaining to the sovereign pontiff the nature of his new method, but of teaching the holy father to sing by it.

On his return from Rome he visited the abbot of Pomposa, in the duchy of Ferrara, who persuaded him to settle in that place. Here it was he wrote his 'Micrologus,' or brief discourse on music, in which most of his inventions are described, as well as his method of instruction. But his doctrine of solmisation, or the use of the syllables *ut, re, mi, &c.*, is not mentioned in that work; it is explained in a small tract under the title of 'Argumentum novi Cantus inveniendi.' The date of his death is unknown: it was probably about the middle of the 11th century.

To Guido we are indebted for the invention of the Staff, namely, the lines and spaces; for the reformation of the Scale, as also of the mode of notation, and for the art of Solmisation. Musical instruments being, it is to be presumed, very imperfect in his day, he taught his scholars to sing by a monochord, for the proper division of which he gives precise rules: but his reliance was on a system of hexachords, or scales of six notes, which he substituted for the ancient tetrachords, and on the syllables he applied to the different sounds. To this invention Guido is mainly indebted for the fame he has so long enjoyed. The art of counterpoint, and other important discoveries made before and after his time, have been attributed to him, but the assertions which have assigned to the ingenious ecclesiastic that to which he has no title, and never claimed, have been fully refuted.

GUIDO RENI (whom we place here as being, like Raffaele more generally known by his Christian name) was born at Bologna in 1574, where he studied painting, first under Denis Calvart, a Flemish artist of high reputation, and afterwards visited the school of the Caracci, who are reputed to have been jealous of him. He appears to have been some time undecided with respect to the style he should adopt. At first, as might be expected, he followed the Caracci, preferring however the manner of Ludovico. On visiting Rome he carefully examined every thing worthy the attention of an artist, and was enraptured with the works of Raffaele. He was also much struck with the great effect of the style of Caravaggio, which he attempted for a time, but happily laid it aside for the style peculiarly his own, in which the felicitous combination of grace, ease, grandeur, and elegance, with the highest perfection in the mechanical parts, lightness of pencil, freedom of touch, and exquisite delicacy, obtained him the universal applause of his contemporaries, and have secured him the lasting admiration of posterity. His genius was not indeed equally adapted to all subjects. He preferred and excelled in those in which tenderness, pathos, or devotion predominate; and in these he is distinguished from all other painters. He had a peculiar manner of painting the eyes large, the mouth small, the nostrils compressed, and the toes rather too closely joined. His heads are considered by many as equal to those of Raffaele in correctness of design and propriety of expression, an opinion in which we do not coincide: as regards intellectual character, sentiment, and purity, there can be no comparison made between them. His standard of female beauty was founded on the antique, the 'Venus de' Medici' and the 'Daughters of Niobe,' and hence perhaps has arisen a certain monotony. He finished his pictures with great care; his colouring is extremely clear and pure, but sometimes, especially in his later pictures, there is a greyish cast which changed into a lurid colour. It is to be lamented that an incurable propensity to gambling reduced him to distressed circumstances, so that his necessities compelling him to work for immediate subsistence without due regard to his honour and his fame, many of his later performances are much inferior to those which he painted in his happier days. He died August 18, 1642, aged sixty-eight. His works have always and justly been admired all over Europe, continually rising in estimation and value. Among his most celebrated works were—an altarpiece in the church of St. Philip Neri at Fano, representing Christ delivering the Keys to St. Peter; a 'St. John,' in the Archiepiscopal Gallery at Milan; the 'Virgin and Child and St. John,' in the Tanaro Palace at Bologna; and the 'Penitence of St. Peter after denying Christ,' with one of the apostles comforting him, in the Zam-

pièri Palace, one of his most excellent works. There are several of his pictures in the National Gallery, including some of large size and considerable celebrity.

GUIGNES, JOSEPH DE, was born in 1721 at Pontoise, and studied the Oriental languages under Stephen Fourmont. In 1745 he was nominated Oriental interpreter to the royal library in the place of Fourmont, and in 1752 was chosen a member of the Académie des Belles Lettres. The French revolution reduced him to great destitution, but he supported his misfortune with equanimity, and refused to accept any assistance. He died at Paris in 1800.

His 'Histoire Générale des Huns, des Turcs, des Mogols, et des autres Tartares Occidentaux,' Paris, 1756-58, 5 vols. in 4to, is written with great industry, and founded upon Oriental authorities, many of which had not been made use of before; but the work is defective in point of criticism and style. He has however the undoubted merit of being the first writer who attempted to compare the accounts of Western authors with those of China. He was the first who also attempted to discover the origin of the Huns, Turks, Avars, and other barbarous nations, and to trace out the road by which they reached the west of Asia and Europe. The other principal works of De Guignes are—twenty-eight memoirs inserted in the collection of the Memoirs of the Académie des Inscriptions. The most important of them are—'Mémoires sur quelques Evénemens qui concernent l'Histoire des Rois Grecs de la Bactriane;' 'Sur quelques Peuples qui ont envahi l'Empire Romain;' 'Sur les Liaisons et le Commerce des Romains avec les Tartares et les Chinois.' Many of his memoirs are designed to prove the Egyptian origin of the Chinese. Of these the principal is entitled, 'Mémoire dans lequel, après avoir examiné l'Origine des Lettres Phéniciennes et Hébraïques, on essaie d'établir que le caractère épistolaire, hiéroglyphique, et symbolique des Egyptiens se retrouvent dans les caractères Chinois, et que la nation Chinoise est une colonie Egyptienne.' The 'Mémoire sur le Commerce des François dans le Levant avant les Croisades,' is one of considerable value. De Guignes wrote many able papers for the 'Journal des Savans,' of which he was one of the most active editors for thirty-five years. He left in manuscript—1, 'Diverses Notices des Auteurs Arabes;' 2, 'Mémoire sur le Commerce des Chinois avec les Russes;' 3, 'Histoire de la Chine,' compiled from Chinese authors; 4, 'Mémoires Historiques et Géographiques sur l'Afrique d'après les Auteurs Arabes.' He also edited, 1, the translation of 'Choo-King,' 1770, by Gaubil, which he revised and corrected according to the Chinese text, and enriched with very valuable notes; 2, 'Eloge de la Ville Moukden, Poème Chinois, composé par l'Empereur Kienlong,' 1770, and 'L'Art Militaire des Chinois,' 1771, both translated by le Père Amiot.

GUISCHARD, CHARLES, a colonel in the service of Frederick the Great, distinguished himself in the Seven Years' War, after the end of which he availed himself of the leisure of peace to write several works on the military art of the ancients:—1, 'Mémoires Militaires sur les Grecs et les Romains,' in which he criticises the opinions of Folard, and exposes his mistakes. [FOLARD, J. C. DE.] 2, 'Mémoires Historiques et Critiques sur plusieurs Points d'Antiquités Militaires,' which contains a reply to the Chevalier Looz, who had written a book in defence of Folard.

GUISE, or GUYSE, DUKES OF, the title of a branch of the sovereign house of Lorraine, which settled in France at the beginning of the sixteenth century. Claude of Lorraine, fifth son of René II., duke of Lorraine, and of Philippa of Guelderland, after contesting his father's succession with his elder brother, went to France, where he married Antoinette de Bourbon in 1513. He served with distinction in the French armies, and was severely wounded at the battle of Marignan in 1515. In 1527, Francis I. made him duke of Guise in Picardy, and peer of France. He died in 1550, leaving a numerous family. One of his daughters married James V., king of Scotland, by whom she had Mary Stuart. Claude's eldest son, Francis, born in 1519, succeeded to the title of duke of Guise. He had been previously made by Henri II. duke of Aumale, or Albemarle, in Normandy, in 1547, and he married Anna of Este, daughter of the duke of Ferrara, and grand-daughter, by her mother Renée, of Louis XII. Francis of Guise was the most illustrious of his family, both for his military talents and for his humanity and generosity, qualities not very common among the warriors of that age. Owing to a severe wound which he received in his face at the siege of Boulogne in 1545, and which left a scar for the rest of his life, he was called Balafre, or 'Scarred.' He fought in the wars against Charles V., and afterwards against Philip II., and took Calais from the English, who had possessed it for more than two centuries. He and his brother Charles, cardinal of Lorraine, had the principal share in the government of France under the reigns of Henri II. and Francis II. The conspiracy of Amboise (as it was called) by the Calvinists and the prince of Condé, was intended to overthrow the power of the Guises; but the duke having had timely information of it, removed the king, Francis II., to Amboise, and had himself appointed lieutenant-general of the kingdom, upon which most of the conspirators were arrested and executed. Under Charles IX. the influence of the Guises somewhat declined, the court being divided between two parties, that of Guise and that of Condé and Coligny. The war of religion having broken out in 1562 by the affray at Vassy, where the Duke of Guise's servants

and attendants killed a number of Calvinists, the duke fought under the Constable of Montmorency at the battle of Dreux. Shortly after he was murdered in his camp before Orléans by Poltrot de Méré, a Calvinist, who looked upon him as the most formidable enemy of his co-religionists.

The character of Francis duke of Guise has been the object of much angry distortion, in consequence of his having lived in times of religious and civil strife. Francis's eldest son, Henry, also called the Balafre, from a scar which he received in battle, succeeded to his father's titles, and became the leader of his powerful party. Less magnanimous and more factious than his father, he mixed deeply in all the intrigues and plots of the League, a political and religious association first projected by his uncle, the cardinal of Lorraine, ostensibly for the purpose of defending the Roman Catholic religion and the king, but in reality to rule over both king and kingdom for party purposes. Henri of Guise was one of the advisers of the St. Bartholomew, and he ordered the murder of Coligny. He excited the fury of the bigoted populace against the Calvinists, whom he not only defeated in battle, but hunted down in every part of the kingdom, with all the ruthlessness of personal hatred. After the death of the imbecile Charles IX., he ruled at will over the weak and profligate Henri III., and obliged him to break the promises of peace and toleration which he had made to the Calvinists. Henri III. however, and even his mother Catherine of Medici, became jealous of the ambition and weary of the insolence of the Guises, and the duke was forbidden to appear at the court and at Paris. Upon this he then openly raised the standard of revolt against his sovereign, and defeated him in his own capital on the 12th of May 1588. This was called the 'Day of the Barricades.' The king left Paris, and withdrew to Chartres, from whence he convoked the states-general of the kingdom to assemble at Blois. There seems no doubt that the faction of the Guises intended to dethrone Henri, and that for that purpose it kept up a treacherous correspondence with the Spaniards, who were then the enemies of France, and the pope. The states were opened at Blois on the 16th of October 1588, and the deputies were found to be almost wholly in the interest of the Duke of Guise and his brother the cardinal, who were present. The session was stormy, and the royal authority in danger. The duke demanded to be appointed high-constable and general-in-chief of the kingdom. Henri III., pusillanimous and unprincipled, and advised by courtiers as wicked as himself, resorted to assassination in order to get rid of the Guises. Crillon, the commander of the French guards, was sounded for the purpose. "I will fight him openly," answered that brave officer, "and shall endeavour to kill him." This did not suit Henri, who found a more docile instrument in Lognac, first gentleman of the chamber, who picked out nine Gascons of the new body-guard, and concealed them in the king's closet. As the Duke of Guise was entering the royal apartment on the 23rd of December 1588, he was pierced with daggers, and expired, exclaiming "O God, have mercy upon me!" He died at thirty-eight years of age. He was brave, fearless, and generous to his friends, but unprincipled, unscrupulous, ambitious, and cruel to his enemies. The cardinal his brother was arrested and killed in prison the next day. Their brother, the Duke of Mayenne, being absent, saved his life. Charles, eldest son of Henry Guise, who was yet a boy, was arrested at Blois, and confined in the castle of Tours, from which he escaped in 1591. He and his uncle of Mayenne, and his cousin Charles duke of Aumale, became the leaders of the League against Henri IV. [AUMALE.] After that king's abjuration Charles duke of Guise submitted to him in 1594, and the Duke of Mayenne followed his example next year. Charles was made Governor of Provence, but under the following reign of Louis XIII. Cardinal Richelieu, jealous of his name and influence, obliged him to leave France. He retired to Tuscany, where he died in 1640. His son Henry II., born in 1614, was at first brought up for the Church; but after the death of his elder brother he quitted the clerical state, and assumed the title of Duke of Guise. Having conspired against Cardinal Richelieu, he was tried by the parliament, and condemned, *par contumace*, in 1641. In 1647 he placed himself at the head of the revolted Neapolitans [ANIELLO TOMASSO], but was taken prisoner by the Spaniards; and being released in 1652, he returned to Paris, where he died in 1664, leaving no issue. His 'Mémoires' were published after his death. His younger brother, Louis duke of Joyeuse, left a son, Louis Joseph of Lorraine, duke of Guise, who died in 1671, leaving an infant son, who died in 1675, five years of age. The line of the Guises thus became extinct; but the collateral branch of the dukes of Elbeuf has continued to the present time.

* GUIZOT, FRANÇOIS-PIERRE-GUILLAUME, was born October 4, 1787, at Nîmes, in the French department of Gard, where his father, François-André Guizot, an advocate of distinction, and a Protestant, became one of the victims of the French Revolution, and was executed on the 8th of April, 1794. The widow, left with two sons, of whom François was the elder, removed from her native town to Geneva, where she had some relatives, and where she hoped to obtain a better education for her children. After having completed his studies in the gymnasium of Geneva with extraordinary success, and acquired the Greek, Latin, German, English, and Italian languages, M. Guizot in 1805 proceeded to Paris for the purpose of studying jurisprudence, the schools of law having been re-established in 1804

Instead, however, of prosecuting this study, he accepted an engagement as tutor in the family of M. Stapfer, who had been for many years ambassador from Switzerland to Paris, and by him was introduced to M. Suard, in whose reception-rooms he had the opportunity of becoming acquainted with some of the most distinguished literary persons of the time. In 1809 he published his first work, a 'Dictionnaire des Synonymes,' which was followed by 'Vies des Poètes Français,' and by an edition of Gibbon's 'Decline and Fall of the Roman Empire,' with historical notes by the editor. M. Guizot had been for some time a periodical writer, and his 'Annales d'Education,' 6 vols. 8vo, extend from 1811 to 1813. His talents were already known, when in 1812 M. de Fontanes attached him to the University of Paris as assistant in the Professorship of History in the Faculty of Letters, and not long afterwards named him Professor of Modern History, a chair which he was peculiarly fitted to occupy with distinction. In the winter of 1812 he married Mademoiselle Pauline de Meulan, a lady of birth, whose family had been ruined by the Revolution, and who supported herself and others of her family by journalism. She was considerably older than himself, but maintained her influence over him as long as she lived. In the winter, while M. Guizot was occupied with his duties as Professor of Modern History he formed an intimate acquaintance with M. Royer-Collard, who was then Professor of the History of Philosophy.

In the year 1814 M. Guizot paid a visit to his mother, who was then residing in her native town of Nîmes. Before his return, Louis XVIII had been seated on the throne of his ancestors; and the young professor was indebted to the active friendship of M. Royer-Collard for the patronage of M. Montesquieu, then minister of the interior, who appointed him his secrétaire-général. This was the first step of M. Guizot in the career of politics. The return of Napoleon I. from the island of Elba displaced him from his political situation, and he resumed his occupation as Professor of History. After the restoration of Louis XVIII. M. Guizot was appointed secrétaire-général to the Minister of Justice, and his execution of the duties of this office was strongly censured by the ultra-royalists. His first political pamphlet, 'Du Gouvernement Représentatif et de l'État Actuel de la France' placed him in the ranks of the constitutional royalists. In his 'Essai sur l'Instruction Publique,' published in 1816, he defended the cause of public education against the attacks of the Jesuits. In 1818 he was named Conseiller d'État, and while M. Decazes was Minister of the Interior, M. Guizot had an office specially formed for him in the communal administration of the departments.

After the assassination of the Duc de Berri, February 14, 1820, the ultra-royalist party gained the ascendancy, and the constitutional royalists, M. Decaze, M. Royer-Collard, M. Guizot, and the rest, were expelled from office. In the years 1820-22 M. Guizot published several political pamphlets directed generally against the administration of M. Villèle. His treatise 'Des Moyens d'Opposition et de Gouvernement dans l'État Actuel de la France,' published in 1821, may be regarded as an exposition of his own political principles. His historical lectures at the Sorbonne were attended by crowded audiences, but the free expression of his opinions gave offence to the government, and his lectures were suspended. M. Guizot then relinquished politics for a time, and resumed his historical researches. In the period from 1822 to 1827, he published a 'Collection des Mémoires relatifs à l'Histoire de la Révolution d'Angleterre,' a 'Collection des Mémoires relatifs à l'Ancienne Histoire de France,' 'Essais sur l'Histoire de France,' the first part of his 'Histoire de la Révolution d'Angleterre,' comprising the whole of the reign of Charles I., and his 'Essais Historiques sur Shakespeare.' He also established the 'Revue Française,' and was one of the founders of the society called "Aide-toi, le Ciel t'aidera" (Assist thyself, and Heaven will assist thee), the object of which was to secure the freedom of elections.

In 1828 the ministry of M. de Martignac allowed him to resume his lectures at the Sorbonne; they were attended by very large numbers, and occupied much of his time from 1828 to 1830. At the end of 1828 he married his second wife, niece of his first wife, who when she was dying advised the union. In 1829 he was re-appointed Conseiller d'État, and in the same year became part-editor of the 'Journal des Débats' and of 'Le Temps.' In January 1830 he was elected for the first time a member of the Chamber of Deputies by the arrondissement of Lisieux, department of Calvados, where he had an estate.

M. Guizot had assisted largely in producing the Revolution of 1830, which expelled Charles X. and introduced Louis-Philippe, and the commission which sat in the Hôtel de Ville on the 31st of July named him Minister of Public Instruction, and the next day appointed him Minister of the Interior. The ordinances of the 2nd of November in the same year put an end to his ministry; he opposed that of Lafitte, who succeeded him, and supported strongly that of Casimir Périer. In the cabinet of the 11th of October 1832, of which Marshal Soult was the head, he became again the Minister of Public Instruction. In his department of the government many important reforms were carried out. The law of the 28th of June 1833, on primary education, prepared by himself, raised in a brief period, in 9000 communes, the village school-room for the instruction of the village poor. This ministry was dissolved February 22, 1836, but under the ministry

of M. Molé, which followed, he was recalled to his former office. He afterwards accepted an embassy to London, under the ministry of M. Thiers, but the treaty which he concluded July 15, 1840, was received with much dissatisfaction in France.

The ministry of M. Thiers was dissolved, and though in the cabinet of October 29, 1840, the Duke of Dalmatia (Soulé) was president of the council, M. Guizot, who became Minister of Foreign Affairs, was in fact the head of the government. The long ministry of M. Guizot was terminated February 24, 1848, by the abdication and flight of the king, Louis-Philippe. M. Guizot himself made his escape in the dress of a workman; he was allowed to return to France in 1849, when he also returned to politics by his pamphlet, 'De la Démocratie en France.' He also published in the 'Revue Contemporaine,' the articles 'Pourquoi la Révolution d'Angleterre a-t-elle réussi?,' 'Monk, ou la Fin de la Révolution d'Angleterre;,' and 'Portraits Politiques' of several men of eminence. After the death of Louis-Philippe in 1850 he is understood to have joined the Bourbon party called the Fusion, and to have become one of the supporters of the journal called 'L'Assemblée Nationale,' which represents that party. After the coup d'état he published in the 'Revue Contemporaine' an article 'Cromwell serait-il Roi?' Cromwell in a short time became Emperor, and those who desire to see a constitutional government established in France must wait.

M. Guizot's 'Histoire de la Civilisation,' 5 vols. 8vo, contains the substance of his lectures delivered at the Sorbonne. His 'Histoire de la Révolution d'Angleterre' was extended in 1852 by the 'History of Oliver Cromwell,' and completed this year (1856) by the 'History of Richard Cromwell, and the Restoration of Charles II.' All these historical works have been translated into English, as well as his 'Étude Historique sur Washington,' 'Shakespeare, et son Temps,' 'Corneille, et son Temps,' 'Méditations et Études Morales,' 'Études des Beaux Arts en Général,' and a small work on the 'Married Life of Rachel Lady Russel.'

GULDINUS, or GULDIN, HABAKKUK, afterwards Paul, was born at St. Gall in 1577, and was bred a Protestant, but became a Roman Catholic in or before 1597, in which year he took the vows of a Jesuit, as 'coadjutor temporalis.' Having shown a talent for mathematics, he was allowed to study at Rome, and afterwards taught, first at Gratz, then at Vienna. He wrote for the Gregorian Calendar against Calvisius, and against Scaliger, on the precession of the equinoxes; also on the geographical problem of the method of numbering the days of those who sail to the new world, on Centrobarycs, and other things. He died in 1643. This is the account given by Riccioli of a writer whose memory would not have required notice in this work if it had not been for some propositions mentioned by Pappus, which he appropriated without acknowledgement, and which for a long time passed under his name. These propositions, though they now merge in an elementary formula of the integral calculus, and are not used in the form in which Pappus and Guldinus exhibited them, nevertheless give a very good conception of the properties of the centre of figure, and, under the title of the 'Centrobaryc Method,' form an interesting step in the chain of reasonings which preceded the differential calculus.

The work of Guldinus, 'De Centro Gravitatis' (of which the first book was published at Vienna in 1635, and the rest, owing to the disturbed state of the country, in 1640 and 1641), is a laboured geometrical treatise on the properties of the centre of gravity, including applications and verifications of the theorems of Pappus, but no demonstration. The attempt to prove these theorems was a failure in the hands of Guldinus. To put it beyond question that this writer really did borrow from his predecessor, we subjoin a paragraph from the preface of the seventh book of the collection of Pappus, taking the Latin text of Commandine, which was published before Guldinus, and which he cites. It must be remembered that the text of this preface is very imperfect:—"Perfectorum utrorumque ordinum proportio composita est ex proportione amphismatum, et rectorum linearum similiter ad axes ductarum à punctis, quæ in ipsis gravitatis centra sunt. Imperfectorum autem proportio composita est ex proportione amphismatum, et circumferentiarum à punctis quæ in ipsis sunt centra gravitatis, factarum."

But the work of Guldinus called the attention of a more powerful geometer to the subject. He had made some objections to the theory of indivisibles of Cavalieri, to which the latter replied in the third of his 'Exercitationes,' and ended his reply by making the method of indivisibles furnish the demonstration which Guldinus was not able to find. It is therefore to Cavalieri, and not to Guldinus, that the credit is due of having made the first advance upon Pappus.

GUNST, PIETER VAN, an excellent Dutch portrait-engraver, who however possessed more patience than ability, was born at Amsterdam about 1667. He engraved a set of ten full-length portraits, after Vandyck, from drawings made in England in 1713 by Arnold Houbraken, who received one hundred florins each for them. He also engraved a set of portraits, after Vander Werff, for Larrey's 'History of England;' and he engraved the portrait of Franciscus Junius, after Vander Werff, which is inserted as a frontispiece to the 'Pictura Veterum,' Rotterdam, 1694. His works are extremely neat in execution, especially the heads: he appears to have studied the works of the Drevets. Among his historical, or figure pieces, which are inferior

to his portraits, are nine 'Loves of the Gods,' after Titian. The date of his death is not known.

GUNTER, EDMUND, was born in the county of Hertford, but descended originally from Gunter's Town, in Brecknockshire. He was educated on the royal foundation at Westminster School, and elected thence to Christchurch College, Oxford, in the year 1599, being then eighteen years of age, where he took the degrees in Arts. Mathematics were the prevailing studies of his youth, and about the year 1606 he invented the sector, and wrote the description and use of it in Latin, many copies of which were taken in writing, but none of them printed. After this he took orders, became a preacher, in 1614 was admitted to read the Sentences, and proceeded to the degree of Bachelor in Divinity. But his genius still leading him chiefly to mathematical pursuits, when Mr. Williams resigned the professorship of astronomy in Gresham College, he was chosen to succeed him on the 6th of March 1619. He died on the 10th of December 1626, about the forty-fifth year of his age. (Ward, 'Lives of the Gresham Professors'.)

The works of Gunter are as follows:—

1. 'Canon Triangulorum,' 8vo, London, 1620, and 4to, 1623. A table of logarithmic sines, &c., to seven decimal places, the first of the kind which were published on Briggs's system of logarithms.

2. 'Of the Sector, Cross-staff, and other Instruments' (first published in 1624). The invention of the sector, which now forms a part of every case of drawing instruments, is due to Gunter, and its uses are described by him in three books. The cross-staff is not the surveying instrument now known by that name, but an instrument for taking angles, consisting of one straight line moving at right angles to another, with sights at their extremities.

3. 'The Description and Use of his Majesty's Dials in Whitehall Garden,' 4to, London, 1624. These dials (destroyed in 1697) were constructed by Gunter.

The first two of these works went through five editions, the fourth of which, purporting to be examined and enlarged by W. L. (William Leybourn), contains improvements in the sector by Samuel Foster, &c. The fifth, which is a reprint of the fourth, was published in 1673, and (with a new title-page only) in 1680.

Gunter's writings (the 'Canon Triangulorum' excepted) consist almost entirely of a description of graphical methods of constructing problems in trigonometry, navigation, &c. He was the first who laid down a logarithmic scale upon wood, and used it for the purposes of the draughtsman. This scale is still used, and goes by his name. The common chain used by surveyors also goes by his name. The first observation of the variation of the compass is due to Gunter. Ward infers this from a letter of Dr. Wallis to Sir Hans Sloane, attributing the observation to a Gresham professor about 1625, which could be no other than Gunter. Other writers mention the same discovery, but without stating their authority. The following is the account of Gunter himself ('On the Cross-staff,' book ii. ch. 5), in which the enunciation of the variation is an appendage to an example of the method of taking angles by the cross-staff, as follows:—"So that if the magnetical azimuth A Z M shall be 84° 7', and the sun's azimuth A Z N 72° 52', then must N Z M, the difference between the two meridians, give the variation to be 11° 15', as Mr. Borough heretofore found it by his observations at Limehouse in the year 1580. But if the magnetical azimuth A Z M shall be 79° 7', and the sun's azimuth A Z N 72° 52', then shall the variation N Z M be only 6° 15', as I have sometimes found it of late. Hereupon I inquired after the place where Mr. Borough observed, and went to Limehouse with some of my friends, and took with us a quadrant of three-foot semidiameter, and two needles, the one above six inches and the other ten inches long, where I made the semidiameter of my horizontal plane A Z 12 inches; and towards night, the 13th of June 1622, I made observation in various parts of the ground, and found as followeth." Eight observations are then given, the results of which are from 5° 40' to 6° 13', with a mean of 5° 58'.

Gunter is said to have been the first who introduced the words cosine, cotangent, &c., in place of sine of the complement, &c. In the preface of the 'Canon,' he speaks of the "sine of the complement, which in one word may be called the cosine," as if he were introducing a new word. There is also the testimony of Briggs ('Arith. Log.,' cap. 13) that Gunter suggested to him the use of the arithmetical complement. Whatever in short could be done by a well-informed and ready-witted person to make the new theory of logarithms more immediately available in practice to those who were not skilful mathematicians was done by Gunter.

GURNEY, JOSEPH JOHN, was born August 2, 1788, at Earham Hall, near Norwich, the country residence of his father, John Gurney, who was a member of the Society of Friends, and one of the partners of the Norwich bank. He was the tenth child of eleven children left by Mrs. Gurney at her death, Elizabeth Gurney being the third. [FRY, MRS. ELIZABETH.] Joseph Gurney completed his education at Oxford under a private tutor, without becoming a member of the university, of which however he enjoyed many of the advantages. He acquired the Hebrew and Syriac languages, as well as Greek and Latin, mathematics, and a large amount of general knowledge. After the death of his brother John in 1814, he assumed his brother's Christian name in addition to his own. Joseph John Gurney in 1818

became a recognised Minister of the Society of Friends, and his preaching is described as having been very impressive. He accompanied Mrs. Fry in her journey to Scotland in 1818, and to Ireland in 1827, to inquire into the state of the prisons, and of the results of this last journey he wrote a Report addressed to the Marquis Wellesley, lord-lieutenant of Ireland, which was afterwards published. In 1837 he visited the United States of America and the Canadas, and was absent about three years. The journal of his travels was printed, but only for private circulation. In 1841 he made a journey to Holland, Belgium, and Germany, accompanied by Mrs. Fry, and in 1842-43-44, another journey to France and Switzerland, in the earlier part of which he was again accompanied by Mrs. Fry. The object of these journeys was to introduce improvements in prison-discipline, and also to induce the French government to abolish slavery in the French colonies, for which purposes he had an interview with Louis-Philippe, and much communication with M. Guizot.

Joseph John Gurney was the author of several works, religious and moral. His 'Observations on the Distinguishing Views and Practices of the Society of Friends' has been several times reprinted, as have also his 'Essays on the Evidences, Doctrines, and Practical Operation of Christianity,' a work intended for Christians generally. All his works are ably and judiciously written. He took an active part in many benevolent societies, such as those for the abolition of slavery, for the repeal of the laws inflicting capital punishments, in peace-societies, temperance-societies, the British and Foreign Bible Society, and others. His donations to charitable institutions and for the relief of public distress were numerous and princely. His private gifts were only bounded by his judgment as to what was appropriate in each particular case. He died on the 4th of January 1847, at Earham Hall.

(Memoirs of Joseph John Gurney, with Selections from his Journal and Correspondence, edited by Joseph Bevan Braithwaite, 2 vols. 8vo.)

GURWOOD, JOHN, an officer whose name will always be honourably associated with that of the Duke of Wellington, must have been born in 1791, as it is incidentally mentioned that he ceased to be a ward of chancery and came of age in 1812. He entered the army as an ensign in the 52nd regiment in 1808, and served during the war in the Peninsula, where he was distinguished for his accurate knowledge of the French and Spanish languages. He first emerged into notice as Lieutenant Gurwood, by volunteering to lead the forlorn hope at the storming of Ciudad Rodrigo, on the 19th of January 1812. Circumstances afterwards led him to print a minute account of all the transactions in which he was personally concerned on that night in a pamphlet, which is one of the most curious and instructive contributions in existence to the history of the Peninsular War, containing a number of details which are eminently characteristic and suggestive. When he knew that his offer had been accepted, "I kept on eating," he tells us, "principally bread, but I carefully controlled my thirst, knowing how insatiable it becomes under nervous excitement. On the concerted signal for the assault—three guns from the batteries—my heart beat double quick, and I applied my mouth to the calash of Jack Jones, from which I swallowed a gulp of 'aguardiente.' On arriving at the top of the breach, I saw a musket levelled not far from my head, and a Frenchman in the act of pulling the trigger. I bobbed my head in time, but was wounded and stunned by the fire. I found myself at the bottom of the breach; I cannot tell how long I was there, but on putting my hand to the back of my head, where I felt that I had been wounded, I found that the skull was not fractured." Recovering from his trance, "we again set up a shout, scrambled up the breach, and gained the rampart of the bastion." Here his attention was attracted by seeing one of his men, Pat Lowe, in the act of bayoneting a French officer who resisted being plundered, and he saved the Frenchman by knocking down the Irishman. His prisoner guided him to a tower, where he found the French governor of the place, and some other officers, who had shut themselves up from the now victorious English soldiers. He summoned them to surrender, and the door was unbarred; but Pat Lowe, who had rejoined him, called out, "Dear Mr. Gurwood, they will murder you!" and as he entered he was seized round the neck, and fully expected a sword in his body; but his alarm ceased on finding himself kissed by the person who had seized him, who added that he was the governor, General Barrié, and that he yielded himself his prisoner. Gurwood carried him to Lord Wellington, whom he found in the ramparts, who said to him, "Did you take him?" and, on his replying in the affirmative, handed to him the governor's sword, which had just been surrendered, with the observation, "Take it, you are the proper person to wear it." He wore it ever after, and by special privilege when every other officer in the English army wore a regulation sword. From this time he became a noted officer; but though he served with distinction during the rest of the Peninsular war, and at Waterloo, where he received a severe wound, the rank of colonel was the highest that he attained, and he did not become full colonel till 1841. In 1830 he was placed on the unattached list, and shortly afterwards became private secretary to the Duke of Wellington. This appointment led to a very remarkable publication. In 1834 he commenced the issue of 'The Despatches of Field-Marshal the Duke of Wellington, K.G., during his various campaigns in India, Denmark, Portugal, Spain, the Low Countries, and France, from 1799 to 1818, compiled from official and authentic documents, by Lieutenant-Colonel

Gurwood.' The work extended, with a volume of index, to thirteen volumes; the publication of it occupied the colonel for a series of years, and its popularity was unexpected and unexampled. No collection of official documents of any length has ever found its way into so many libraries and so many hands. A second edition was called for, and an abridgment in one volume was issued to satisfy the curiosity of those who could not purchase the complete edition. The reputation of the Duke of Wellington appears to have been materially raised by the publication, and most of his popularity in later life was based on the 'Despatches.'

Colonel Gurwood urged him to give his consent to other publications bearing on his military career, but did not always succeed. The colonel was in the habit of showing his friends a paper by the duke on the battle of Waterloo, in answer to the observations on the subject by the Prussian general Clausewitz, and was much surprised at finding that one of those to whom he showed it was guilty of a breach of confidence. The whole appeared in print in 'Fraser's Magazine' as a portion of a review of Captain Siborne's 'History of the Battle.' The reader who is curious to see what Wellington had to say on Waterloo may be assured that he will find it word for word in that magazine for July 1844, without the slightest intimation from whose pen it proceeds—a fact which would indeed never be conjectured by any one perusing the article without previous information as to its authorship. The duke also supplied to the present Earl of Ellesmere some observations on the battle which are interwoven with his article on Alison's 'History of the War' in the 'Quarterly Review.' In return for the colonel's services the duke appointed him deputy-governor of the Tower of London. He again visited Spain in company with Lord Eliot, the present Earl of St. Germans, to endeavour to mitigate the cruelties of the civil war between the Carlists and Christianos, in which neither party gave quarter, and their mission was partially successful.

From the time of the publication of some portions of Napier's 'History of the Peninsular War' in 1840, Colonel Gurwood was involved in a disagreeable controversy respecting the circumstances of the capture of the governor of Ciudad Rodrigo. An officer of the rank of major, who had commanded one of the storming parties, made a statement in October 1838 to the effect that he (the major) had accepted the surrender of the governor; that a sword, afterwards found to be that of an aide-de-camp, had been presented to him in token of surrender; and that while he was engaged with two officers who laid hold of him for protection, one on each arm, Lieutenant Gurwood came up and obtained the sword of the governor; on seeing him present which on the ramparts, the major, according to his own account, "turned on his heel and left the spot." The major died in 1839, and this statement was made public in the following year in a second edition of that portion of Napier's history relating to the events of Ciudad Rodrigo, the first having stated that "Mr. Gurwood, who though wounded had been amongst the foremost at the lesser breach, received the governor's sword." Colonel Gurwood had been in garrison with the major in 1834 at Portsmouth, and always wore the sword when in uniform; but this circumstance had not produced any remark from that officer. A long and vexatious discussion ensued on the point, which was brought to a close by a very singular incident. Gurwood did not know the name of the French officer whom he had rescued from Pat Lowe, and whose evidence would of course be most important to show the justice of his claims, as the Frenchman had guided the Englishman to the tower where the governor was found, and witnessed what then took place. In turning over the duke's papers in 1844, the colonel found a letter addressed to Lord Wellington in 1812 by a captive French officer named Bonfilh, who might, he inferred, be the person he was in search of. He made inquiries in Paris to ascertain if M. Bonfilh was still alive, found that he was, wrote off to him, and received a letter dated the 1st of May 1844, in which M. Bonfilh informed him that he was indeed the officer whose life he had saved, and gave a statement of all that he remembered of the night of the storm, which differed in some few unessential particulars from the recollections of the colonel, but in all essential ones confirmed his statement, and was irreconcilable with that of the major. The colonel read it with feelings which he declared it impossible to describe. He visited M. Bonfilh at his residence in France, and embodied the history of the whole affair in a pamphlet, of which he printed only fifty copies for private circulation, from one of which these particulars are taken. The preface is dated on the 14th of June 1846, and it was his last literary effort. On the 25th of December in the same year, in a fit of temporary insanity, which was attributed to the inquiet to the effects of the wound he had received so many years before at Ciudad Rodrigo, he terminated his life by his own hand at Brighton, leaving a widow, a French lady, and three daughters.

GUSTAVUS ERICKSON, or GUSTAVUS I., King of Sweden, commonly called GUSTAVUS VASA, a descendant of the ancient kings of Sweden, was born May 2nd 1490 at Ockestadt, near Stockholm, Sweden, which by virtue of the treaty of Calmar made in the year 1397 had become a dependency of the crown of Denmark, had by a successful insurrection thrown off the Danish yoke, and was at that time governed by a Swedish stadtholder. Denmark however never relaxed her efforts to regain her dominion, and she at length succeeded, with the assistance of the Archbishop of Upsal, in the year 1519. Protestantism began about this time to extend itself widely in Sweden, and on this

account the pope and the archbishop of Upsal, the primate of the kingdom, afforded to Christian of Denmark all possible help. Christian seized upon the Swedish capital, and caused Erickson, of whom he was most apprehensive, to be confined in Calloe, a Danish fortress. By the assistance of the ecclesiastical party, Christian procured himself to be acknowledged king of Sweden by the assembled people, and was crowned in their presence. Before his coronation he promised to release all prisoners, and to maintain the rights and freedom of the Swedish nation; but within three days after his coronation, and on the 8th of November 1520, he violated his solemn promise by ordering the chiefs of the most respectable Swedish families, and also the members of the senate, to be arrested, and afterwards beheaded in the market-place. Thus perished in one day eighty-four persons, all belonging to the first families, and among them the father of Gustavus Vasa. When the people who were assembled at the place of execution could no longer restrain their feelings, and showed a disposition to deliver their friends and countrymen from the hands of the executioner, the Danish troops rushed upon the unarmed multitude, and massacred all who fell into their hands, without distinction of age or sex. These executions were continued for several days, and Christian thus hoped to destroy every adherent of the Swedish party. The streets of Stockholm ran with human blood; for three days several hundred dead bodies lay upon the ground, and were at length burnt before the gates of the city.

In the meantime young Erickson had escaped from his prison; and after a short stay at Lübeck, where, in vain, he solicited the assistance of that powerful town, had fled into the mountains of Dalecarlia. Here he received intelligence of the bloody scenes enacted at Stockholm, and of the fate of his father. When Christian was apprised of the escape of Gustavus, he set a price upon his head, and threatened with death every one who gave him the least assistance. The dread occasioned by these threats closed every door against him; and even an old servant, upon whose fidelity he had counted, not only forsook him, but carried off all his money. Disguised in rags, he wandered about in the mountains of Dalecarlia, till at length he found shelter as a labourer in the mines of Fahlun. After a short time Gustavus left the mines, and entered as a day-labourer into the service of a wealthy farmer at Wika, of the name of Fehrson; but he was soon recognised as the descendant of the kings of Sweden, and, through fear of Christian, was refused an asylum. Wandering in the middle of winter in this severe climate, he was in imminent danger of perishing through cold and want. Some peasants, who found him in a wood nearly frozen, brought him to Peterson, the owner of their village; but here also he was recognised, and while Peterson received him with apparent kindness, he betrayed his abode to the Danish commander of the district. Peterson's wife however, who abhorred the treachery of her husband, saved Gustavus, who fled to the house of a peasant of the name of Nilson, and concealed himself in a cart under a load of straw, with which Nilson was going to Rattwik, farther in the interior of Dalecarlia. On its way the cart was stopped by a party of Danish soldiers, who drove their pikes into the straw in different places. Erickson received a deep wound in the thigh; but fearing capture more than death, he endured in silence the danger and the pain, and succeeded in reaching Rattwik in safety.

Here Gustavus began his preparations for his great undertaking. With unwearied zeal he went from house to house, and from hut to hut, filling the hearts of the rough mountaineers with hatred against the tyranny of Christian. His eloquence was so powerful, that he soon found himself surrounded with a number of resolute combatants. With this force he marched towards Stockholm; his strength increased with each step, for every one participated in the disgust and hatred produced by the cruelties of the blood-thirsty Dane. In May 1521 Erickson was at the head of 15,000 men; and after a bloody battle, took the town and fortress of Westeras. Victory crowned the arms of the Dalecarlians, to whom the inhabitants of the plains of Sweden quickly united themselves. Christian exhausted himself in powerless threats, while one town after another fell into the hands of Gustavus. At length, after various vicissitudes, and after besieging it three times, Stockholm fell into the hands of Gustavus, and Christian was forced to withdraw to Denmark. The nation which he had freed, in their grateful enthusiasm, offered Gustavus the crown of Sweden, but he declined to accept the sovereignty over his countrymen. Under the title of Stadtholder however he conducted the government of Sweden. But the adherents of the Roman Catholic party and the expelled king of Denmark still continued to disturb the country by their intrigues, and the Swedes became convinced that it was only by the fixed authority of a monarchical form of government, and by putting the power in the hands of Gustavus, that their country could obtain peace and security. Accordingly they again solicited Gustavus to ascend the throne; and in June 1527 he was solemnly crowned king of Sweden, and thus became the founder of a new dynasty.

Gustavus Vasa reigned in Sweden upwards of thirty-three years. During this long period he displayed such virtues and talents for government, that he acquired fresh and imperishable claims upon the gratitude of his country; and his memory is still cherished by every Swede. He died in 1559, and was succeeded by his son Erik XIV. (Comte Selly, *La Vie de Gustave Erickson*, 1807; *Geschichte von Dalekarlien, aus dem Schwedischen*, 1813.)

GUSTAVUS ADOLPHUS, or GUSTAVUS II., King of Sweden, was born on December 9, 1594. He was the sixth monarch of the dynasty of Vasa, which, since the liberation of Sweden, in 1520, by its founder, Gustavus Erickson, reigned over the kingdom.

Gustavus Adolphus was the son of Charles, the youngest son of Gustavus Vasa. His father, Charles, had been declared king of Sweden to the exclusion of Sigismund, the heir of the elder line of the house of Vasa. Charles died October 30, 1611, leaving the Swedish sceptre to his son, then in his seventeenth year. Immediately on his accession the young king had sufficient opportunity for displaying his talents for government. Sigismund, whose father John, as the elder son of Gustavus Vasa, had occupied the throne of Sweden, had been elected king of Poland in his father's lifetime. On accepting the Polish crown, Sigismund abjured the Lutheran faith. This circumstance had offended the States of Sweden, and in consequence in the year 1599 he was declared to have forfeited his right of succession, and his uncle Charles, duke of Sudermania, was called to the throne. As long as Charles lived Sigismund never ventured to renew his claims to the throne of Sweden; but, upon his death, when he saw a youth of seventeen upon the throne, he thought that he should have an easy game against so inexperienced an adversary. Accordingly he invaded Sweden, and laid claim to the crown for his son Ladislaus, then a minor; but this war only served to develop the brilliant qualities of Gustavus. He fought successfully against the Czar of Russia, the ally of Sigismund, and also against Sigismund himself, until, by the mediation of England and Holland, a peace was concluded in 1629, upon the most advantageous terms for Adolphus. A great part of Livonia, and the important town of Riga, were on this occasion annexed to the territory of Sweden. These warlike exploits of the youthful king had drawn upon him the attention of all Europe, and it is not surprising that the eyes of the persecuted Protestants of Germany, who sighed under the tyranny of Ferdinand II. and the barbarous sword of his field-marshal Tilly, should have been directed towards the Swedish monarch for help and protection. The zeal of Gustavus Adolphus for the Protestant religion, and his compassion, excited by the almost unparalleled cruelties perpetrated upon the persecuted Protestants of Bohemia, were powerful motives for inducing him to aid the German Protestants in their resistance to Austria. But Gustavus felt the truth of the principle, that foreign intervention in the affairs of a country, though certainly welcome in a time of need, is, on that very account, ultimately disagreeable and even hateful. For this reason he printed a declaration, in which he endeavoured to prove to all Europe that he was not moved to the invasion of Germany by any improper desire to intermeddle in German affairs, but on account of the enmity already shown towards himself on the part of Austria. In particular he instanced the assistance given by this power to his enemies during the Polish war, and maintained that Austria had violated the territories of Sweden by entering them with hostile troops.

In pursuance of this declaration of war Gustavus Adolphus landed in Pomerania on the 24th June 1630. When he entered the mouth of the Oder his little squadron bore only sixteen troops of cavalry and a few regiments of foot, which altogether amounted to not more than 8000 men. With this small force however he made himself master of the islands of Usedom and Wollin, and pressed Bogislaw, the duke of Pomerania, so warmly, that he was compelled to agree to a treaty by which the town of Stettin was put in possession of the conqueror, and the whole country placed at his disposal.

The army of Gustavus was reinforced by the arrival of six English (or rather Scottish) regiments, under the conduct of the Duke of Hamilton, and he provided himself with money by raising a contribution of 50,000 rix-dollars in Pomerania. The fortress of Wolgast, which fell into his hands, furnished him with arms and ammunition, of which latter he began to be in much want. He next made himself master of the towns of Anclam and Stolpe, and thus opened for himself a road into the province of Mecklenburg. The attack of the Austrians under General Gütz on the Pomeranian town of Pasewalk, and the frightful cruelties perpetrated upon the inhabitants so near the Swedish army, exasperated the troops to the highest degree. Gustavus now resolved to prosecute his campaign with increased vigour. He divided his force into four parts. One division, under the Duke of Lauenburg, was ordered to the relief of Magdeburg; General Bauditz was sent to make an attack upon Kolberg; Horn was left with a garrison in Stettin; and Gustavus Adolphus himself encamped at Ribbenitz in the duchy of Mecklenburg. While lying there he received a letter written by the Emperor Ferdinand, containing proposals for peace, in which he made the most advantageous offers to the Swedish king, including the possession of Pomerania. Gustavus however replied that he had not entered Germany for his own aggrandisement, but to protect his fellow-Protestants. He therefore rejected these proposals and continued to make himself master of the towns and fortresses of Pomerania and Mecklenburg. By the end of February 1631, in the course of only eight months, he had already taken eighty fortified places; but the towns of Rostock and Wismar yet remained in the hands of his enemies. The emperor beginning to feel the danger which threatened him from Pomerania, sent against him Field-Marshal Tilly, at the head of the Imperial army. With varying fortunes Gustavus and Tilly struggled for vic-

tory; the Swedes suffered many defeats; yet the success which usually attended the arms of Tilly seemed to abandon him after he had delivered up the inhabitants of the town of Magdeburg to be plundered and murdered by his infuriated soldiers. The army of Gustavus pressed forward into the heart of North Germany. His forces continually increased, and the persecuted Protestants hastened to join his standard. His generals also, who had been acting separately, were victorious. Colberg, Werben, Königsberg, fell into the hands of the Swedes; General Pappenheim, whom Tilly had despatched with four regiments to protect Prussia, suffered a decisive defeat near Magdeburg; and Gustavus, collecting all his forces together, marched into the territories of the Elector of Saxony. On the 1st of August 1631, the Swedish army encamped near Witttemberg, where Gustavus received Count Arnheim, the ambassador of the elector. Through him a treaty was quickly concluded, by which the Saxon dominions were opened to the king of Sweden, and the whole military power of the electorate placed under his command; while at the same time the elector promised to provide the army with ammunition and provision, and to conclude no peace with Austria without the consent of the king of Sweden. Immediately on concluding this treaty Gustavus prepared to encounter Tilly, who had advanced against him to Eilmarschen. On the 7th of September 1631 they met on the plains of Leipzig. The collected force of the king of Sweden, to which the Saxon troops under Arnheim were joined, amounted to about 40,000 men; Tilly's army was somewhat more numerous. The victory was long doubtful between the two contending armies, led by two of the greatest military commanders of their time; but the enthusiasm of the Swedes, animated by the eloquence as well as the example of their heroic king, at length overpowered the Imperial troops, who fought only for fame or plunder. Tilly's defeat was complete; more than a third of his army remained upon the field of battle, and the remainder owed their safety to his firmness and military talents, which were displayed in a most difficult and admirably conducted retreat.

All Germany was now open to the Swedes, and Gustavus hastened forwards in an uninterrupted course of conquest. To his first ally the landgrave of Hesse he made over the country on the Weser, and to the elector of Saxony he promised part of Bohemia. He himself took possession of the beautiful district which lies betwixt the Rhine and the Main. But the progress of the Swedish arms excited the jealousy and apprehension of the whole German population. Even among the Protestants the national feeling was strong enough to make them lament the establishment of a foreign dominion upon the German soil. Gustavus also, whether justly or not does not appear, was accused of having designs on the Imperial crown. His allies became lukewarm, and the inhabitants everywhere viewed the Swedes with dislike. Upon the defeat of Tilly at Leipzig, and the Saxon army making itself master of Bohemia almost without opposition, the emperor Ferdinand became excessively alarmed, and called in Wallenstein, whom he had some time before dismissed, through the intrigues of the papal party, to oppose Gustavus in the field. Wallenstein, the most extraordinary man of his time, had scarcely received his commander's staff, when he drove the Saxons out of Bohemia, and threatened his adversary Gustavus Adolphus, who in the meantime had obtained a second victory over Tilly on the Leob, in which that general lost his life. Wallenstein took up a strong position in the neighbourhood of Nürnberg, by which he cut off all succours from the king of Sweden, and frustrated his plan of penetrating along the Danube through Bavaria into Austria. In fruitless attacks upon the camp of Wallenstein, and through hunger and disease, in the course of seventy-two days Gustavus lost 30,000 men. At length Wallenstein moved towards Saxony, and on the 1st of November 1632 he offered battle to his opponent at Lutzen.

The two armies engaged on the 6th of November. Gustavus opened the battle of Lutzen to the sound of music, with Luther's hymn, 'Eine feste Burg ist unser Gott.' He himself sang the words, and the army followed in chorus. He led the attack in person, descended at the critical moment from his horse, and killed the foremost of the enemy with a lance. While heading a second attack on horseback against the enemy's cavalry, a ball struck him from behind, and he fell. The horse, without its rider, flying through the Swedish ranks, announced the death of the king; but Duke Bernhard of Weimar crying out to the Swedes that the king was made a prisoner, inflamed them to such a degree, that nothing could resist their impetuosity, and after a frightful carnage the enemy was forced to retreat. The Swedes gained a victory, but with the loss of their king, whose body was found naked and bleeding upon the field. A strong suspicion of the crime of assassination rests upon his cousin the Duke of Saxe-Lauenburg, who at the moment of his fall was near him, and who shortly afterwards entered the Austrian service.

Thus ended the life of Gustavus Adolphus, one of the best men who ever wore a crown. He was simple and moderate in his private life, wise in the administration of civil affairs, and a most able commander. He died esteemed by all, even by his enemies, but lamented by no one, not even by those whom he had saved. The Roman Catholics rejoiced over the fall of their powerful adversary; and the Protestants, who now thought themselves strong enough without his help, were glad to be freed from a master whom they envied and suspected. But the war still raged for sixteen years after his death,

and Germany, groaning beneath the cruelties of a profligate soldiery, had frequent occasion to regret the memory, and to wish for the moderation and the discipline observed by the Swedish soldiers of Gustavus.

Gustavus Adolphus married, in 1621, Maria Eleonora, the sister of the Duke of Mecklenburg, by whom he had one daughter, Christina, who was his successor.

(Schiller; Westenrieder, *Geschichte des dreissig-jährigen Krieges*.)

GUSTAVUS III., King of Sweden, born in 1746, was the eldest son of Adolphus Frederic, duke of Holstein, who, in consequence of his marriage with Ulrica Louisa, the sister of Frederic II., had been called to the Swedish throne in 1743. On the 12th of February 1771, Gustavus III. succeeded to the crown on the death of his father. The country was at this time divided by two factions, the Hats and Caps, as the aristocratic adherents to the Russian or French policy respectively called themselves, who sacrificed the general good to their own interests. Both parties were detested by the people on account of their pride and oppression, and both parties were dangerous to the crown through their aristocratic privileges. Gustavus took the bold resolution of subverting both these parties with the assistance of the people, and of acquiring more power and importance to the crown, and giving more influence and effect to the democratic principle. With this purpose he endeavoured to gain the good-will of the militia by the institution of his new order of Vasa, and by bestowing preferment upon subaltern officers of talent. Prince Charles, the brother of the king, also travelled through the country, and secured the principal military chiefs to his interest. The execution of the king's plans against the States was commenced by the insurrection of the commandant of Christianstadt, who issued a violent proclamation against the States-General. Gustavus behaved as though he were much irritated at this step, and sent Prince Charles with a powerful force against Christianstadt, ostensibly to subdue the rebel, but in reality to unite with him. On the 19th of August 1772, the king began to follow out his plans in person. He entered into the assembly of the States, and fell into a violent dispute with some of the members. In the meantime his agents had secretly assembled all the military officers of the capital, and from the chamber of the States the king hurried to the meeting of officers. These officers, who had been long attached to his cause, received his plan for the abrogation of the States and the alteration of the constitution with loud applause. The different regiments were assembled under arms, and the soldiers, in the midst of continued cheers, swore inviolable obedience to the king. Gustavus next proceeded to arrest the heads of the parties and the most powerful members of the States, and publicly announced his plans for the abolition of the old and the establishment of a new constitution. On the same evening he received the congratulations of the foreign ambassadors, and gave a grand dinner to celebrate his success. The next day the magistracy of the capital took the oaths of fidelity, and the States-General were invited to assemble. Gustavus, having surrounded the assembly-house with soldiers and cannon, entered the assemblage accompanied by his military staff, in order to submit to them the proposed new constitution. This armed force was apparently sufficient to subdue every scruple of the assembly; but it must be acknowledged that this constitution only restricted and circumscribed the privileges of the nobility, and did not infringe the liberties of the citizens. It was accordingly received by the majority with real satisfaction, and confirmed by oaths and signatures. Those who had been arrested were immediately afterwards released, and the revolution was completed.

The nobility were silenced, but they nourished a secret hatred, which at length broke out in the year 1788, when by their intrigues they prevailed upon the States to refuse the supplies to the king while engaged in hostilities with Russia and Denmark. The fidelity of the Dalecarlians however, who proffered their services to the king, and repulsed the enemy from Gothenburg when it was hardly pressed, delivered the country. In order to free himself from the ever-active intrigues of the nobles, the king resolved upon a new *coup d'état*, which he carried into execution on the 3rd of April 1789, when he caused the leaders of the opposition in the Diet to be arrested, and a law to be passed, by which the royal prerogatives were very considerably increased. The first revolutionary measure of Gustavus was excusable on account of its patriotic object; but this second act of violence must be condemned as a selfish and arbitrary measure. After varying fortunes in the war, Gustavus concluded a peace on the 14th of August 1790 with his foreign enemies, that he might be at liberty to humble his domestic adversaries; but the nobility, who apprehended the loss of all their privileges, resolved upon his death. Accordingly they formed a conspiracy under the direction of Counts Horn and Ribbing and Colonel Lilienhorn, and a nobleman named Ankerstroem, whom he had personally offended, undertook to murder him. Ankerstroem chose a masked ball, which was given on the 16th of March 1792, at Stockholm, as the fittest opportunity for carrying his design into effect. The king was warned by some anonymous friend; but he went to the ball, and was pointed out to the assassin by Count Horn, who tapped him on the shoulder, and said "Good evening, pretty mask." Upon this Ankerstroem shot the king through the body from behind, and mingled with the crowd of masks. The king suffered with much firmness, and died on the 29th of March. His

murderer was discovered and executed, and many of the conspirators were banished out of the country.

Gustavus III. was a prince of very distinguished talents; his original intentions were noble, but prosperity corrupted him, and it became his object to acquire despotic power. It is noteworthy that this king, who as a statesman was so cool and self-possessed, was distinguished as a poet by his warmth of feeling and his fancy. He was the author of several highly-esteemed dramatic works; and in the Swedish Academy, of which he was a member, he displayed a high degree of eloquence in various discourses upon historical and philosophical subjects. Gustavus III. was a memorable example of a king uniting himself with the democratic party in order to oppose the encroachments of a powerful aristocracy. Had he been satisfied with his first success, and firmly secured to himself the sympathy of his people, the ambitious nobility, however unscrupulous, would hardly have ventured on the perpetration of such a crime.

(Posselt, *Gustav III. von Schweden*.)

GUSTAVUS IV., King of Sweden, was born on the 1st of November 1778, and, after the murder of his father Gustavus III., ascended the throne on the 29th of March 1792. This king, who by his conduct so completely alienated the national feelings, that, forgetting his great ancestors, they gave the throne of Gustavus Adolphus to a Frenchman, displayed, while a prince, a capricious humour and an obstinacy that bordered upon madness. He entered into a negociation for a marriage with the grand-daughter of the Empress Catharine of Russia, and suffered it to proceed so far that the whole court was assembled in order to be present at the solemn ratification of the marriage treaty. But instead of confirming the treaty, he departed secretly, and shortly afterwards married a German princess of the house of Baden. Of all the European monarchs he was the most zealous partisan of legitimacy, and he proposed, as the great object of his life, the restoration of the dethroned family of the Bourbons to the crown of France. In 1803 he made a journey through Germany in order to unite all the sovereign princes of the empire in arms against Napoleon I.; and to show his detestation of the usurper, he sent back to the King of Prussia the order of the Black Eagle, because the same distinction had been given to Napoleon. When Bonaparte concluded peace with Germany in 1806, Gustavus IV., through his ambassador, declared that he would no longer take any part in the proceedings of the Diet while it remained under the influence of a usurper. Nothing more was required to make him break off all diplomatic relations with the most powerful courts of Europe than an approach on their part to friendly relations with Napoleon. He thus involved his country in indescribable difficulties, irritated all his neighbours, and showed by his conduct that he would not scruple to sacrifice his people's welfare to his unreasoning obstinacy. His wars and negotiations exhausted the poverty of Sweden, and the inhabitants sighed beneath an intolerable burden of taxes. Even England, his only ally, whom he certainly could not reproach with any friendly feelings towards Napoleon, he contrived to offend by his conduct. Upon the English government sending him a message with some well-grounded complaints, he broke off with this power also, and ordered all the English ships in Swedish harbours to be laid under embargo.

The Swedes soon became tired of seeing themselves sacrificed to the extravagant follies of this Don Quixote of legitimacy, and the most influential patriots began seriously to consider how they could rescue their country from total destruction. Gustavus appears to have discovered through his spies that a storm was gathering about him, and either in order to avert it, or to make himself safe in any event, he endeavoured to possess himself of the funds deposited in the Bank of Sweden. At first he made an attempt to get the money into his hands by means of a proposed loan of eighty-two millions of Swedish rix-dollars (about twelve millions sterling), but as the bank commissioners refused to comply with this demand he resolved to carry his plan into effect by force.

On the 12th of March 1809 he repaired to the bank, accompanied by a detachment of military, with the intention of taking possession of the money deposited there. The commissioners of the bank had applied for protection to the Diet, and the Diet had directed Generals Klingspor and Adlerkreutz to divert the king from his intention by persuasion, or to prevent him by force. The generals met the king in the court of the bank buildings, and endeavoured to make him aware of the impropriety of his conduct; but Gustavus treated them as rebels, and ordered the soldiers to remove them from his presence by force. Adlerkreutz then advanced, seized the king by the breast, and cried with a loud voice—"In the name of the nation, I arrest thee, Gustavus Vasa, as a traitor." Of the soldiers who were present, about forty endeavoured to defend the king, but the majority followed the call of the general to carry into effect the orders of the Diet. Gustavus defended himself with desperation, and it was only by force that they could disarm him. He tore himself loose from the hands of the soldiers, and had very nearly escaped, but was again secured, and confined in an apartment, where for several hours he raged like a madman. Immediately upon the arrest of Gustavus, Duke Charles of Sudermania issued a proclamation, in which he announced that he had been called to the head of a regency, and exhorted the people to quietness till the decision of the States-General should be promulgated. On the 24th of March Gustavus was brought

to the castle of Griephelm, where he gave in his abdication. On the 29th there appeared the decision of the Diet, by which Gustavus IV. and his direct descendants were declared to have forfeited their rights to the Swedish crown, and the Duke of Sudermania ascended the now vacant throne of Sweden under the name of Charles XIII.

Gustavus left the Swedish territories very shortly after his deposition. During his exile he travelled through most of the countries of Europe, but lived chiefly in the little town of St. Gall, the capital of the Swiss canton of the same name. He assumed the name of Colonel Gustavson, and renounced all external obligations that might remind him of his former rank. He refused the appanage which Sweden offered him; he urged forward a suit of divorce from his wife, which he succeeded in obtaining on the 17th of February 1812; and he declined having any communication with his family, and obstinately rejected all assistance from them. He subsisted on the produce of his labours as an author, together with a little pension which he drew as a colonel.

Among his printed works, which appeared during his residence in Switzerland, one very systematically develops the mystical-religious and ultra-royal political tendencies of his mind. The moderation and discretion, as well as the stedfast tranquillity with which he endured his fall did him honour, and go some way towards atoning for the worse than follies through which he trifled away the possession of a throne. He was a martyr to his principles, which were founded upon his extravagant notions of the divine right of kings over their subjects.

He died at St. Gall, toward the end of the year 1837, lamented by all who had known him in the latter years of his life. His son, the heir of the line of Vasa, became a colonel of an Austrian regiment.

GUTENBERG, HENNE, or JOHN, was born at Mainz, or near it, about 1400. The family name was Gensfleisch or Günsfleisch, of honourable descent and of considerable property. Sulgloch was the name of an estate belonging to them near Mainz, where it has been stated that Gutenberg was born, and which he sometimes appended to his name as a title. The family also possessed two houses in Mainz, zum Günsfleisch, and zum Gutenberg, in which latter house he is reported to have carried on his printing business in partnership with Fust, and thence he derived the name by which he is best known.

It has been said that in his youth Gutenberg was implicated in an insurrection of the citizens of Mainz against the nobility, and was forced to fly to Strasburg. This story is not well authenticated, and is rendered the more doubtful by the fact that in 1430, in an accommodation between the nobility and burghers of Mainz, Gutenberg is named among the nobility "who are not at present in the country." It appears from a letter to his sister Bertha, written in 1424, that he was then residing in Strasburg, and there he appears to have remained many years, as from 1436 to 1444 his name appears among the civic nobility of that town. In 1437 an action was commenced against him for a breach of promise of marriage, but it is supposed that he married the lady; he certainly married a lady of the same Christian name, and there was no trial.

Gutenberg would appear to have had an inventive mechanical genius and to have exercised it in various directions. While at Strasburg he was applied to by several persons to teach them some of his arts and contrivances. One of these was the art of polishing stones, which he taught to a certain Andrew Drytzehen, who made a considerable profit thereby. Some time afterwards Gutenberg, in company with John Riff, "began to exercise a certain art whose productions were in demand at the fair of Aix-la-Chapelle." Drytzehen and two Heilmans applied to be made acquainted with it. Gutenberg assented, with regard to Drytzehen and one of the Heilmans, upon the condition of their each paying down eighty florins of gold, for which they were to receive a fourth of the profits between them; Riff was to have another fourth, and Gutenberg the remaining half. The fair was deferred for a year, when they petitioned to be made acquainted "with all his wonderful and rare inventions." Gutenberg assented, stipulating that each should pay 125 florins more, of which 50 were to be paid immediately, and the remaining 75 at three instalments. The partnership was to be for five years, and if any one of the partners died within that time, the survivors were to pay to the representatives of the deceased the sum of 100 florins for his share of the stock and utensils. Drytzehen paid only a part of his contribution, and died in about two years, when his brothers claimed the hundred florins, or that one of them should be admitted as a partner. Gutenberg pleaded, that as 85 florins remained unpaid of Drytzehen's contribution, that sum should be deducted, and the balance, 15 florins, he was ready to pay. This view was adopted by the judges, whose decision was given on December 12, 1439.

The chief importance of this trial however lies in the evidence of the various parties, showing that the "wondrous art," was in fact printing. Lead was one of the materials purchased. Some of the operations were carried on in Drytzehen's house, and upon his death, Gutenberg sent a message by his servant Beildeck to Claus Drytzehen stating that "your late brother has four pieces (stücke) lying beneath a press, and John Gutenberg prays you to take them out and off the press, and separate them, so that no one may see what it is." ("Andreas Dritzehen uwer bruder selige hatt iv. stücke undenan inn

einer pressen ligen, da hatt uch Hans Gutenberg gebettet das ir die darusz nemet, und uff die presse legent von einander, so kan man nit gesehen was das ist.") This witness, Hans Schultheiss, deposes also that A. Drytzehen had complained of the 'werck' having already cost him 300 guilders. Another witness, Conrad Sahspach, deposes that after Drytzehen's death, Gutenberg addressed him thus: "Go, and take the pieces out of the press and distribute (zerlege) them;" when he went however the work had been removed. He likewise mentions Drytzehen's complaint of the expense. Gutenberg's servant states that he was sent "to open (or undo) the press, which was fastened with two screws, so that the pieces (which were in it) should fall asunder." Heilmann, brother of one of the partners, proves that shortly before Drytzehen's death, Gutenberg had sent to "bring away all the forms (formen), that they might be separated in his presence, as he found several things in them of which he disapproved." One Hans Dünne, a goldsmith, also proves that, three years before, he had done work that "belongs to printing" ("das zu den trucken gehört"), to the amount of 100 guilders. It does not appear that Gutenberg succeeded in producing any printed books at Strasburg, but the above facts, we think, go far to prove that he possessed moveable types of metal; the use of technical terms still in use, being very remarkable. These details are taken from 'Vindiciae Typographicæ,' of J. D. Schœpflin, published in 1760. In the Appendix to that work he gives a summary of the testimony of the witnesses (of whom there were twenty-six produced on the part of Drytzehen, and fourteen for Gutenberg), and the judgment of the court. They are given in Latin and in old German, and we have used, with an exception here and there, the translations given in 'A Treatise on Wood Engraving; with upwards of 300 Illustrations on Wood, by John Jackson.'

Gutenberg's success in the law-suit does not seem to have rendered him the more prosperous. In 1441 and 1442, in order to raise money he sold some property in Mainz, which he had inherited from an uncle, to the collegiate church of St. Thomas in Strasburg, in which town he was still living. Somewhere about 1445 he appears to have returned to Mainz, and in 1449 he entered into partnership with Fust. It is in the following year that John Trithemius, who published his work 'On the Illustrious Men of Germany' in 1515, places the invention of the art. His account however is avowedly derived from Schœffer, and even he only claims the discovery of the more easy method of casting the types.

"At this time, in the city of Mainz on the Rhine in Germany, and not in Italy, as some have erroneously written, that wonderful and then unheard-of art of printing and characterising books was invented and devised by John Gutenberg, a citizen of Mainz, who having expended almost the whole of his property in the invention of this art, and on account of the difficulties which he experienced on all sides, was about to abandon it altogether, when, by the advice, and through the means, of John Fust, likewise a citizen of Mainz, he succeeded in bringing it to perfection. At first they formed [engraved] the characters or letters in written order on blocks of wood, and in this manner they printed the vocabulary called a 'Catholicon.' But with these forms [blocks] they could print nothing else, because the characters could not be transposed in these tablets, but were engraved thereon, as we have said. To this invention succeeded a more subtle one, for they found out the means of cutting the forms of all the letters of the alphabet, which they called matrices, from which again they cast characters of copper or tin of sufficient hardness to resist the necessary pressure, which they had before engraved by hand. And truly, as I learned thirty years since from Peter Opilio (Schœffer) de Gernsheim, citizen of Mainz, who was the son-in-law of the first inventor of this art, great difficulties were experienced after the first invention of this art of printing, for in printing the Bible, before they had completed the third quaternion (or gathering of four sheets), 4000 florins were expended. This Peter Schœffer, whom we have above-mentioned, first servant and afterwards son-in-law to the first inventor, John Fust, as we have said, an ingenious and sagacious man, discovered the more easy method of casting the types, and thus the art was reduced to the complete state in which it now is. These three kept this method of printing secret for some time, until it was divulged by some of their workmen, without whose aid this art could not have been exercised; it was first developed at Strasburg, and soon became known to other nations." The account of the wood-block printing may refer to Gutenberg's earliest attempts. The 'Catholicon Joannis Januensis' did not appear till 1460, is certainly not from wooden types or blocks, and is supposed to have been produced by Gutenberg after quitting Mainz: of such a 'Catholicon' as that spoken of there is no trace.

The partnership was brought to an end in 1455 by a law-suit commenced by Fust against Gutenberg for advances of money. The decision of the judges was pronounced on November 6, 1455. From the claim of Fust there scarcely seems to have been a partnership. He first advances 800 florins, at 6 per cent. interest, to purchase utensils for printing, and which were assigned to him for security; there is a second advance of 800 florins; and the 2020 florins claimed is made up of compound interest and charges for raising the money. Gutenberg's defence was, that he was not liable for the interest, and that the money was not advanced at the periods agreed upon. The

judges decided that Fust was to be repaid so much of the money advanced as had not been expended on materials; and Gutenberg, unable to raise the money, was forced to resign the printing-materials, and of course the invention, to Fust, who, with Schöffer, carried on the business. [FUST.]

Gutenberg however remained in Mainz, and continued to print. This is proved by a deed, dated July 20, 1459, in the possession of the University of Mainz, by which Gutenberg, in conjunction with his brother and three cousins, gives to the library of the convent of St. Clare, in which his sister was a nun, "all such books required for pious use and the service of God,—whether for reading, or singing, or for use, according to the rules of the order,—as I, the above-named John, have printed, or shall hereafter print," to remain for ever in the said library. There are no remains of this donation, nor is any book known to exist with Gutenberg's imprint; but the 'Catholicon Joannis Januensis,' as we have already mentioned, has been attributed to him. His merit was not altogether unacknowledged in his lifetime. In 1465 the archbishop elector of Mainz appointed him one of his courtiers, with the like allowance of clothing as to other nobles; and it could scarcely be on any other account than that of his invention. It is said that he became blind about this time, and resigned his printing materials to Bechtermunze and Spiess, who certainly printed some works with a type exactly similar to that used in the 'Catholicon'; one of these works, a vocabulary, appeared in 1467. On the other hand, a deed exists of a Dr. Conrad Homery, who was a creditor, dated the Friday after St. Matthias's day 1468, acknowledging the receipt of certain property "belonging to printing," left by John Gutenberg deceased. This date answers to February 19, 1468. The usual date given as that of his death is 1468, but it was probably towards the close of 1467. He was interred in the church of the Recollets at Mainz.

Posterity has endeavoured in some degree to make amends for the ill success of Gutenberg during his life. In 1837 a splendid monument in bronze, from the design of Baron von Lamsitz, was erected to his memory in Mainz. The Gutenberg Society, to which the writers of the Rhenish provinces belong, hold a yearly meeting also in Mainz to honour his memory and to celebrate his discovery.

GUTHRIE, WILLIAM, was born at Brechin, in the county of Angus, Scotland, according to one account, in 1701, according to another in 1708. He was educated at the University of Aberdeen; but little or nothing is known of his early years, except that it is said he was induced to leave his native country by a disappointment in love, on which he came to London, and commenced writing for the booksellers. He was one of the most popular compilers of his day, and must have been one of the most industrious writers ever known, if he was the author of all the voluminous works to which his name is prefixed. Among them are a 'History of England,' which though only brought down to the Restoration, extends to three thick folio volumes; a 'History of Scotland,' 10 vols. 8vo; a 'General History of the World,' 13 vols. 8vo; a 'History of the Peerage,' 1 vol. 4to; a translation of the 'Institutes of Quintilian,' 2 vols. 4to; translations of nearly all the writings of Cicero; 'The Friends,' a novel, in 2 vols. 8vo; 'Remarks on English Tragedy,' &c. But in the preparation of most of these works he is believed to have had little share, beyond lending them his name, which it would appear was in repute with the booksellers. The well-known 'Geographical Grammar' which bears his name is believed to have been compiled by a bookseller in the Strand, of the name of Knox. Guthrie found the trade of authorship not an unprosperous one; and to what he gained with his pen was, in course of time, added a pension from government, which it may be supposed he earned by some writings acceptable to the court, or by other unknown political services. He was also placed in the commission of the peace for Middlesex, although it is said he never acted as a magistrate. He died in 1770. Guthrie's 'General History of England, from the Invasion of the Romans under Julius Cæsar to the late Revolution in 1688,' which is the historical work of which his claim to the authorship is the most undoubted, is written in a style by no means without warmth and animation, though it has not much claim to the praise either of condensation, judgment, or research. The author is rather fond of new and peculiar views—one instance of which that may be mentioned is the light in which he endeavours to place the conduct and character of Richard III., many of the common stories in regard to whom he disputes in a manner that led him afterwards to claim the honour of having anticipated nearly all that was most remarkable in Horace Walpole's 'Historical Doubts.' But in truth both he and Walpole had been long before preceded in the same line of argument by Sir George Buck: yet oddly enough, within the last few years the theory has been again revived with some little parade of originality.

GUTHRY, HENRY, a Scottish ecclesiastic, was the son of John Guthry, clergyman of Cupar Angus in Forfarshire, where he was born soon after the commencement of the 17th century. He studied at St. Andrews, and when he became capable of holding a benefice, he was presented to the church of Stirling. In 1638 he subscribed the Covenant, but he is said never to have had much sympathy with its promoters, and he was inclined to neutrality in the discussions which followed. In 1647 he was one of those who joined the 'Engagement' for the support of Charles I. against the Parliament, a course of

conduct which occasioned his deposition from the ministry. He was succeeded by a celebrated namesake, apparently a member of the same family, James Guthry, who having shown a resolute hostility to Charles II., his followers, and his ecclesiastical policy, was beleagued after having been convicted on a charge of high treason in 1661. The more moderate or cautious Henry was then restored to the benefice. He conformed to the re-establishment of Episcopacy, and was appointed bishop of Dunkeld in 1665. He died in 1676, leaving behind him a manuscript 'History of his Own Time,' which was published in 1748. (*Life*, by George Crawford, prefixed to *Memoirs of Henry Guthry, late Bishop of Dunkeld.*)

* GUYON, GENERAL. RICHARD DEBAUFRÉ GUYON was born March 31, 1813, at Walcot, near Bath, Somersetshire, in which city he received his early education. His grandfather was a captain in the Dragoon Guards; his father, John Guyon, of Richmond, Surrey, was a commander in the royal navy, and died in 1844. Richard Guyon was intended for the army, and at an early age held a commission in the Surrey militia. At the age of eighteen he obtained a commission in the Hungarian Hussars of the Austrian army, and after some years' service attained the rank of lieutenant, and was appointed aide-de-camp to Field-Marshal Baron Splenyi, commander of the Hungarian life-guards. In November 1838 he married the daughter of Baron Splenyi, and soon afterwards retired to the neighbourhood of Pesth, where his wife's relations resided, and where he spent his time in country-occupations and field-sports.

In September 1848, when Jellachich, the Ban of Croatia, invaded Hungary, Guyon offered his services to the Hungarian diet, and received the appointment of Major of the Honveds, or national guards. On the 29th of September he contributed materially to the defeat of Jellachich at Sukoro. In the battle of Schwechet, near Vienna, on October 30th, Major Guyon with his raw troops achieved at Mannswoth the only successes of that disastrous day, when his horse having been shot under him, he led his men to the charge on foot, and armed them with the muskets of the slain Austrians, in place of the scythes with which many of them had fought. He was rewarded by being raised to the rank of Colonel on the field of battle. He was afterwards raised to the rank of General at Debreczin. He commanded the rear of Görgei's army on the march from Pesth to Upper Hungary; and at Ipolszag (January 10, 1849), by a daring and skilful effort, saved the baggage from the pursuing Austrians. On the 5th of February, with 10,000 Hungarians, he stormed the defiles and heights of Branyiszko, defended by 25,000 Austrian troops under General Schlick, took prisoners and baggage to a large amount, and cleared the way for the van of the army to pass, Görgei having vainly attempted to turn the defiles by a flank movement. At the battle of Kapoina (February 26) he commanded a division of Dembinski's army. On the 21st of April he entered the fortress of Komorn with a small body of troops, though it was then closely besieged by the Austrian troops, and announced to the despairing garrison the approach of Görgei with a relieving army. When Görgei was appointed minister of war, General Guyon for a time performed the duties of the office, in order to enable Görgei to retain his command-in-chief. On the 9th of August the Austrian and Hungarian armies met near Temesvar, where the impetuous bravery of Guyon and his Hussars could not save the Hungarian army from a defeat. On the 11th of August Kossuth resigned his office of governor, and named Görgei dictator, who on the 17th of August put an end to the war by an unconditional surrender.

Guyon, Bem, Dembinski, Kmety, and other officers who had not been included in the surrender, made their escape with much difficulty to Turkey, where, in defiance of the conjoint demand of Austria and Russia, they were protected by the sultan. After some time Guyon was joined at Constantinople by his wife, whose property in Hungary had been confiscated by the Austrian government. He was offered and accepted service under the Turkish government; and though he decidedly refused to become a Mohammedan, was sent to Damascus with the rank of lieutenant-general on the staff, and with the title of Kourschid Pasha. In November 1853 he was directed to proceed from Damascus to the army in Asia Minor, and reached Kars by a series of rapid journeys. There he had the appointment of chief of the staff and president of the military council, but without any real command over an army of 15,000 undisciplined troops under twenty-one pashas, each with the rank of a general. He was allowed however to organise the army and to construct defences. That organisation and those defences, though doubtless much improved afterwards by General Williams and his officers, became a basis for the heroic defence of Kars.

(*The Patriot and the Hero; General Guyon on the Battle-Fields of Hungary and Asia*, by Arthur Kinglake.)

GUYON, JOHANNA-MARIE BOUVIERS DE LA MOTHE, was born on the 13th of April 1648, at Montargis, in the department of Loiret. At seven years of age her father sent her to the Ursuline Convent, where she soon distinguished herself by her talents, and by her remarkable attention to her religious studies. She wished to take the veil before she was seventeen, but her parents opposed this, as they had promised her in marriage. While residing in the convent, in order to have the name of Jesus on her heart, "with ribbands and a big needle she fastened the name in large characters to her skin in four

places." At a little past fifteen she was married to M. Guyon, whom she had not seen till two or three days before her marriage. The union was not a happy one; the husband was passionate, and twenty-two years older, and the mother-in-law insulted her. She says she prayed continually, and when her husband was suffering from the gout nursed him carefully, and ultimately succeeded in converting him to her religious views. At the age of twenty-eight she lost him, and was left a widow with three small children in 1576. Though now attentive to the temporal interests and the education of her children, her religious feeling increased in intensity. She believed that she had occasionally interior communications of the divine will, but was deeply distressed about the state of her soul. In 1680, on St. Magdalene's Day, on occasion of a mass, she says "my soul was perfectly delivered from all its pains." She soon after went to Paris, was exhorted in what she considered a miraculous manner to devote herself to the service of the Church, and went to Geneva to succour the Catholics there, but ultimately settled at Gex in 1681, in an establishment founded for the reception of converted Protestants. Her family then urged her to resign the guardianship of her children, which she did, giving up all her fortune to them, retaining only sufficient for her subsistence. Soon after the Bishop of Geneva wished her to bestow this pittance upon the establishment, of which she was to be made prioress. She declined, and left Gex for the Ursuline convent at Thonon. Here the bishop continued to annoy her; and she went first to Turin, then to Grenoble, Marseille, Alessandria, afterwards to Verceil, and at length, after an absence of five years, returned to Paris in a very ill state of health. During all this time she had had dreams, visions, and marvellous manifestations. She had read the scriptures diligently, and wrote explications of them; "before I wrote I knew nothing of what I was going to write, and after I had written I remembered nothing of what I had penned," she says, in the singular autobiography which she has left of herself. Two other of her works of this period were, 'Moyen court et très facile de faire Oraison,' which was published, and rapidly ran through five or six editions, and 'Le Cantique des Cantiques de Salomon, interprété selon le sens mystique.' Though the works were highly popular, they gave great offence to the priesthood. They inculcated what was then called Quietism, a mystic state of repose of the mind in the goodness and mercy of God. It was the persecution of the priests that had caused her frequent changes of residence, and on her return to Paris she was confined, on their representations, by a *lettre de cachet*, in the convent of the Visitation of St. Mary, in the suburb of St. Antoine. Here she was visited and examined by M. de Harlai, archbishop of Paris, who, convinced of her innocence, obtained her release after an imprisonment of nearly eight months. Soon after her release she became acquainted with Fenelon, who continued her firm friend for life. The outcry of the priests however continued; she felt uneasy as to the character of her writings, and placed them in the hands of Bossuet, bishop of Meaux. He was satisfied as to her sincerity; but the priests succeeded in procuring a commission to examine her doctrines anew, of which Bossuet was at the head. At the end of six months thirty articles were drawn up by him, sufficient, as he deemed, to prevent the mischief likely to arise from Quietism, which were signed by Madame Guyon, who submitted at the same time to the censure which Bossuet had passed on her writings in the preceding April. Notwithstanding this submission, she was subsequently involved in the persecutions of Fenelon, the archbishop of Cambrai, and in 1695 was imprisoned in the castle of Vincennes, and thence removed to the Bastille, enduring the harshest treatment, and subjected to repeated examinations. In 1700 she was released, when she retired to Blois, to the house of her daughter, where she wrote so continuously that her works form 39 volumes in 8vo. She had written her autobiography previously, which Cowper translated, and of which he has said, "she will be found to have conversed familiarly with God." Of another of her works, 'Cantiques Spirituels, ou d'Emblèmes sur l'Amour Divin,' he has also said, that though she was accused of being a Quietist and a fanatic, yet he admired them, for "her verse is the only French verse I ever read that I found agreeable, and there is a neatness in it equal to that which we applaud with so much reason in the compositions of Prior." He translated many of them, which are still highly esteemed by the holders of certain religious opinions. She died on the 9th of June 1797.

Madame de Guyon's was a singular character. Her enthusiasm was excessive, but sincere. Her life was passed in the exemplary discharge of every duty, and she even submitted her opinions to the authority of her Church; but her reason was too clear, her faculties too keen, to allow her to see through other eyes than her own, and thence the opposition she met with. With a vivid imagination often approaching hallucination, she possessed a strong common sense that preserved her from the last excesses of extravagance; and while she rejoiced in being a martyr for religion's sake she had sufficient sagacity to secure the enjoyment of the sober elegancies of life. Her autobiography is a remarkable work, and affords an interesting history of a mind; it is full of earnest and thoughtful prayers, which are often rhapsodical and sometimes poetical; of a mind that converted coincidences into marvels and spiritual manifestations, and accepted deep impressions as divine inspirations with the most undoubting faith. It is no wonder that it became a favourite with Cowper. His trans-

lation was never published, but a mutilated one has since appeared by J. D. Brooke, printed in 1806. Her doctrines had many followers, and are even now not extinct; and her prayers and experiences are still admired by many who are in no sense her followers.

GUYTON DE MORVEAU, LOUIS BERNARD, a chemist of very considerable reputation, was born on the 4th of January 1737, at Dijon, in the university of which his father was professor of civil law. In very early life he showed a turn for mechanics, and after studying at home he went to college, which he quitted at sixteen years of age; he then became a law student for three years in the university of Dijon, and afterwards repaired to Paris to acquire a knowledge of the practice of the law. At the age of twenty-four he had pleaded several important causes, and his father purchased for him the office of advocate-general in the parliament of Dijon; he soon afterwards was admitted an honorary member of the Academy of Sciences of Dijon. His taste for chemistry seems to have arisen from his attendance upon the lectures of Dr. Chardenon, who was in the habit of reading memoirs on chemical subjects; and, without neglecting the cultivation of literature, he applied himself with great diligence to the study of chemistry.

In 1772, having previously published some less important papers, he gave to the world a collection of scientific essays, entitled 'Digressions Académiques;' the memoirs contained in this work on phlogiston, solution, and crystallisation merit particular notice, and evince the superior knowledge which he had acquired on the subjects that he had undertaken to illustrate.

In the following year he achieved the important discovery of the means of destroying infection by acid vapours, and of all his labours it is this for which his name will be transmitted to posterity with those of the benefactors of mankind. In one of the churches of Dijon a practice had prevailed of burying the dead in considerable numbers within its walls; this proceeding occasioned an infectious exhalation, which brought on a malignant disorder, to the great alarm of the inhabitants of the city. When other attempts to remedy this evil had failed, it occurred to Morveau that the vapours of muriatic acid might be successfully employed to remove it. With this view he made a mixture of sulphuric acid and common salt, in wide-mouthed vessels, which were placed upon chafing-dishes, and in different parts of the edifice; after closing the windows and doors for twenty-four hours, and then suffering the air freely to pervade the building, no remains of the fetid smell were perceptible, and the church was cleared from infection. The same process was tried on other occasions, and the practice is still continued, with the improvement of substituting chlorine gas for muriatic or hydrochloric acid gas.

Although this was probably the first employment of muriatic acid gas as a disinfectant on a large scale, and with results so striking as those detailed, it appears nevertheless, that Dr. Johnstone of Worcester had recommended the use of the same gas for this purpose in the year 1756; it is even stated that he employed it in the prison of Worcester, but he does not seem to have published his process before the appearance of Morveau's tract on the subject.

In 1766 Morveau commenced a course of lectures on chemistry in Dijon, which met with great success, being delivered with clearness and illustrated by numerous and striking experiments. In the year following he published the first volume of a course of chemistry, entitled 'Elémens de Chimie de l'Académie de Dijon;' the work was completed in four volumes. He afterwards undertook to supply the chemical articles for the 'Encyclopédie Méthodique;' the articles 'acide,' 'adhésion,' and 'affinité' contain a vast body of information clearly drawn up; for reasons which are not known, he discontinued his connection with this work. A paper which he published in the 'Journal de Physique' for 1782, on the necessity of establishing a new and scientific nomenclature, had a great share in producing the reformation in chemical nomenclature rendered necessary by the establishment of the antiphlogistic theory, and by the numerous new facts which had been discovered.

On the breaking out of the French Revolution Guyton de Morveau was made a member of the Constitutional Assembly and of the Council of Five Hundred. In 1799 Bonaparte appointed him one of the administrators-general of the mint, and in the year following director of the Polytechnic School; and after being an officer of the Legion of Honour he was created a baron of the French empire in 1811. At an advanced period of life he married Madame Picardet, the widow of a Dijon academician; he left no children. After teaching about sixteen years in the Polytechnic School he gave up the appointment; and after about three years' retirement he died on the 3rd of January, 1816.

The publication of Guyton de Morveau on chemical subjects are very numerous, and few of his contemporaries contributed more to the advancement of the science; he was however not the author of any striking or fundamental chemical discoveries. His papers may be found in the 'Memoirs of the Dijon Academy,' the 'Annales de Chimie,' and the 'Journal de Physique.'

GWILT, GEORGE, architect, was well known as an antiquary, and for his restoration of the choir and tower, and the Lady Chapel, of St. Mary Overy's church, in the parish of St. Saviour's, Southwark. George and Joseph Gwilt [GWILT, JOSEPH], were the sons of George Gwilt, an architect, resident in the parish, who was surveyor for the

county of Surrey, and who erected, amongst other buildings, Horse-monger Lane Gaol and Newington Sessions House. He died on the 9th of December 1807. George Gwilt, the elder of the sons, was born on the 8th of February 1775. He was sent to a school at Hammer-smith, but was indebted for his general education mainly to his own exertions. His professional knowledge was acquired in the office of his father, whom he succeeded in practice. Prior to this however, Gwilt junior had commenced his own professional course with the building, about the year 1801, of the warehouses of the West India Docks. He soon acquired a marked taste for objects of antiquarian art, of which he at length got together, at his house in Union Street, an important collection, many of the remains being found in St. Saviour's. In 1815 he was elected a Fellow of the Society of Antiquaries. In March and June of that year two valuable communications by him, on the remains of Winchester Palace, Southwark, appeared in the 'Gentleman's Magazine'; and he contributed occasionally at other times to the same journal. In 1818 he was engaged upon the restoration of the steeple of Bow Church, a work which required much professional skill, and which he performed with strict regard to the preservation of Wren's design. The peristyle of columns and the obelisk had to be removed and rebuilt, and the whole was completed on the 11th of July 1820, when the copper vane (in the form of a dragon), eight feet ten inches long, was fixed. Very soon afterwards, the foundations of the same church being found defective, some important works for their maintenance were carried out under Gwilt's supervision; and during these works the interesting Norman remains of the original building were identified, and were described by him to the Society of Antiquaries in June 1828, in a paper under the title of 'Observations on the Church of St. Mary-le-Bow, chiefly relating to its Original Structure,' and which paper was afterwards published, with six plates, in the 'Vetusta Monumenta,' vol. 5. The restoration of the choir and tower of St. Mary Overy's church was commenced about the year 1822, and was completed in about two years, with great fidelity and practical skill. In 1824 Gwilt visited Italy, and we find little to say of him till the year 1832, when the Lady Chapel of the church last mentioned being rescued from destruction, he undertook the direction of the restoration without remuneration, and completed it in 1833, with the skill which he had exhibited in the other part of the church. George Gwilt lived to the advanced age of eighty-one, occupied in his favourite pursuits till within a few days before his death. He had however suffered long from a painful complaint, and the loss of his wife, who died a few weeks before him, was severely felt. He died on the 27th of June 1856, and was buried in the family vault, next the choir of St. Mary Overy's Church. Charles Edwin, the second of his three sons, has contributed to the 'Archæologia' (vol. xxv.) an Account of the remains of part of the Prior of Lewes's house in Carter Lane, St. Olive's, Southwark.

* GWILT, JOSEPH, architect, and author of works on architecture, some of which are standard books of reference, was the younger brother of the subject of the foregoing notice, and was born on the

11th of January 1784. He was brought up to his profession with his father, and appears to have devoted his chief attention to the Italian and classical styles. He had however no opportunity for going to Italy till after the termination of the war, when his visit in 1816 led to the publication in 1818 of his 'Notitia Architectonica Italiana,' consisting of concise notices of buildings and architects in Italy, which he had prepared for his private reference during his journey. In 1822 he privately printed a 'Cursory View of the Origin of Caryatides.' About the same time he published a book entitled 'Sciography, or Examples of Shadows,' of which a second edition dates in 1824; and he also issued 'A Treatise on the Equilibrium of Arches,' of which the second edition appeared in 1826. In 1825 he edited an edition of Sir William Chambers's 'Treatise on Civil Architecture,' in 2 vols. large 8vo, with carefully-reduced plates and many valuable notes; and to the work itself he prefixed an illustrated section on Grecian architecture, together with an inquiry into the qualities of the beautiful. In 1826 he published his 'Rudiments of Architecture, Practical and Theoretical,' and in the same year a translation of the 'Architecture' of Vitruvius, which is the only complete translation of the ten books, in the English language, which has any merit. In 1837 Mr. Gwilt published a small octavo under the title, 'Elements of Architectural Criticism for the Use of Students, Amateurs, and Reviewers,' wherein he opposed the opinions as to the merits of the modern German school which had been put forth in several articles in the 'Foreign Quarterly Review.' For the reference which there and elsewhere he has made to the critics, he has hardly been forgiven; and the controversy, in which neither side was wholly right, has been productive of many subsequent expressions of opinion not exactly tending to more accurate views of art amongst the public. In 1833 was privately printed, 'A Project for a National Gallery, by Joseph and J. S. Gwilt.' In 1842 Mr. Gwilt contributed the articles on art to Brande's 'Dictionary of Literature, Science, and Art,' and in the same year appeared his excellent 'Encyclopædia of Architecture, Historical, Theoretical, and Practical.' A second edition of the latter work appeared in 1851, together with an appendix on Gothic architecture, and a third edition was published in 1854. In addition to these literary works, Mr. Gwilt is the author of 'Rudiments of the Anglo-Saxon Tongue,' and he wrote the article 'Music' in the 'Encyclopædia Metropolitana.'

Mr. Gwilt's principal work in the practice of his profession was Markree Castle, near Sligo, in Ireland; and his latest work is a church at Charlton, near Woolwich, in the Byzantine style, dedicated to St. Thomas. He has also designed and executed some alterations and additions to the hall of the Grocers' Company, to which company he has held the appointment of architect for thirty years and upwards. Mr. Gwilt also was for forty years or more one of the surveyors of the sewers in Surrey, having succeeded his father in the office; but was superseded, along with others, on the altered arrangements for the metropolis under the new commission appointed in 1843, to whose views of improvement, particularly in respect of the small-pipe system for main sewerage, he was wholly opposed.

H

HABAKKUK, one of the twelve minor Hebrew prophets. We have no particulars respecting the place and time of his birth; but it appears probable that he prophesied in the beginning of the reign of Jehoiakim (B.C. 609). It is evident from the prophecy that Jerusalem had not yet been taken by the Chaldeans, but that Judæa had been overrun by their armies. We learn from 2 Kings, xxiv. 1, that the Chaldeans under Nebuchadnezzar made Jehoiakim tributary to them at the beginning of his reign; but Jerusalem was not taken till the reign of his successor Jehoiachin. Clement of Alexandria ('Strom,' i. 142) places Habakkuk in the reign of Zedekiah, which agrees with the account in the apocryphal story of Bel and the Dragon, according to which Habakkuk lived in the time of the Babylonian captivity.

The prophecy of Habakkuk may be divided into two parts. The first is in the form of a dialogue between God and the prophet: the prophet begins by deploring the desolate condition of Jerusalem (i. 1-4); God is then introduced foretelling the destruction of the Jewish state by the Chaldeans (i. 5-11); the prophet replies by expressing a hope that the Jews may not be entirely destroyed, and that the Chaldeans may be punished, since they are as wicked as the Jews (i. 12-17; ii. 1); God assures the prophet that the captivity of the Jews will only last for an appointed time, and that the Chaldeans would eventually be punished on account of their iniquities (ii. 2-20). The second part is a prayer, or psalm, in which the prophet recounts the wonderful works God had wrought on behalf of his people in past times, and prays unto Him to preserve the Jews in their captivity, and "in wrath to remember mercy" (c. iii.).

The prophecy of Habakkuk is written in an energetic style, and contains many beautiful passages. The third chapter is considered by Bishop Lowth as one of the finest specimens we possess of the Hebrew ode.

The canonical authority of the book has never been disputed. It is quoted in the New Testament: compare Hab. ii. 4 with Rom. i. 17, BOG. DIV. VOL. III.

Gal. iii. 11, Hebr. x. 38; and Hab. i. 5 with Acts xiii. 40, 41. Many divines consider the passage ii. 2-4 to be a prophecy relating to the Messiah, implying also the deliverance of the Jews by Cyrus; but till the scheme of secondary prophecies (that is, of making the same prophecy fulfilled by two distinct and different events) is better established, we must withhold our assent to such a hypothesis.

HABINGTON, WILLIAM, was the son of Thomas Habington, a Roman Catholic gentleman of family and fortune in Worcestershire. His mother, the daughter of Lord Morley, has been supposed to have been the writer of the famous letter which revealed the Gunpowder Plot [FAWKES, GUIDO]; and her husband (who had been long imprisoned as implicated in Babington's conspiracy) gave shelter to some of the accomplices of Fawkes, and was sentenced to die, but received a pardon through the intercession of his wife's brother, on condition of retiring to his manor of Hindlip. Their son had been born there upon the very day now marked as the date of the plot, the 5th of November 1605. He was educated in the Jesuit college of St. Omer, and afterwards at Paris; and endeavours were used, but in vain, to induce him to enter the society. He returned to England, and lived in retirement with his father, who long survived him, and who directed and co-operated with him in historical and other studies. William Habington married Lucy, daughter of William Herbert, the first Lord Powis; and the whole of his subsequent life appears to have been spent in literary and rural quiet. It is said by Anthony Wood that he "did run with the times, and was not unknown to Oliver the Usurper," a charge which may either be untrue or involve nothing discreditible. He died at Hindlip on the 13th of November 1645, when he had but just completed his fortieth year. His published writings were the following:—1, 'Castara,' a collection of poems, first printed together in 1635, and again more fully and correctly in 1640. They were included in Chalmers's 'English Poets' in 1810, were reprinted separately in 1812, and are given wholly in

Southey's 'Select Works of the British Poets.' The name at the head of them is the poetical one he gave to the lady whom he married. They are in three parts: the first containing sonnets and other small pieces, chiefly addressed to his mistress before marriage; the second part containing similar poems, chiefly addressed to her as his wife; and the pieces in the third being mainly religious and contemplative. 2, 'The Queen of Arragon, a Tragi-Comedie,' acted both at court and at the Blackfriars theatre against the author's will, printed in 1640, folio, brought again upon the stage in 1668, with a prologue and epilogue by the author of 'Hudibras,' and reprinted in all the three editions of Doddsley's 'Old Plays.' 3, 'The History of Edward IV.,' 1640, fol., said to have been partly written by his father. 4, 'Observations upon History,' 1641, 8vo.

Habington's poems, although infected by the tendency to puerile and abstruse conceit which prevailed in his time, are yet in most parts exceedingly delightful. Their fancy is sweet, especially in rural description; their feeling is refined and ideal; the language is correct and tasteful; and the tone of moral sentiment is everywhere pure and elevated. The romantic and chivalrous cast of thought and sentiment gives much interest to his play, although the story is meagre, and the characters are not vigorously depicted.

HABSBURG, THE HOUSE OF, was the original title of the House of Austria. Rudolf, the founder of the Austrian dynasty, was born in 1218, and was the son of Albert, count of Habsburg in Aargau, and of Hedwige of Kyburg, who was descended through her mother from the once powerful House of Züringen. In his youth he was engaged in frequent warfare with the neighbouring barons, and with the banditti who infested his own or the neighbouring territories, and afterwards he served under Ottocar, king of Bohemia, against the Prussians and the Hungarians. In 1261 Rudolf succeeded to the rich inheritance of his uncle, Hartmann the Elder, count of Kyburg, which included the greater part of the Aargau, and portions of the present cantons of Bern, Lucern, Zürich, and Zug, besides the advocacy or protectorship of the Waldstätter, or forest cantons. By this inheritance Rudolf, whose domains were at first very limited, became lord of considerable territory, though he was by no means equal to the great electoral princes of Germany. But he found a powerful friend in Werner, archbishop of Mainz, who was so pleased with the abilities, the wisdom, and justice which Rudolf displayed in the administration of his enlarged territories, that he cast his eyes upon him as a fit occupant of the Imperial throne. The archbishop sounded the other electors, and won them all over to his views, except Ottocar, king of Bohemia, whose ambassadors protested, though in vain, against Rudolf's election, which took place at Frankfurt in 1273. Rudolf was then besieging Basel, the burghers of which city had killed some of his relatives in an affray. On the news of his elevation the people of Basel were the first to hail him as the head of the empire and to swear allegiance to him, and Rudolf hastened to Aix-la-Chapelle, where he was crowned king of the Romans by his friend the archbishop of Mainz. The next thing was to have his election acknowledged by the papal see, and here no difficulty was found. Gregory X., then pope, was a man of a moderate disposition and conciliatory temper, and he willingly acknowledged Rudolf as head of the Western empire, while Rudolf on his part made several concessions: he renounced all jurisdiction over Rome, all feudal superiority over the marches of Ancona and the duchy of Spoleto, all interference in ecclesiastical elections, and, excepting the right of temporal investiture of newly-elected bishops, which he retained, he acknowledged the independence of the Germanic church on the crown. This was a happy termination of the quarrel of two centuries' duration between the church and the empire. Rudolf turned next to Ottocar, king of Bohemia, who refused allegiance to him. Ottocar, besides Bohemia, had taken possession of Moravia, Austria, Styria, Carinthia, in short, of the greatest part of the present Austrian empire. Rudolf laid siege to Vienna, and crossing the Danube on a bridge of boats, defeated Ottocar, who sued for and obtained peace by giving up Austria, Styria, Carinthia, and Carniola. Rudolf confirmed him in the possession of Bohemia and Moravia. Rudolf appointed his two surviving sons, Albert and Rudolf, joint-dukes of Austria and Styria, giving Carinthia to Meinhard, count of the Tyrol, whose daughter had married his son Albert, but stipulating for the right of reversion to his own family in the event of the extinction of Meinhard's male posterity. Ottocar having soon after revolted, was again defeated and killed in battle, and his son Wenceslaus, who had married a daughter of Rudolf, succeeded him as king of Bohemia, and continued the peaceful liege of his father-in-law. But the great merit of Rudolf is that of having restored order and tranquillity in the internal administration of Germany. In successive diets he compelled or persuaded the princes to submit their differences to arbitration, to swear to the observance of the public peace, and to consent to the demolition of the fortresses which had been erected by the nobles for plunder as well as for war. In one year he razed seventy of these strongholds, and he condemned to death no fewer than twenty-nine nobles of Thuringia, who still presumed to disturb the public peace. Rudolf granted a number of charters to many towns and rising municipalities. His reign exhibited a remarkable novelty for Germany—internal tranquillity. His probity became proverbial, and his respect for religion is attested by many facts. He forgot personal wrongs, and gratefully rewarded personal

services, especially in those who had rendered him assistance in his early life, and he was accessible to the humblest of his people.

Rudolf I. died in 1291, in a good old age, leaving only one surviving son, Albert, besides several daughters. His other son, Rudolf, died before his father, leaving one son, John, under Albert's guardianship. Albert I., duke of Austria, was elected emperor in 1298, and was murdered at Windisch, in Aargau, by his nephew John, to whom he would not give up his paternal inheritance. [ALBERT I., DUKE OF AUSTRIA.] He left a numerous progeny. His eldest son, Rudolf, married the widow of Wenceslaus, and succeeded to the crown of Bohemia in 1306, but died shortly after. Albert's second son, Frederick the Handsome, duke of Austria, died in 1330, without issue. His brother Leopold, who shared with Frederick the administration of the Austrian dominions, marched against the Swiss, and was defeated by them at the battle of Morgarten, 15th November 1318. He died in 1326. Albert's fourth son, Albert II., called the Wise, succeeded his brother Frederick as duke of Austria and of Styria, and died in 1358, leaving a numerous family. His eldest son, Rudolf III., duke of Austria, became, in 1363, count of Tyrol and Carinthia by the extinction of Meinhard's male posterity, and died in 1365. He was succeeded by his brother Albert III. jointly with his other brother, who is styled Leopold II., and who fought against the Swiss, and was defeated and killed at the battle of Sempach, 9th July 1386. Albert himself died in 1395, leaving his dominions divided between his two sons: the elder, Albert IV., became duke of Austria, and the other, Leopold, duke of Styria and Carinthia. Albert IV. died in 1401, and was succeeded by his son Albert V. of Austria, who married Elizabeth, daughter of the Emperor Sigismund, whom he succeeded as king of Hungary and Bohemia in 1437, and in the following year was elected emperor by the name of Albert II. of Germany. He died in 1439, in a village of Hungary, while defending that country against Amurath II., sultan of the Ottomans. His posthumous son Ladislaus succeeded to the titles of duke of Austria and king of Hungary and Bohemia, under the guardianship of his cousin Frederick, duke of Styria. The Hungarians however would not acknowledge the infant Ladislaus, and offered the crown to another Ladislaus, king of Poland, who was shortly after killed at the battle of Varna against the Turks in 1444. The Hungarians then chose as their regent John Hunniades, under a nominal allegiance to Ladislaus the Posthumous. The Bohemians refused to acknowledge Ladislaus and chose Podiebrad as their leader. In 1451 however Ladislaus was acknowledged king of Bohemia, Podiebrad submitted to him, and was confirmed in his authority. Ladislaus was but a nominal king, and he died at Prague in 1458, leaving his cousin Frederick of Styria, who had been elected emperor by the name of Frederick III., heir to his numerous titles. The reign of Frederick, which lasted more than half a century, was inglorious to himself and disastrous to his subjects. [FREDERICK III. OF GERMANY.] Matthias Corvinus, the son of Hunniades, seized upon the crown of Hungary, and Podiebrad upon that of Bohemia, and after their death both crowns were united on the head of Ladislaus, son of Casimir, king of Poland. Of his hereditary states of Austria Frederick was obliged to resign a part to his own brother Albert. Frederick however was successful in marrying his son Maximilian to Mary, daughter of Charles the Rash, and heires to the vast dominions of the ducal house of Burgundy, by which means Franche Comté, Alsace, the Netherlands, Artois, in short all her father's territories, with the exception of Burgundy Proper, which was annexed to France, were united to the estates of the House of Austria. It was on the occasion of this marriage, in 1477, that Frederick bestowed on his son Maximilian the title of Archduke of Austria, which his successors have borne ever since. Frederick died in 1493, and Maximilian succeeded him in the Austrian dominions as well as on the Imperial throne, having been elected king of the Romans in his father's lifetime. Indeed from this time down to the dissolution of the German empire in our own days the Imperial dignity may be said to have become hereditary in the House of Austria. The reign of Maximilian was an important one both to Germany and to the Austrian dominions. He consolidated both the power of his house and that of the empire. He was the reformer of the public law of Germany, and the creator of German military discipline, being the first to establish a standing army, with infantry, cavalry, and artillery, divided into regiments and subdivided into companies. He secured the reversion of Hungary and Bohemia to his posterity by a double marriage of the archduchess Maria, his grand-daughter, with Ludovic, son of Ladislaus, and of Anna, sister of Ludovic, with his grandson Ferdinand. His own son Philip was married to Joanna, heiress of Castile and of Aragon. Maximilian died in 1519, and was succeeded on the Imperial throne by his grandson Charles V., who, in 1521, renounced the hereditary dominions of Austria to his younger brother Ferdinand, who afterwards, by the death of his brother-in-law Ludovic, king of Hungary and Bohemia, who fell in 1526 in the battle of Mohacs against the Turks, was acknowledged king of Bohemia. The Hungarians however, refusing to acknowledge Ferdinand's claims, raised to the throne John Zapolli, palatine of Transylvania, and after his death his son John Sigismund. This led to a long war, in which the Turks took a part, and which lasted the whole life of Ferdinand. By the abdication of his brother Charles V., Ferdinand was raised to the Imperial throne, with the sanction of the Imperial Diet, in 1558

[FERDINAND I. OF AUSTRIA.] From this time the House of Austria was divided into two great branches, the successors of Charles V., or the Spanish branch, and those of Ferdinand, or the German branch. Ferdinand I. died in 1564, leaving his eldest son, Maximilian, as archduke of Austria, and his other son, Charles, as duke of Styria, Carinthia, and Carniola. Maximilian succeeded his father as emperor, and died in 1576, after an able and wise reign. He concluded a convention with John Sigismund, who resigned to him the crown of Hungary, retaining the title of Prince of Transylvania. In Bohemia, Maximilian was acknowledged without difficulty, and his government was praised by both Roman Catholics and Protestants for its tolerance, moderation, and respect for their local privileges and usages. He was succeeded by his son Rudolf, styled Rudolf II, emperor of Germany. For the first time since the Habsburg family came into possession of the Austrian territories, Rudolf, as Maximilian's eldest son, obtained the sole possession of his paternal dominions, while his brothers, instead of having a joint-share in the government, were provided with annual pensions. This change, whether arranged during the reign of Maximilian II., or effected by a family compact between his heirs, established the right of primogeniture in the House of Austria, which has remained ever since. (Coxe, 'History of the House of Austria.')

Rudolf II. was very different from his father; he was bigoted and intolerant, and he alienated the Protestants of his dominions by forbidding the public exercise of their worship. The result was insurrection, followed by repression and persecution. The same course pursued in several of the German states led the Protestants to form a confederation, and to ally themselves with the United Provinces of Holland and with Henry IV. of France. Henry was assassinated in May 1610, just as he was ready to pour his troops across the frontier, and Rudolf himself died in 1612, leaving no issue. He was succeeded by his brother Matthias, who had already in his brother's lifetime seated himself on the thrones of Hungary and Bohemia, being assisted by the Protestants, whom he favoured. After a short interregnum Matthias was elected emperor. He died in 1619, also without issue, leaving his cousin Ferdinand, son of Charles, duke of Styria, and grandson of Ferdinand I., to succeed him. But before Matthias's death Bohemia was again in open insurrection, owing to the intolerant conduct of the archbishop of Prague, who had demolished several chapels of the Dissidents. This was the origin of the famous Thirty Years' War, which shook Europe to its very extremities. The events which followed are noticed in the article FERDINAND II. OF GERMANY. [GUSTAVUS ADOLPHUS.] Ferdinand II. died in 1637, and was succeeded by his son Ferdinand III., who, being wiser and more moderate than his father, put an end to the war, in 1648, by the treaty of Münster and Osnaburg, called also the treaty of Westphalia. Ferdinand died in 1657, and was succeeded by his son Leopold, who was already king of Bohemia and Hungary. Leopold, styled I. of Germany, a man of very inferior abilities, had a long and troubled reign, continually harassed by the unprincipled ambition of Louis XIV., who, aided by some alliances which his money enabled him to procure among the German electors, became the scourge of Germany. Louis, in order to annoy Leopold still more, prevailed on the Turks to advance to the very walls of Vienna, when at last a sense of the general danger roused Holland, England, Denmark, and even Sweden, against the common disturber of Europe. The victories of Eugene and Marlborough saved the empire on the side of the Rhine, as Sobieski had saved Austria on the Turkish side. Thus Leopold was enabled to weather the storm. He died in 1705, leaving his son Joseph to succeed him, while his other son, Charles, was fighting in the peninsula for the crowns of Spain and the Indies. Joseph I. reigned only a few years, but his reign was glorious; his armies and those of his allies completely turned the fortune of war against Louis XIV. He died in 1711, and was succeeded by his brother Charles, who put an end to the war of the Spanish succession by renouncing his claims to the crowns of Spain and the Indies in favour of Philip of Bourbon. The sequel of Charles's reign is given in the article CHARLES VI. OF GERMANY.

One great object of Charles's policy was to secure his hereditary dominions to his own daughter Maria Theresa, in preference to the daughters of his elder brother Joseph, both brothers having no male offspring. For this purpose Charles issued in 1713 the Pragmatic Sanction, an ordinance which established the right of succession in his own daughter, and he obliged his own nieces to confirm it by renouncing their pretensions on their respective marriages with the Electors of Bavaria and Saxony. He also obtained from the various states or provincial assemblies of his dominions the acknowledgment of the Pragmatic Sanction, and he induced most of the German and other European powers, with the exception of the Bourbons, to guarantee this family compact. Charles VI. died in 1740, and in him the male line of the House of Habsburg and Austria became extinct. His daughter Maria Theresa, who had married Francis of Lorraine, grand-duke of Tuscany, succeeded, after an arduous struggle, in securing the possession of the Austrian dominions. [FRANCIS I. OF GERMANY.]

When Maria Theresa, who had survived her husband, died in 1780, her eldest son Joseph, who had already succeeded his father as emperor of Germany in 1765, took into his hands the administration of the Austrian dominions. [JOSEPH II. OF GERMANY.] Joseph died in 1790, without issue, and was succeeded by his younger brother

Leopold, grand-duke of Tuscany, whose wise reign was but short. He died in 1792, leaving his youthful son Francis to stand the brunt of the political storms which had gathered over Europe in consequence of the French Revolution. A sketch of the long and eventful reign that followed is given under FRANCIS II. OF GERMANY.

Francis in 1806 resigned the title of emperor of Germany, and assumed that of Francis I., emperor of Austria. He died in 1835, leaving the crown to his eldest son, Ferdinand II. of Austria, born in 1793. Ferdinand was compelled to abdicate, December 2, 1848, and was succeeded by his nephew Francis-Joseph. [FRANCIS-JOSEPH.]

Leopold II. left a numerous family besides Francis. His second son, the Archduke Charles, born in 1771, became well known in the wars with France as general-in-chief of the Austrian armies. The next, the Archduke Joseph, born in 1776, became palatine and governor-general of Hungary. The Archduke John, born in 1782, became known as general in the Austrian armies. The Archduke Renier, born in 1783, was made, after the peace, viceroy of the Lombardo-Venetian kingdom. Of the sisters of Leopold, the eldest, Marie Antoinette, married Louis XVI. of France; the next, Maria Carolina, married Ferdinand, king of the Two Sicilies; and another married the Duke of Parma. A younger brother of Leopold, the Archduke Ferdinand, married Maria Beatrice, heiress of the house of Este, by whom he had Francis Joseph, the late, and father of the present Duke of Modena.

HACHETTE, JEAN NICOLAS PIERRE, was born at Mezières, May 6, 1769. He began his studies at Mezières, where Monge then held a professorship. At the age of twenty-three he was the competitor in the *concours* for a professorship of hydrography at Collioure. Some memoirs on mathematical subjects which he addressed to Monge, then minister of marine, procured him to be called to Paris, from whence he was sent to fill a professorship at Mezières, and at the end of 1794 was appointed to the Ecole Polytechnique, at its establishment. In this post he continued till the accession of Louis XVIII., by whose feeble and fanatical government he was, in 1816, deprived of his professorship, at the same time that Monge was expelled from the Institute. The government above-mentioned refused to sanction his admission to the Academy of Sciences; nor was it till after the Revolution of 1830 that the fellow-labourer of Monge, the instructor of Poisson, Fresnel, Arago, and of more than two thousand of the best qualified public officers in France, was permitted to sit among his former pupils at the Palais de l'Institut. M. Hachette died in January 1834, at the time when the cholera was raging in Paris, though not of that disorder. Independently of his public services, he obtained the respect of the whole community for his private worth; and the writer of this article, who enjoyed his acquaintance and correspondence during the last years of his life, can bear testimony to the openness, simplicity, and benevolence of his character, which, though not very common to such an extent among his countrymen, are, of all other qualities, those which most assist and least require their well-known address and manners.

The greater part of the life of M. Hachette was devoted to the development of the descriptive geometry of Monge, and its application in the arts of life, particularly in the description and construction of machinery. The attention which was paid to this subject from the opening of the Polytechnic School was one main cause of the improvement which took place in France as to all matters connected with construction. There is no question that since the Revolution of 1789 that country has made very rapid progress in all that relates to the arts which depend upon geometry. The genius of Monge and the foresight of those who founded the Polytechnic School were the primary causes of this improvement: M. Hachette was the most distinguished among those whose efforts filled up the details, disseminated the knowledge of the whole, and kept alive the impulse which the new state of things had given. Monge left the details of the descriptive geometry for the most part to Hachette, who made the first special application, and particularly to the construction of machinery. His works on descriptive geometry (that of Monge being comparatively elementary) and on machinery are still in high repute.

The works of M. Hachette are:—'Programmes d'un Cours de Physique,' 1809; an extension of a work previously written by Monge and Hachette in 1805. 'Correspondence sur l'Ecole Polytechnique,' 1803-15, a work edited by M. Hachette, and containing many memoirs by himself, some of great interest. 'Epreuves, or Collection of Drawings exemplifying the processes of Descriptive Geometry,' 1817. 'Eléments de Géométrie à trois dimensions,' 1817, in two parts, geometrical and algebraical. This work is remarkable as containing various theorems, demonstrated geometrically, which had not been previously obtained without algebra. 'First and Second Supplements to the Descriptive Geometry of Monge,' 1812 and 1818. 'Traité Élémentaire des Machines,' first edition about 1820, and three others since published. M. Hachette had previously, in 1808, taken a share in the work of MM. Lanz and Bétancour, 'Sur la Composition des Machines.' 'Géométrie Descriptive,' 1822. Various memoirs in the 'Annales d'Agriculture,' 'Société Royale, &c., d'Agriculture,' 'Société d'Encouragement,' &c.; 'Journal de l'Ecole Polytechnique,' &c., &c.

HACKERT, PHILIPP, a celebrated German landscape-painter, was born at Prenzlau in Prussia in 1737. His father was a portrait-painter and a native of Berlin, where Hackert spent some time with an uncle

who was a decorative painter. He acquired his chief knowledge of painting however by copying good pictures; and he derived great benefit also from the acquaintance of Le Sueur, the director of the Berlin Academy, and of Sauter. In 1765 he visited Paris, and in 1768 he went with his brother Johann to Italy. They spent some time in Rome sketching and painting the scenery about Albano and Tivoli: many of their works were purchased by Lord Exeter. Philipp's first works of importance however were the six large pictures of the Russian naval victory of Tcherna, and the burning of the Turkish fleet, by Count Orlov in 1770, painted for the Empress Catherine of Russia. Count Orlov, to whom the works were sent at Leghorn, was upon the whole highly gratified by their successful accomplishment, but he was dissatisfied with the representation of the explosion of a ship in the picture of the burning of the fleet; and in order to give the artist a proper impression of such a catastrophe, he ordered, with a spirit worthy of an autocrat, one of the frigates of his fleet, an old vessel, to be blown up in the presence of Hackett in the roads of Leghorn. He was well satisfied with the results of his experiment, for Hackett greatly improved the picture. These works, with six other similar subjects, are now at St. Petersburg. In 1772, the year in which the first-mentioned pictures were completed, Johann Hackett died at Bath, aged only twenty-nine: he came to England with some pictures which had been ordered by English travellers in Rome. In the meanwhile two other brothers, Wilhelm and Karl, joined Philipp in Rome; but Wilhelm went shortly afterwards to St. Petersburg, and died there in 1789, aged only thirty-two; and Karl settled in Switzerland. Philipp accordingly in 1778 sent for his youngest brother Georg, who was an engraver at Berlin, and they lived together from that time until the death of Georg at Florence in 1805.

Hackett was highly patronised in Rome both by Italians and foreigners; Pius VI. was delighted with his works, and his reputation as a landscape-painter was unrivalled by any of his contemporaries, though he was a very inferior painter to Wilson, who was neither appreciated nor known at that time: Wilson left Rome in 1755. In 1777 Hackett made a tour in Sicily with Richard Payne Knight and Charles Gore, and in 1778 a tour in the north of Italy with Charles Gore and his family. In 1782 he went to Naples, and was presented to the king, Ferdinand IV., by the Russian ambassador, Count Rasumowsky. The king took pleasure in the works of Hackett, and treated him with great kindness and familiarity; he used to style him Don Filippo. In 1786, after the departure of Count Rasumowsky, he appointed Hackett his principal painter, who settled with his brother from that time in Naples. They had apartments in the Palazzo Francavilla on the Chiaja, which they occupied until they were dispossessed by General Rey, the French commandant of Naples in 1799, who took possession of them himself; he however treated the Hacketts with great kindness, gave them passports, and suffered them to depart with all their property, with which they arrived safely at Leghorn. Hackett's salary was 100 ducats per month, with his apartments free both in Naples and at Caserta. In 1787 Hackett painted a large picture of the 'Launch of the Parthenope,' 64, the first ship of war which was built at Castellamare; it was engraved by his brother Georg; he painted five other large pictures of Neapolitan sea-ports, which were all enlivened by some historical scene of interest: they are in the palace at Caserta. In 1788 the king sent him to Apulia to make drawings of all the sea-ports of that coast, which he painted, from Manfredonia to Taranto. In 1790 he visited on a similar mission the coasts of Calabria and Sicily: the king equipped for him a small felucca called a scappavia, manned with twelve men well armed, for the express purpose: he was out about five months from April to August inclusive.

Hackett lived, after his departure from Naples in 1799, a short time in Leghorn, whence he removed to Florence, where he resided in a villa which he purchased in 1803 until his death in April 1807.

Hackett's works are not remarkable for any particular quality of art: they are simple portraits or prospects in ordinary light and shade, and their beauty accordingly depends upon the local beauty of the scene. The detail is careful without being minute, and where a memento of any particular scene is the chief object of desire, his works are calculated to give perhaps complete satisfaction, except in the case of some fastidious connoisseur who might require a bolder and more artistic foreground than those which characterise his works generally. His drawings are extremely numerous, and his paintings are not rare: many of them have been engraved. He painted in oil, in encaustic, and in body water-colours or à guazzo, a species of distemper. He also etched several plates.

Göthe has written an eulogistic life of Hackett, whose close imitation of nature delighted the German critic, and he has extolled him beyond his merits.

(Göthe, *Werke—Philipp Hackett*; and *Winckelmann und sein Jahrhundert*.)

HACKET, JOHN, was born in the year 1592, and educated at Westminster School, whence he was elected to Trinity College, Cambridge, at the age of sixteen. In 1618 he took orders, and soon after became chaplain to the Bishop of Lincoln. On the breaking out of the civil war he was appointed one of a sub-committee whose office it was to prepare a report on ecclesiastical reform for a commission empowered by the House of Lords. To this scheme however a stop

was put by the prevalence of the troubles and the opposition made by the bishops. During the civil war he espoused the cause of Charles, and his house was a kind of rallying point for his party. His zeal however led him into difficulties, and he suffered a short imprisonment; but after the restoration he accepted the bishopric of Lichfield and Coventry, where he died in 1670.

To Bishop Hackett we are chiefly indebted for the restoration of Lichfield cathedral. It had been cannonaded and subjected to all sorts of insult and pillage at the hands of the Puritan party; however, during the eight years that he held the bishopric, he contrived, partly at his own expense and partly by subscription, to put it into complete repair.

HADLEY, JOHN, the reputed inventor of the sextant which bears his name, became a Fellow of the Royal Society in 1717, and died February 15th 1744. He was author of several useful papers, which appear in the 'Transactions' of the Society, from vol. 32 to vol. 39. He was also upon intimate terms with Sir Isaac Newton, from whom it is supposed he borrowed, without acknowledgment, the idea of the sextant. It is now generally believed that Newton and Godfrey were the original and independent inventors of that instrument. [GODFREY.] Halley gave an account of the instrument in the 'Philosophical Transactions' for 1731; but Newton, previous to his death in 1727, had given a description of the instrument to Dr. Halley, by whom it was, for some unknown reason, suppressed, though it was communicated to the Royal Society in the year 1742, after Halley's death, by his executor, Mr. Jones. (Hutton, *Dictionary*, 1815; Herschel, *Astronomy*, p. 102; and *Trans. of the American Society*, vol. i., p. 21, Appendix.)

HADRIANUS, ÆLIUS, son of Ælius Hadrianus Afer, a cousin of Trajan, and a native of Hatria Picena, but of Spanish descent, and of Domitia Paulina of Cadiz, was born at Rome, in January A.D. 76. He was left an orphan at ten years of age, under the guardianship of Trajan and of Tatianus, a Roman knight. He made great progress in literature, especially in the study of Greek. In the reign of Domitian he served as commander of an auxiliary legion in Mæsia. Trajan gave him his niece Sabina in marriage, and he accompanied the emperor in his Dacian and Eastern campaigns. When Trajan died at Selinus in Cilicia, in August 117, Hadrianus, whom he had left in charge of the army in Syria, was proclaimed emperor by the soldiers at Antioch, and he wrote to the senate, requesting their confirmation. Plautina, Trajan's widow, favoured his views by pretending that Trajan on his death-bed had appointed him his successor, and for this service Hadrianus showed his gratitude to Plautina to the end of her life. The fact of Hadrianus being adopted by Trajan a year before his death has been asserted by some writers and denied by others. His election being confirmed by the senate, Hadrianus, after withdrawing the troops from the countries east of the Euphrates and making peace with the Parthians and the Armenians, set off for Rome, where he assumed the consulship in the following year (118) with T. Fuscus Salinator. He refused to appropriate to himself the triumph which had been destined for Trajan, and he caused the image of the deceased emperor to be carried in the triumph: according to Spartianus he himself carried it. He remitted all the arrears due to the public treasury by individuals in Rome and the rest of Italy, and all that was due from the provinces for sixteen years past; and he burnt in the Forum of Trajan the schedules of the debts, which are said to have amounted to several millions sterling. Medals were struck on this occasion with the figure of Hadrianus holding a torch and setting fire to the heap, and the legend "He enriches the whole world." In the following year Hadrianus was consul again with Rusticus; and hearing that the Sarmatians and the Roxolani had made an irruption into Illyricum, he repaired to Mæsia, defeated the invaders, obliged them to recross the Danube, and to sue for peace. He appointed Marcus Turbo governor of Pannonia and Dacia. From his camp in the Illyricum he wrote to the senate, accusing of high treason four senators of consular families, who were ordered for immediate execution. Other persons were arrested and put to death as accomplices in the alleged conspiracy, and a general alarm spread at Rome, when Hadrianus hurried back and affected to blame the precipitancy of the senate. He compelled Tatianus, his former guardian, whom he had made præfect of the Prætorian soldiers, and who had abused his power, and had advised the proscriptions, to resign his office. The year after, Titus Aurelius Fulvius, afterwards the emperor Antoninus Pius, was made consul; and in the same year Hadrianus began his travels through the various parts of the empire, which may be said to have occupied, with few interruptions, the remainder of his reign, a period of about eighteen years. We have memorials of his travels in numerous medals, struck in the various provinces on the occasion of his visit, which form an interesting series: an Italian medallist, Mezzabarba Birago, has put these medals in order and illustrated them. Hadrianus began with Campania, where he distributed sums of money to the poor of the various towns which he visited. Indeed liberality in this respect was one of the most conspicuous qualities of this emperor. He next went to Gaul, where he visited all the principal towns and fortresses; thence he proceeded to Germany, where the best legions of the empire were stationed, and he remained a considerable time among them for the purpose of restoring the discipline, which had become relaxed. He himself set the example by living as a soldier among the soldiers. Hadrianus was not fond of pomp or

show, and he went about with as little state as possible. He drew up a series of military constitutions or laws, which remained long in use after his time, and are quoted by Vegetius. He attached to every cohort a certain number of builders, masons, and other workmen.

In the following year, in the consulship of Annius Verus, grandfather of Marcus Aurelius, he left Germany, and returned to Gaul, whence he passed into Britain, where he is said by Spartianus to have reformed many abuses. Although Hadrianus did not live on very good terms with his wife Sabina, he punished those who presumed to fail in respect to the empress; among others, Suetonius Tranquillus, the biographer, who was Hadrianus's epistolographer, or secretary, whom he dismissed, as well as Clarus, the præfect of the Prætorium. While in Britain he constructed a rampart of earth, extending from the Solway Frith to the German Ocean, near the mouth of the Tyne, a little to the south of the more substantial wall afterwards raised by Severus. On his return to Gaul, Hadrianus built a magnificent palace at Nîmes for Plautina, Trajan's widow. He thence proceeded into Spain, and spent some time at Tarraco (Tarragona), where he held a general assembly of the deputies of the various provinces of Spain, and settled several disputes and complaints. While walking in the palace garden at Tarraco a slave attempted to kill him. The emperor parried the blow, and consigned the assassin to his guards, but on hearing that the man was insane he ordered him to be taken care of by his physicians. Hadrianus returned to Rome in the consulship of Aulus Aviola and Cornelius Pansa in 122; but he left it again soon after, and the next year we find him at Athens, a city to which he was much attached. He ordered the embankment of the Cephissus, which had damaged the town of Eleusis, and the construction and reparation of various edifices; thence he went to Syria, and had a conference with the King of the Parthians, when peace was confirmed between the two empires. In the year following he visited various parts of Asia Minor, and after building temples and other edifices at Nicomedia, Cyzicum, Nicæa, and other towns, he sailed to the islands of the Ægean Sea, and returned to spend the winter at Athens, where he was initiated into the Eleusinian mysteries, presided at the public games, and showed many marks of favour to the Athenians. He next went to Sicily, and ascended to the summit of Ætna to see the sun rise. He returned to Rome under the consulship of Verus and Junius Bibulus in 126, and we know nothing of his movements for the two following years. He appears to have been at Rome in the year 129, under the consulship of Juventius Celsus and Julius Balbus, when a violent earthquake having destroyed the towns of Nicomedia and Nicæa in Bithynia, and others, he ordered them to be rebuilt at his own expense, for which he is styled on some medals the Restorer of Bithynia. In the same year he set off for Africa, where he distinguished himself, as he had done on his previous travels, by his munificence. Plautina having died meantime, Hadrianus returned to Rome, and celebrated her funeral with great ceremony, and had her numbered among the gods. In the following year, 130, he raised a magnificent temple in honour of Venus and Rome, some remains of which are still seen near the arch of Titus. The plan of the building was made by Roman architects, and sent by the emperor to Apollodorus, a celebrated Grecian architect, for his opinion. Apollodorus observed that the building appeared too low for the size of the statues of Venus and Rome, which were intended to be placed therein, and which it would appear were represented seated, as Apollodorus remarked that those divinities, when once within, could not stand upright or walk out of the temple, if they should take a fancy to do so. Hadrianus, stung at this sarcasm, sent Apollodorus into exile; and it is added by some writers that he afterwards ordered him to be put to death on some frivolous pretence. In that year Hadrianus set off again for the east. He visited Cappadocia, where he held a conference with several kings or chiefs of the Caucasian tribes, the Abaxi, Zidretes, &c., whom he sent back loaded with presents. Even the Bactrians sent an embassy to propose an alliance with Rome. He next proceeded to Syria, Palestine, and Egypt, in which last country he remained two years. While he was in Egypt, and under the consulship of Lænas Pontianus and Antonius Rufinus, in 131, the jurist Salvius Julianus completed by his order the Perpetual Edict, which may be considered as the first general code of Roman law published by authority.

There is a letter of Hadrianus, written from Alexandria, to Servianus, his brother-in-law, in which he describes the state of the population of Egypt, and speaks of the various sects, Jews, Christians, Samaritans, &c., who were very numerous in that country; he says that they all adored but one god, namely, their own interest. He also notices as an extraordinary thing, that at Alexandria everybody, even the blind, followed some trade or occupation; a circumstance which probably struck him by contrast with the habitual idleness of the people of Rome. He restored the palace and museum of Alexandria, and held disputations with the learned men there. About this time his favourite Antinous died; some say he drowned himself in the Nile, and Hadrianus disgraced himself by the apotheosis and other absurd honours which he paid to his memory. He next went to Cyrenaica, where he is said to have killed a large lion. Hadrianus was an expert sportsman, and is said to have killed many wild beasts in his travels. Under the consulship of Hiberus and Sisenna, in 133, Hadrianus repaired to Syria, whence he set off for Thrace and Macedonia, and lastly stopped at Athens.

The insurrection of the Jews of Palestine under Barcochebas raged about this time. They took Jerusalem, and spread all over Syria, and Hadrianus was obliged to send for his best general, Julius Severus, who was in Britain, to assume the direction of the war against them, which lasted about three years. [BARCOCHEBAS.] Hadrianus raised a new city on the ruins of Jerusalem, which he called Ælia Capitolina, and he peopled it with a Roman colony, forbidding by an edict all Jews from setting their feet within it. The Christians, who were still confounded with the Jews by the Romans, were included in the prohibition. Hadrianus meantime made another long residence at Athens, and in the festivals of Bacchus he appeared in the dress of an arohon, and distributed money and corn to the people. He greatly embellished that city, a district of which was called by the name of Hadrianopolis. He also completed the temple of Jupiter Olympicus, which had been commenced a long time before. He returned to Rome under the consulship of Lupercus Pontianus and Rufus Aquilianus in 135, where he received the visit of Pharasmanes, king of Iberia, who came to answer several complaints laid against him by Vologesus, king of Armenia. An exchange of rich presents took place, and Hadrianus took care that his should exceed in value those brought to him by his visitor. Soon after, falling ill, he thought of choosing a successor, and he fixed his choice upon Lælius Aurelius Ceionius Commodus Verus, whom he adopted and appointed Cæsar by the name of Ælius Verus. In the following year Hadrianus retired to the neighbourhood of Tibur, where he built a magnificent villa, many remains of which are still existing, and which contained representations of the wonders of nature and of art which he had seen in his travels. Protracted illness seems to have soured his naturally suspicious temper, and he condemned several individuals to death, among others his brother-in-law Servianus, a man far advanced in age. Ælius Verus having died in the second year after his appointment as Cæsar, Hadrianus now fixed his choice upon Titus Aurelius Antoninus, on condition that he should adopt Lucius Verus, son of Ælius Verus. After some deliberation Antoninus accepted the proposal, and the double adoption was solemnised with the usual ceremonies in February, 137. Sabina, Hadrianus's consort, died about the time, and was numbered among the gods. Hadrianus still finding his illness increase, at last removed to Baia, where, in spite of the prescriptions of his physicians, he began to eat and drink according to his pleasure. Seeing his end approach, he composed some lines addressed to his soul, which show his doubts and fears concerning another existence. He died in July 138, in his sixty-third year, and the twenty-first of his reign. (Spartianus, *Life of Hadrianus*; Dion; Aurelius Victor; Eusebius.)

Coin of Hadrianus.

British Museum. Actual size. Copper. Weight 360 grains.

Reverses of Coins of Hadrianus.

In his personal character Hadrianus had valuable qualities, tarnished by some vices. As emperor, his reign may upon the whole be considered a happy one for the empire, which enjoyed almost uninterrupted peace. Less warlike than Trajan, he made himself respected by foreign nations without having occasion to resort to arms. His extensive travels form an important epoch in the history of Roman civilisation, which they must have tended to spread, while he corrected many abuses of provincial administration, and thus cemented the union between Rome and its vast dependencies. He used to say that an emperor ought to be like the sun, visiting by turns all the regions of the earth. He built numerous towns, embellished others, and peopled them with fresh colonies. Dion, who is in general not favourable to Hadrianus's character, admits that he never appropriated to himself other people's property, and that he would not receive anything left

him by will when the testator had children. Hadrianus gave no power to his liberti, and punished those about him who boasted of their influence for the purpose of extorting money. He was attentive to business, and an enemy to pomp and parade. If he cannot be counted one of the best emperors, he certainly must not be reckoned among the bad. He had an extraordinary memory; was a good orator, grammarian, poet, and musician; was acquainted with mathematics and medicine and delighted in the company of learned men; he was also a great friend to the arts of sculpture and architecture. He was the first emperor who let his beard grow—in order, it is said, to conceal some blemish in his face.

The busts, statues, and medals of Hadrianus are very numerous, and all bear a striking resemblance to each other in the character of the countenance. There is a full-length statue of him and two busts in the Townley Gallery, British Museum.

HĀFIZ MOHAMMED-SHEMS-EDDĪN, a celebrated Persian poet, was born at Shiraz, at the beginning of the 14th century of the Christian era. From his earliest years he received a lettered education; and paid great attention to the study of religion and Mussulman jurisprudence. He afterwards cultivated poetry, and became so celebrated that the Sultan of Baghdad invited him to his court. Hāfiz however appears to have remained in his native town the greater part of his life. His Persian biographers relate an interview he had with the celebrated Timur (Tamerlain), who conquered Shiraz in 1387. The date of his death is uncertain; it is placed by Daulat Shāh, in 1389. A splendid monument was erected over his grave, which is described by Kämpfer ('Amoenitates Exoticae,' p. 301); and Franklin ('Observations on a Tour from Bengal to Persia,' pp. 90-97) gives us an account of another monument erected to his memory in more modern times.

The poems of Hāfiz, like those of Anacreon, celebrate the pleasures of love and wine. They have always been greatly admired in Persia; though many Mohammedans have condemned them for their irreligious and licentious tendency. The admirers of Hāfiz, on the other hand, contend that his poems are not to be understood in a literal, but in a figurative or allegorical sense; and that they express in emblematical language the love of the creature to the Creator. The sect of the Sūfis, who interpret the poems of Hāfiz in this manner, possess many similar poems. They maintain that by wine he meant devotion, by perfume the hope of divine favour, and some have gone so far as to compose a dictionary of words in the language of the Sūfis (see Sir W. Jones, 'On the Mystical Poetry of the Persians and Hindus,' 'Asiatic Researches,' v. 3). But we are not sure that any of the poems of Hāfiz ought to be interpreted in this manner. Sir W. Jones, who was a great advocate for such a mode of interpretation, remarks, in the essay referred to above, "It has been made a question whether the poems of Hāfiz must be taken in a literal or figurative sense; but the question does not admit of a general and direct answer; for even the most enthusiastic of his commentators allow that some of them are to be taken literally, and his editors ought to have distinguished them, instead of mixing the profane with the divine, by a childish arrangement according to the alphabetical order of the rhymes" (p. 172-3). We are aware that many Europeans justify the allegorical mode of interpreting the poems of Hāfiz, by a reference to Solomon's Song and the Sanscrit poem 'Gita Govinda' by Jayadvā. It is however very doubtful whether these poems ought to be interpreted in an allegorical manner. The poems of Hāfiz have had a great number of Sūfi commentators, such as Shuri, Seid Ali, Lamei, Sururi, and Shemei; but the most celebrated are the Turkish commentators Feridun and Sudi.

The poems of Hāfiz were arranged after his death, by Seid Kāsem Anvāri, and were entitled the 'Divān.' The 'Divān' contains, according to the best manuscripts, 571 odes, called ghazels. They were published in the original Persian, at Calcutta, 1 vol. fol., 1791; this edition contains only 557 ghazels, and 7 cassidehs, or elegies. Rewuski published a few of the odes with a Latin translation and the commentary of Sudi, under the title of 'Specimen Poesos Asiaticæ, sive Haphysi Ghazelle, sive ode sexdecim,' Vienna, 1771. Several of the odes are inserted in Sir W. Jones's 'Commentarii Poesos Asiaticæ;' Wahl's 'Neu Arabische Anthologie,' 8vo, Leip., 1791; Ousley's 'Persian Miscellanies,' 4to, Lond., 1791; 'Asiatic Miscellany,' 2 vols. Calc., 1785-86. The whole 'Divān' was translated into German by Von Hammer, Tübing., 1812; and several of the odes have been translated into English by Richardson, 'Specimen of Persian Poetry, or the odes of Hāfiz, with an English translation and paraphrase,' chiefly from the 'Specimen Poesos Asiaticæ of Baron Rewuski,' Lond., 1774; Nott, 'Select Odes of Hāfiz translated into English verse,' 4to., Lond., 1787; Hindley, 'Persian Lyrics, or scattered poems from the Diwān-i-Hāfiz,' 4to, Lond., 1800.

(Further particulars concerning the life and writings of Hāfiz are given in the life prefixed to the Calcutta edition of his poems; in the biography of Daulat Shāh, in Wilken's 'Chrestomathia Persica,' Leip., 1805; and in the 4th vol. of the *Notices et Extraits des MSS. de la Bibliothèque du Roi*; in the article 'Hāfiz,' in the *Biographie Universelle*, by Langles; and the same article in Ersch and Gruber's *Encyclopædie*, by Kosegarten.

HAGGAI, one of the twelve minor Hebrew prophets. We know nothing concerning the place or time of his birth. The pseudo-

Epiphanius, in his 'Lives of the Prophets,' states that he was born at Babylon; and according to the Rabbis he was a member of the Great Synagogue. The date of Haggai's prophecy is fixed by himself (i. 1), and by Ezra (v. 1), in the second year of the reign of Darius Hystaspis (a.c. 519). We learn from Ezra that the Jews, who returned to their native country in the first year of the reign of Cyrus, commenced rebuilding the Temple, but were interrupted in their undertaking by the neighbouring satraps, till the second year of the reign of Darius Hystaspis, when the building was again continued in consequence of the exhortations of Haggai and Zechariah.

The prophecy of Haggai may be divided into four parts: in the first, the prophet urges the people to continue building the temple, by the promise that God would bless them in their undertaking, and that their previous neglect had been the cause of the drought and bad seasons which they had experienced (i.); in the second, he encourages them by the promise that this second temple should surpass the first in glory; this prophecy is supposed by many to have been fulfilled by Christ entering the temple (ii. 1-9); in the third, he promises the people an abundant harvest, since they had begun to build the temple (ii. 10-19); and in the fourth, he foretells the prosperity of Zerubbabel, governor of Judah (ii. 20-23). Zerubbabel is considered by many commentators to be a type of the Messiah; and the prophecy is supposed to relate to the glory of the Messiah's kingdom.

The canonical authority of this book has never been disputed. It is quoted by the author of the Epistle to the Hebrews, xii. 26; compare Hag. ii. 7, 8, 22.

The prophecy of Haggai is written in a prosaic style, and bears traces of having been composed in a late period of Hebrew literature. It possesses none of that vigour and sublimity which distinguish the works of most of the Hebrew prophets who lived before the Babylonian captivity.

The Septuagint, Vulgate, and Syriac versions of the Old Testament attribute the 111th, 126th, 127th, 146th, 147th, and 148th Psalms to Haggai and Zechariah.

* HAGHE, LOUIS, was born in 1802, in Belgium; and in that country he acquired the principles of art, but at an early age he came over to England and established himself in London as a lithographer. His drawings on stone soon acquired a high reputation, and in connection with Mr. Day, under the firm of Day and Haghe, he did much to show the commercial as well as the artistic capabilities of the new art. Some of the most important and costly works which have been produced in lithography, at least in this country, have been executed by and under the superintendence of Mr. Haghe. Of these, the first in rank, and most finished in style is Roberts's 'Sketches in the Holy Land, Syria, Idumea, Arabia, Egypt, and Nubia,' in four large folio volumes, a work carried on throughout with unflinching brilliancy and undeviating excellence, and far surpassing in splendour and finish the corresponding work by De Laborde, which may be taken as the representative of French lithographic art. Mr. Haghe's lithographs from his own drawings of old Flemish interiors form another magnificent work, and one the more honourable to him, he being the original draftsman, as well as the lithographer. For Mr. Haghe is at least equally skilful with the brush as with the chalk. Indeed in depth and force of light, shade, and colour, vigour and facility of drawing, and general boldness of execution, few among living water-colour painters in his special line of art equal him. Of late years Mr. Haghe has more and more devoted himself to painting, and since the dissolution of partnership between himself and Mr. Day, it has been as a water-colour painter that his name has almost exclusively appeared before the public. He is a leading member of the New Society of Painters in Water-Colours, and in the annual exhibitions of that society, his admirable representations of the antique interiors of Flemish town-halls, churches, guard-rooms, &c.,—with which are usually associated the quaint military and civil costumes, and often some historical or romantic incident of the 16th or 17th century,—are always a principal attraction. One of these pictures, 'The Hall of Courtray,' is in the Vernon Gallery. It deserves to be mentioned that, remarkable as Mr. Haghe's drawings and paintings are for their fullness and correctness of detail, as well as for their general effect, they are all, of necessity, executed with the left hand.

HAHNEMANN, SAMUEL, founder of the system of medicine called Homœopathy, was born at Meissen, in Upper Saxony, on the 10th of April 1755. His father, Gottfried Hahnemann, who was an artist of considerable merit, was employed in the painting of china in the celebrated porcelain manufactory of Meissen. He was a clever well-educated man, and to him his son owed the first rudiments of his education. He was afterwards placed at an elementary school, the director of which, Dr. Müller, remarking talents that only required cultivation to raise the boy to eminence, persuaded his father to place him at the High School of Meissen, into which they obtained him a free admission. Hahnemann gladly availed himself of these increased facilities; he made himself master of Latin, Greek, and Hebrew, and evinced a decided bias for the study of the physical sciences, natural history, and medicine. Botany was also a favourite pursuit, and his hours of leisure were devoted to the collection of plants and their systematic arrangement. His intense application and amiable disposition won the goodwill of the head master and teachers, who vied with

each other in affording him every facility in the prosecution of his studies; and his progress was so rapid, that in a short time he was appointed an assistant teacher.

Having chosen medicine for his profession, at the commencement of 1775 he left the High School of Meissen, and, assisted by the friendship of his former teachers, he entered the University of Leipzig, having, as a candidate, written a Latin thesis on the construction of the human hand.

Being wholly dependent upon his own exertions for subsistence, he supported himself during his residence at Leipzig by giving lessons in German to foreign students and by the translation of English and French medical authors. The professors of the university, in admiration of his zeal for knowledge and great acquirements, invited him to attend their lectures gratuitously. Having passed two years in the study of the theory of medicine, and saved a small sum of money, he departed for Vienna, there being no clinical lecturer in the University of Leipzig, and entered himself at the Hospital of Charitable Brothers, with a view to the completion of his studies and to acquiring a practical knowledge of his profession.

His moderate pecuniary resources were almost exhausted, when his talents and marked attention to his duties gained for him a firm friend in Dr. Quarin, physician to the emperor of Austria and chief physician to the hospital, through whose recommendation, although he had not yet graduated, Hahnemann obtained the situation of family medical attendant and librarian to Baron von Brückenthal, governor of Siebenbürgen, then residing at Hermannstadt. He remained here for two years, and being allowed to attend private practice saved a small sum of money; with this he removed to Erlangen, where, on the 10th of August 1779, he took his degree of M.D. and produced his thesis 'Conspectus Affectuum Spasmodicorum Etiologicus et Therapeuticus.'

In the year 1781 he was appointed district physician at Gomers, near Magdeburg, where he married the daughter of an apothecary named Köhler. Previous to this he had resided some time at Hettstadt and Dessau, diligently pursuing, in addition to his professional labours, the studies of chemistry and mineralogy.

In the year 1784 he removed to Dresden, where he gained a high reputation in the hospitals as a judicious and skilful practitioner, but, struck with the absence of a guiding principle in therapeutics, and the great uncertainty of the healing art, he gradually withdrew himself as much as possible from practice, and endeavoured to support his family by his old resource of translations of English and French medical authors, pursuing at the same time his favourite study of chemistry.

During this period he published his pamphlets on Mercurius Solubilis; on the mode of detecting Adulteration in Wine; on Calcarea Sulphurata; and on the Detection of Arsenic in cases of Poisoning; he also contributed many papers to Crell's 'Chemical Annals,' and gave to the world a number of minor medical works, which have since been collected by Dr. Stapf and published under the title of 'Kleine Schriften,' Dresden and Leipzig, 1829.

In 1790, while engaged upon the translation of the 'Materia Medica' of Cullen, he was struck with the different explanations given of the mode of operation of Peruvian bark in intermittent fever; and dissatisfied with them, he determined to try its effects upon himself. Finding that powerful doses of this substance produced symptoms strikingly analogous to those of that form of intermittent fever for which it was an acknowledged specific, he determined to try further experiments with other medicinal substances upon himself and upon some medical friends. He obtained similar results: that is, he produced by these agents factitious or medicinal disorders resembling the diseases of which they were esteemed curative; and thus, the first dawn of the law of 'Similia Similibus' gleamed upon him. In a work ascribed to Hippocrates (Ed. Basil. ap. Froben., 1538, p. 72) a similar doctrine was enunciated, and the same doctrine has since found advocates in many eminent medical writers; but Hahnemann was the first who assumed it to be the guiding principle in Therapeutics, and supported his position by a series of experiments. Confident that he had discovered the long-sought-for law, he assiduously pursued his proving of medicines, and adopted the new principle in the treatment of his patients with (according to his own testimony and that of his disciples) a success fully commensurate with the limited means then at his disposal. Thus encouraged, he ventured in 1796 to address a paper to Hufeland's 'Journal,' in which he announced his new discovery to the medical world, pointed out the defects of the 'Materia Medica' as then constituted, and the necessity of its reconstruction upon the basis of pure experiment; at the same time he earnestly invited the co-operation of his medical brethren. The attention of the German physicians was then deeply engaged in the investigation of the Brunonian theory, and Hahnemann's suggestions were coldly received.

In 1801 he published a short treatise on the efficacy of Belladonna in the prevention and cure of scarlet fever, and affirmed that its curative properties were based upon the homœopathic law. In 1805 he published the results of a number of experiments in a work in two volumes, entitled 'Fragmenta de Viribus Medicamentorum positivis sive obviis in Corpore Sano,' and in the same year his 'Medicine of Experience,' in which he still more strongly expresses his objection to the old system of medicine. In 1810 he brought out his great work, the

'Organon of the Healing Art,' in which he developed his new system of treating disease; and for the first time gave it the name of 'Homœopathy,' by which it has since been distinguished. In 1811 the first part of the 'Materia Medica Pura' was published, six volumes of which appeared in succession till it was completed in the year 1821, since which time several other editions have been published.

In the year 1812 he returned to Leipzig, where he was appointed Magister Legens. To prove his qualifications for this chair, he wrote an excellent treatise on the hellebore of the ancients, 'Dissertatio historico-medica de Helleborismo Veterum.' At Leipzig he had an extensive practice, and was assisted by a great number of friends and pupils in the proving of his medicines. The apothecaries of that city however rose against him, and appealing to an old law long dormant, that forbade a physician to dispense his own prescriptions, they eventually, after some litigation, succeeded in 1820 in obtaining a decision in their favour. Hahnemann, unwilling to risk his own reputation and that of his system upon medicines prepared and dispensed by individuals avowedly hostile to his medical tenets, had determined to retire from practice, when the Duke of Anhalt Cöthen offered him an asylum in his dominions, with the enjoyment of those privileges of which he had been deprived at Leipzig. It was during his sojourn at Cöthen, in the year 1828, that he published in four volumes his work on 'Chronic Diseases, their Peculiar Nature, and Homœopathic Cure.' In 1829 the disciples and admirers of Hahnemann caused a bronze medal to be struck to mark their attachment to the new system and their esteem for its founder. It bore on the face the head of Hahnemann, with the inscription, 'Samuel Hahnemann natus Misene d.x Aprilis MDCCCLY. Doctor creat. Erlangæ d.x Augusti MDCCCLXXIX.' On the reverse, in the centre, 'Similia Similibus;' the inscription, 'Medicinæ Homœopathiæ Auctori, Discipulis, et Amici, d.x Augusti MDCCCLXXIX.' His adherents had at this period greatly increased, and he enjoyed a very extensive practice among his own countrymen and foreigners.

Having been a widower for some years, he married in 1835 a French lady, Melanie de Herville, who had visited Cöthen for the benefit of his advice, and at her desire he removed to Paris. In commemoration of his arrival in the French capital, an admirably-executed medal by David was struck in bronze, silver, and gold, bearing on its face the head of Hahnemann. He remained at Paris in the active exercise of his profession, and surrounded by numerous followers of his system of all nations, till the time of his decease, which took place on the 2nd of July 1843, in the eighty-ninth year of his age.

HAILES, LORD. [DALRYMPLE.]

HAKLUYT, RICHARD, was born in 1553. Having studied at Christ Church, Oxford, and applied himself particularly to the study of geography, or cosmography, as it was then called, he was made a lecturer on that subject at Oxford. In order to promote the study of his favourite science he published narratives of several voyages and travels, both English and foreign, which he afterwards brought together in his great collection. About 1584 he went to Paris with Sir Edward Stafford, ambassador of Queen Elizabeth to the French court, where he remained five years. On his return to England he was made by Sir Walter Raleigh a member of the company of gentlemen adventurers and merchants of London, for the inhabiting and planting "of our people in Virginia," as appears from his 'Collection of Travels,' edition of 1589, p. 815, which he published in one vol. fol., and which he afterwards enlarged and published in 3 vols. fol., 1599-1600, under the title, 'The Principal Navigations and Discoveries of the English Nation, by Sea or over Land, to the remote and farthest distant quarters of the Earth, at any time within the compass of these 1500 years.' The first volume embraces the discoveries by the English in the north and north-east by sea, towards Lapland, the Straits of Waigatz, Nova Zembla, and towards the mouth of the river Oby, and also travels through the empire of Russia, Georgia, Armenia, Bactria, Tartary, &c. The second volume contains accounts of the discoveries of the English by sea and land in the southern and south-eastern parts of the globe; and the third, their discoveries in the new world of America. Hakluyt has inserted many curious documents, such as letters of various sovereigns; charters and privileges granted by the Czars of Russia, the Sultan, and others, to English merchants; tables of weights, coins, and distances of different countries, &c. Most of the voyages and discoveries contained in this collection were effected in the 16th century, although a few are of a prior date. A new and improved edition, in 5 vols. 4to, was published in London 1809-12. Hakluyt published also or edited translations of several foreign narratives of travellers, of which a selection has since been made: 'A Selection of curious, rare, and early voyages and histories of interesting discoveries, chiefly published by Hakluyt, or at his suggestion, but not included in his celebrated compilation,' 4to, London, 1812. It contains among others La Brocquière's 'French Narrative of a Visit to Palestine,' in 1442-43; the 'Travels of Louis Vertomanus of Rome to Arabia, Persia, and the East Indies in 1502;' and 'Virginia richly valued by the description of the mainland of Florida, her next neighbour,' from the Spanish of Fernando de Soto. Hakluyt died in 1616 and was buried in Westminster Abbey.

HALDE, DU, born at Paris in 1674, entered the society of the Jesuits, and being distinguished for his information and labouriousness, he was entrusted by his superiors with the care of collecting and

arranging the numerous letters written by the missionaries of the society from various parts of the world. This employment furnished him with materials for the collection styled 'Lettres Edifiantes et Curieuses,' which he edited, and which contain much interesting and valuable matter. He also compiled from the reports of the Jesuit missionaries and their translations of Chinese works, a full and well digested description of that empire, which was the first published in Europe: 'Description Historique, Géographique et Physique, de l'Empire de la Chine et de la Tartarie Chinoise,' 4 vols. fol., with an atlas, Paris, 1735, reprinted soon after at the Hague, in 4 vols. 4to, and translated into English by R. Brookes, 4 vols. 8vo, London, 1736. Du Halde made a conscientious use of the best materials which he could get at the time from his brethren of the Chinese missions, and his authorities must answer for the charge brought by some against his work, that it is too favourable to the Chinese and their social system, and that he is too credulous as to the accounts of the Chinese concerning the prodigious amount of their population, the size of their towns, &c. A clever, though sarcastical and somewhat desultory notice of Du Halde's work appeared in England not long after its publication, under the title, 'An Irregular Dissertation occasioned by reading Father Du Halde's Description of China,' London, 1740.

Du Halde was at one time secretary to Father le Tellier, confessor of Louis XIV. He died at Paris in 1743.

HALE, SIR MATTHEW, was born on the 1st of November 1609, at Alderley, in the county of Gloucester. His father had been educated for the bar, but he abandoned the practice of the law because he could not understand the reason of giving colour in pleading, which as he thought was to tell a lie. Both his parents having died while he was yet an infant, Matthew Hale was educated, under the directions of a near relation on his mother's side, by a clergyman professing Puritanical principles. At the age of seventeen he was removed to Magdalen Hall, Oxford, where he speedily got rid of his Puritanical notions, and plunged into dissipation with a looseness proportioned to his former austerity. At this period he was upon the point of becoming a soldier in the army of the Prince of Orange, then engaged in the Low Countries. Accidental circumstances however introduced him to the notice of Serjeant Glanvil, who, perceiving the valuable qualities which the young man possessed, persuaded him to apply himself to the study of the law. Acting under this advice, he was admitted a student of Lincoln's Inn on the 8th of November 1629, and immediately commenced a course of arduous study. One of his companions in a debauch having been taken suddenly and dangerously ill, Hale was so struck with remorse that he gave up his intemperate habits. After having studied with great diligence the laws of England and the civil law, and also several other branches of learning, he was called to the bar some time previous to the commencement of the civil war. He resolved not to take any part in the political dissensions and contests which then agitated the country, and he steadily kept his resolution. This part of his conduct is mentioned by some of his biographers with commendation, whereas in reality it arose from a weakness in his character which showed itself on several subsequent occasions. Indeed he seems to have been aware at a later period of his life that it is not the part of a good citizen during times of political agitation, when the liberties of his country are at stake, to prefer his own individual ease and quiet to the general good. His neutrality was highly favourable to his interest as an advocate; he was engaged as counsel for the court party in a number of the most important state trials, and was notwithstanding held in such esteem by the parliamentary party that he was constituted counsel to the commissioners deputed by parliament to treat with the royal commissioners as to the reduction of Oxford.

After the execution of Charles I., Hale took the engagement to be true and faithful to the commonwealth, and accepted the appointment of one of the commissioners for reforming the law. In 1653, after having shown some hesitation as to accepting the dignity, he was made one of the judges of the Common Bench; resolving, after discussing his doubts with lawyers and divines, "that as it was absolutely necessary to have justice and property kept up at all times, it was no sin to accept a commission from usurpers." To this his biographer Burnet goes on to add, "if he made no declaration acknowledging their authority, which he never did." This addition has given rise to much of the odium which has attached to Hale's memory in consequence of this apparent insincerity; but credit can hardly be given to the statement, for it is impossible to suppose that Hale, who was unquestionably an honest and sincere man, though perhaps weak in matters of conscience, could have been guilty of the pitiful and shallow attempt to evade the evident conclusion, that acting as a judge under his commission was the most effectual and formal declaration he could make of his submission to Cromwell's authority. Some colour however is given to Burnet's imputation by Hale's subsequent conduct. After having discharged the duties of his office with consummate skill and strict impartiality, he suddenly, and without any apparent cause, affected to feel scruples of conscience at acting as judge in criminal cases, and refused to preside in the crown courts, though he still continued to administer the law in civil cases. This conduct was directly contrary to his reason for accepting the office of judge, and appears to be founded on no just view. On the death of Cromwell, Hale refused to act under a commission from

the protector Richard, alleging that he could no longer sit under such authority. He was a member of the parliament which recalled Charles II., and was made chief baron of the exchequer in 1660, and knighted. In 1671 he was raised to the chief-justiceship of the King's Bench, where he presided with honour to himself and advantage to the public till 1675, when from the state of his health he resigned his office. He suffered considerably from repeated attacks of asthma, and died from dropsy on Christmas-day 1676.

As a lawyer Hale's reputation is high, and his integrity is unimpeached; indeed his punctilious feelings were carried to a fantastical excess, as many anecdotes related by his different biographers show.

The only spot upon his memory as a criminal judge is the notorious fact of his having condemned two wretched women for witchcraft, at the assizes at Bury St. Edmunds, in the year 1665. Hale in the course of the trial avowed himself a believer in witchcraft, and the jury found the prisoners guilty, notwithstanding many impartial bystanders declared that they disbelieved the charge. No reprieve was granted, and the prisoners were executed. An anecdote is mentioned by his biographers of his having hastened the execution of a soldier found guilty of murder, for fear he should be reprieved; but in so doing he certainly overstepped the bounds of his duty as a judge.

Sir Mathew Hale was a voluminous writer, though none of his productions were printed during his life. His 'Pleas of the Crown,' 'History of the Common Law,' and some other treatises connected with the law, have been published since his death, and also several others upon scientific and religious subjects. His manuscripts, which he had collected at a very considerable expense, he bequeathed to the Society of Lincoln's Inn, and he directed that they should not be lent out or printed, saying, "As they are a treasure not fit for every man's view, nor is every man capable of making use of them, I would have nothing of these books printed;" and he also directed that any of his posterity, members of that society, might, on giving security, have one book at a time lent out to them by the society.

A catalogue of the manuscripts was contained in his will, and a full account and catalogue of all his works is printed in Dr. Williams's 'Life of Hale.' His life has also been written by Burnet and Roscoe, and many anecdotes relating to him are detailed by that amusing gossip Roger North, in his 'Life of Lord-Keeper Guildford,' though it should be observed that the author does not write in a very friendly spirit towards Hale.

Sir Mathew Hale was twice married: first to Ann, daughter of Sir Henry Moore, by whom he had ten children; and secondly, late in life, to one of his own domestic servants.

HALES, STEPHEN, D.D., was born at Beckesbourn, in Kent, September 7, 1677, entered of Benet College, Cambridge, in 1696, was elected Fellow in 1702; and having taken holy orders, was presented about 1710 to the perpetual curacy of Teddington, near Twickenham, where, though he obtained other church preferment, he resided to the end of his life. He was elected F.R.S. in 1717, and in 1753 was admitted a foreign associate of the Académie des Sciences in place of Sir Hans Sloane. He died in 1761.

During his residence at Cambridge he applied himself diligently to physical researches, which continued to be his favourite pursuit through life. His first important publication was 'Vegetable Statics, or an Account of some Statical Experiments on the Sap in Vegetables, &c. &c. &c.' and he has the honour of having made the first essays towards the modern discoveries in vegetable physiology. This work, which is still referred to for excellent evidence concerning many facts in vegetable physiology, obtained for him a foreign reputation, being translated into French, Italian, Dutch, and German. 'Hæmastatics,' a similar treatise on the circulation of the blood, followed in 1733. Dr. Hales's genius was of a very practical turn: most of his numerous inventions and writings refer to some direct application of science to daily use. They comprehend anatomical and surgical treatises, analyses of medicines, experiments on the preservation of provisions during long voyages, the distillation of salt water, and the like; with several sermons. Of all these labours the most brilliantly successful was his plan of ventilating prisons, the holds of ships, and other close and unhealthy places. Having bestowed great pains on this object, he procured, in 1749, the erection of one of his machines in the Savoy prison; and the benefit obtained is stated by Mr. Collinson to have been so great, "that though 50 or 100 in a year often died of the gaol distemper before, yet from 1749 to 1752 inclusive no more than four persons died, though in 1750 the number of prisoners was 240." By the introduction of his system into the old jail of Newgate the mortality was reduced in the proportion of seven to sixteen. In France it was extensively adopted with similar beneficial result in prisons, hospitals, ships of war, the preservation of corn in granaries, &c. Numerous papers of Dr. Hales are printed in the 'Phil. Trans.' A list of his works will be found in Watt's 'Bibl. Britann.'

(Memoir, by Peter Collinson, in the 'Ann. Reg.,' 1764.)

HALFORD, SIR HENRY, was born on the 2nd of October 1766, and was the son of Dr. James Vaughan, physician to the Infirmary at Leicester, and author of 'Observations on Hydrophobia, on the Caserean Section, and on the Effects of Cantarides in Paralytic Affections.' He received his early education at Rugby, and was afterwards admitted at Christ Church, Oxford; he graduated in medicine

at Oxford in 1794, and was elected a Fellow of the College of Physicians in the same year. Having been well introduced into London society, and being distinguished for the elegance of his manners, and having early married a daughter of Lord St. John, it was not long before his practice became considerable. He was appointed by George III. one of his physicians, and in 1809 he became possessed of a large fortune by the death of his mother's cousin, Sir Charles Halford, and changed his name from Vaughan to Halford. He was made a baronet in the same year. Sir Henry continued to hold the office of physician to George III. till the king's death, and subsequently held the same appointment under George IV., William IV., and Victoria. He was appointed president of the College of Physicians in 1824, and delivered the oration on the occasion of that body removing from their old building in the city to the new one in Pall Mall.

During his professional career, Sir Henry was too much occupied with the kind of practice to which his early connections in life introduced him, to contribute much valuable information to the literature of his profession. His publications consist of essays and orations. The Orations were delivered before the college, and are written in Latin, and exhibit a purity of style beyond the average of such productions at the present day. His Essays are as follows:—1, 'On the Climacteric Disease;' 2, 'On the Necessity of Caution in the Estimation of Symptoms in the last Stages of some Diseases;' 3, 'On the Tic Douloureux;' 4, 'On Shakspeare's Test of Insanity;' 5, 'On the Influence of some Diseases of the Body on the Mind;' 6, 'On the *Kavros* of Aretæus;' 7, 'On the Treatment of Gout;' 8, 'On Phlegmasia Dolens;' 9, 'On the Treatment of Insanity;' 10, 'On the Death of some Illustrious Persons of Antiquity;' 11, 'On the Education of a Physician;' 12, 'On the Effects of Cold.' These essays and papers display the elegant scholar and observant physician, and are mostly written in an easy graceful style, but they are marked by no depth or originality of thought. In 1813 Sir Henry Halford descended with the Prince-Regent into the royal vaults of St. George's Chapel, Windsor, where amongst other curiosities they discovered the head of Charles I. Of this visit and discovery Sir Henry has given an account, which is deposited in the British Museum, and is authenticated by the signature of the Prince-Regent. He died on the 9th of March 1844. He had been for more than twenty years president of the College of Physicians, and was mainly instrumental in establishing the evening meetings of that body. His urbanity of manners, and devotion to the interests of the college, have left a grateful recollection amongst the members of that corporation.

(Petigrew, *Portraits and Memoirs of Medical Men; Transactions of Medical and Surgical Association*, vol. i.)

* HALIBURTON, THOMAS CHANDLER, is a native of the British colony of Nova Scotia, where he practised as an advocate, and since 1842 has been a judge. Speaking of himself in 1853, he states that he had resided there more than half a century. In 1829 he published at Halifax 'An Historical and Statistical Account of Nova Scotia,' 2 vols. 8vo. A series of communications to one of the journals of Halifax, under the pseudonym of Samuel Slick, having attracted much attention, he collected and published them in 1837, with alterations and additions, under the title of 'The Clockmaker, or Sayings and Doings of Samuel Slick, of Slickville;' the success of the work was such as to induce him to continue it, and he produced in 1838 and 1840 two additional volumes. In Samuel Slick he exhibits the peculiarities of character and dialect of the travelling tradesman of the New England States, speculating, cunning, self-conceited, and audacious, practising all kinds of inventive shifts, and sagaciously observant of everything which passes before and around him. The minute accuracy of description, the practical good sense combined with sly humour and droll comparisons, all conveyed in the Yankee dialect, rendered the work extremely popular in England as well as in America. A visit which Mr. Haliburton afterwards paid to this country afforded him an opportunity of combining his own observations and remarks as a Nova Scotian with those of the imaginary American clockmaker; and that high life in England might be described as well as the life of the lower grades of society, the author attached Sam Slick to the American embassy in London, and published in 1843 'The Attaché, or Sam Slick in England,' by the author of the Clockmaker,' 2 vols., to which he afterwards added a second series in 2 vols. 'The Old Judge, or Life in a Colony,' 2 vols. 8vo, 1849, removes the scene to Nova Scotia, and exhibits the manners, customs, and dialectic peculiarities of that colony with the same racy humour as before. Judge Haliburton's next work was of a different kind, and much less satisfactory: 'The English in America,' 2 vols. 8vo, 1851, is an account of the first settlers in the New England States, especially Massachusetts; and is rather a violent political dissertation, abusive of the democratic and puritanical principles of the settlers, than an impartial narrative of the progress of the settlements. The 'Traits of American Humour,' 3 vols. 8vo, 1852, consist of a collection of fugitive productions of various writers, some known, but mostly unknown, which appeared in 1829 and subsequent years in the journals of Baltimore, New York, and elsewhere. In 'Sam Slick's Wise Saws and Modern Instances, or what he said, did, or invented,' 2 vols. 8vo, 1853, and in 'Nature and Human Nature,' 2 vols. 8vo, 1855, we have the same shrewd observation, peculiar humour, and Yankee dialect, as in the preceding works; but the most amusing things long continued are apt

to induce a sense of weariness and a wish for change. In none of these series of humorous narratives is there any attempt at the construction of a regular tale. There are indeed occurrences, characters, sketches, dialogues, always spirited, and mostly humorous; but there is a want of that interest which is excited by a story formed with dramatic skill.

HALIFAX, GEORGE MONTAGU, EARL OF, was the fourth son of George Montagu, Esq., of Horton in Northamptonshire, who was the fifth son (the eldest by his third wife) of Henry, first earl of Manchester. He was born at Horton, on the 16th of April 1661. His education was begun in the country, but he was eventually sent to Westminster School, where he was chosen a king's scholar in 1677, and whence in 1682 he was removed to Trinity College, Cambridge. He had distinguished himself, while a pupil of Busby's at Westminster, by his extemporaneous epigrams; and the same liveliness of talent showed itself in a way to attract wider attention in an effusion of English verse which he produced on the death of Charles II., in February 1635, beginning (not at all in jest or satire)—

Farewell, great Charles, monarch of blest renown,
The best good man that ever filled a throne;

and proceeding in the same strain till at last the poet exclaims—

In Charles, so good a man and king, we see
A double image of the Deity.

This performance, we are told, so charmed the Earl of Dorset that he induced the young poet to come up to town, where he was introduced by his lordship to all the wits of his acquaintance. In 1687 he and Prior brought out in conjunction their burlesque upon Dryden's 'Hind and Panther,' entitled 'The Hind and the Panther transversed to the Story of the Country Mouse and the City Mouse.' It is for the greater part a dialogue in prose, apparently in imitation of Buckingham's 'Rehearsal,' with the parody in verse of portions of Dryden's poem interspersed. The best parts of it are said to be Prior's, as may be very well believed; it is not however printed in the common collections of his poetry, but it is preserved in the 'Supplement to the Works of the Minor Poets,' 1750, vol. i. pp. 47-82, under the head of 'Additions to the Works of the Earl of Halifax.'

Montagu appears to have some time before this entered upon his career as a politician. Johnson, in his 'Lives of the Poets,' merely says that "he signed the invitation to the Prince of Orange, and sat in the convention;" but his signing the invitation to the prince would seem to imply that he had occupied some public post, and he is therefore, we suppose, the Charles Montagu who is set down as one of the members for the city of Durham in James II.'s parliament which assembled on the 19th of May 1685. In the convention parliament he sat for Malden; and he was returned for the same place to the next parliament, which met in March 1690. It is stated to have been about the time of the revolution that he married the Countess Dowager of Manchester; she was Anne, widow of Robert, third earl of Manchester, and daughter of Sir Christopher Yelverton, Bart.

According to Johnson, it was his intention when he formed this connection to take orders; but afterwards altering his purpose he purchased for 1500*l.* the place of one of the clerks of the council. He was also fortunate in his next poetical performance, 'An Epistle to Charles, earl of Dorset, occasioned by his Majesty's Victory in Ireland,' being a celebration of the battle of the Boyne, for which King William, to whom he was introduced upon the occasion by Dorset, is said to have bestowed upon him a pension of 500*l.* A repartee of his Majesty's, who when Dorset presented the poet as a mouse is said to have replied that he would make a man of him, is upon good grounds discredited by Johnson. His 'Epistle on the Victory of the Boyne,' which extends to above 200 lines, is Montagu's greatest effort in verse.

The rest of his history is that of a political character, and only a patron of poets. Johnson relates a well-known anecdote of a speech he made in one of the debates on the Trials for Treason Bill, in 1691, in the midst of which he is said to have fallen into confusion, and then, when he recovered himself, to have ingeniously turned the circumstance into an argument for what he was urging—the allowance of counsel to the prisoner. There is no notice of this speech in the 'Parliamentary History.' He had already however raised himself by his speaking to great distinction; and on the 21st of March in this year he was taken into office as one of the lords of the Treasury. He became chancellor of the Exchequer on the 1st of November 1695, and to this office on the 1st of May 1697 he conjoined that of first lord of the Treasury. In 1695 and 1696 he obtained great credit by his management of the operation of the general recoinage of the silver money. It was in the latter of these years that, to supply a temporary circulating medium, he contrived what are called Exchequer Bills, the convenience of which species of paper, both for the government and the public, has kept it in use ever since. Many of Montagu's Exchequer bills however were for sums much lower than any for which such bills are now issued. After he became first lord of the Treasury he was appointed one of the lords justices on the king going abroad, both in July 1698, and again in May 1699. "In the House of Commons," says Burnet under the year 1698, "Mr. Montagu had gained such a visible ascendant over all that were zealous for the

king's service, that he gave the law to the rest, which he did always with great spirit, but sometimes with too assuming an air;" "which," subjoins Mr. Speaker Onslow, in a note, "did him infinite hurt, and lowered at last his credit very much in the House of Commons." Lord Hardwicke, in a note on the same passage, affirms, that for two sessions together Montagu did not exert himself in the House (for what reason Hardwicke does not know), but suffered Mr. Harley and his friends to take the lead, even while he continued in the king's service. He is also asserted to have lost some credit about this time, and to have been thought to have behaved meanly, by stating in the House, in one of the debates on the Irish grants, some information which had been communicated to him in confidence. On the modification of the ministry in November 1699, Montagu was removed to the auditorship of the Exchequer, and his places of first lord and chancellor were given, the former to Lord Tankerville, the latter to Mr. John Smith. In the end of the following year, on the acquisition of the complete ascendancy by the Tories, he was removed from the House of Commons by being created Baron Halifax (with remainder, failing his own issue male, to George Montagu, son and heir of his eldest brother, Edward Montagu). This, it seems, was insisted upon by Harley, the new manager of the House of Commons. The title of Marquis of Halifax had just become extinct by the death of the son of the first marquis (SAVILE, GEORGE); and, according to Lord Dartmouth, in a note on Burnet ('Own Times,' ii. 108), Montagu took his title in grateful remembrance, as he pretended, of the old marquis, who, Dartmouth says, had first brought him into business by recommending him to be a clerk of the council: "but," he adds, "generally thought more out of vanity (of which he had a sufficient share), in hopes of raising it to as high a degree as his benefactor had done."

Lord Halifax was impeached by the new House of Commons in April 1701, along with Lord Somers and the earls of Portland and Orford. The question was carried in the House by a vote of 186 against 163; but the impeachment was not prosecuted, and on the 24th of June the charges were dismissed by the Lords. (See the proceedings in the 5th volume of the 'Parliamentary History,' and in the 14th volume of Howell's 'State Trials.') The articles exhibited against Halifax were six in number—1, That he had directed a grant to the value of 13,000*l.* to pass to Thomas Railton, Esq., in trust for himself, out of the forfeited estates in Ireland; 2, That he had received to his own use 1000*l.* a year out of the said grant; 3, That, while chancellor of the Exchequer, he had obtained and accepted of several other beneficial grants to or in trust for himself; 4, That in 1697 he had procured a grant to Henry Segur, gentleman, in trust for himself, of wood from the Forest of Dean, to the value of 14,000*l.*; 5, That while he was chancellor of the Exchequer he had obtained for his brother Christopher the office of auditor, in trust, as to the profits thereof, for himself; 6, That he had advised his Majesty to enter into the two Partition treaties. In his answer Halifax maintained that the grants from the Irish estates and the Forest of Dean were legal, and were also not of the value charged; and there was nothing wrong in procuring the auditorship of the Exchequer for his brother, to be held by him till he should himself be ready to step into the office; and that, as to the Partition treaties, he was rather opposed to than in favour of them.

In 1703, after the accession of Queen Anne, Halifax was again attacked by the Commons on the charge of having been guilty of breach of trust in the management of the public accounts while he was chancellor of the Exchequer; and an address was voted to the queen requesting that she would be pleased to give directions to the attorney-general to prosecute him. But he was again protected by the Lords; and after some altercation between the two houses the matter was dropped. The proceedings are given in the 'Parliamentary History,' vi. 127, &c. Though out of office during this reign, he continued to take an active part in the debates of the House of Lords, especially distinguishing himself in 1707 in the defence of the union with Scotland. Lord Dartmouth however complains (note on Burnet, 'Own Times,' ii. 431) that he and Lord Wharton brought up a familiar style with them from the House of Commons, "that has," says his lordship, "been too much practised in the House of Lords ever since, where everything formerly was managed with great decency and good manners." To Halifax also belongs the credit of having first moved, and taken the most active part, in the project for the purchase of the Cotton manuscripts and the establishment of a public library, out of which eventually came the British Museum. (Burnet, 'Own Times,' ii. 440.)

Having always kept up a connection with the Hanoverian family, Lord Halifax was found, on the death of Queen Anne, to be one of the nineteen persons appointed by the new king to hold the government along with the seven great officers of state till his majesty should come over. On the 14th of October 1714 he was raised to the dignities of Earl of Halifax and Viscount Sunbury, and was restored at the same time to his former post of first lord of the Treasury, his office of auditor of the Exchequer being given to his nephew. But he died of an inflammation of the lungs on the 19th of May in the following year. He left no issue, so that his earldom and viscounty became extinct; but he was succeeded in his barony according to the limitation by his nephew George Montagu, who a few weeks after was made Earl of Halifax and Viscount Sunbury by a new creation. The son of the

second Earl of Halifax died without issue in 1772, when all the honours became extinct.

Halifax was one of the most consistent of the Whig party to whom we are indebted for the Revolution, the Hanoverian Succession, and the Union with Scotland. It is evident also, from the detail that has been given, that he was a person of great general ability. But his ability was marred by his excessive vanity and ambition: and Marlborough hardly spoke too strongly when he said, "I agree with you, Lord Halifax has no other principle but his ambition; so that he would put all in distraction rather than not gain his point." (Letter to the Duchess of Marlborough, February 7, 1709.) With regard to his literary standing, it is evident he was much more a man of action than of any remarkable powers of thought; and what he has written, whether in verse or prose, is of very little value. A list of his pieces is given by Walpole in his 'Royal and Noble Authors.' His character as a patron of literature has been drawn with some severe satiric touches, under the name of 'Full-Blown Bufo,' by Pope, in his 'Prologue to the Satire.'

HALL, BASIL, CAPTAIN, R.N., was born at Edinburgh in 1788. His father, Sir James Hall, Bart., of Dunglass, was President of the Royal Society of Edinburgh. He was the author of an 'Essay on the Origin, Principles, and History of Gothic Architecture,' published in 1813, and a frequent contributor of scientific papers, chiefly on geological subjects, to the Royal Society of Edinburgh. Sir James Hall was married to Helen, a daughter of the fourth Earl of Douglas.

Basil Hall entered the royal navy in 1802; in 1808 received his first commission as lieutenant; in 1814 was promoted to the rank of commander; and in 1817 he was made a post-captain. The opportunities which the naval profession affords both for scientific pursuits and the study of men and manners in various climes happened in Captain Hall's case to lead him into scenes of more than usual interest; or perhaps it would be more correct to state that his eager and indefatigable pursuit of knowledge induced him to seek every means of extending the sphere of his observations. In 1813, when acting commander of the *Theban* on the East India station, he accompanied Sir Samuel Hood, the admiral, in a journey over the greater part of the island of Java. Soon after his return to England he was appointed to the command of the *Lyra*, a small gun-brig, in which he accompanied the expedition which took out Lord Amherst as ambassador to China. While the ambassador was pursuing his journey inland to Peking, Captain Hall in the *Lyra* visited the places of greatest interest in the adjacent seas, and on his return to England in 1817 he published 'A Voyage of Discovery to the Western Coast of Corea, and the Great Loo Choo Island in the Japan Sea.' There is an appendix to the work, which contains charts and various hydrographical and scientific notices. A second edition was published in 1820, in which the scientific details are omitted; and in 1827 the work appeared in a still more popular form as the first volume of 'Constable's Miscellany.' In this edition there is an interesting account of Captain Hall's interview at St. Helena with the ex-emperor Napoleon. Sir James Hall (Captain Hall's father) had been the emperor's fellow-student at Brienne, and was the first native of Great Britain whom the emperor recollected to have seen. Captain Hall was next employed on the South American station in command of the *Conway*. The period was one of great interest to the Spanish colonies of South America.

Having returned to England early in 1823, Captain Hall published 'Extracts from a Journal written on the Coasts of Chili, Peru, and Mexico, in the years 1820, 1821, and 1822,' with an appendix containing a memoir on the Navigation of the South American station. There are also appendices which contain various scientific notices; and a paper by Captain Hall 'On the Duties of Naval Commanders-in-Chief on the South American Station before the appointment of Consuls.' In 1825 he married Margaret, youngest daughter of the late Sir John Hunter, Consul-general for Spain; and in April 1827 he and his wife and child sailed from Liverpool for the United States, where they remained above a year, during which Captain Hall travelled nearly nine thousand miles by land and water conveyances. In 1829 he published his 'Travels in North America,' 3 vols. 8vo. He next published 'Fragments of Voyages and Travels.' They form three series, each of three volumes, 12mo. In 1834 he met at Rome with a sister of Mrs. Dugald Stewart, who having married Count Purgstall, an Austrian nobleman, had resided many years at her schloss or castle of Heinfeld, near Gratz, in Styria. He accepted an invitation to visit the countess, and his book, 'Schloss Heinfeld, or a Winter in Lower Styria,' was the result of his notes during his residence there. Captain Hall supposes that *Die Vernon*, in Sir Walter Scott's novel of 'Rob Roy,' was sketched from Miss Cranstoun, which was the maiden name of the countess. Captain Hall's last work was published at the end of the year 1841, in three volumes, under the title of 'Patchwork.' It consists of detached papers, which embrace recollections of foreign travel, incidents worked into short tales, and a few essays.

Captain Hall was a Fellow of the Royal Societies of London and Edinburgh, and a member of the Astronomical Society of London. The following is a list of some of his scientific papers:—'An Account of the Geology of the Table Mountain; Details of Experiments made with an invariable Pendulum in South America and other places for determining the Figure of the Earth; Observations made on a Comet

at Valparaiso. The above three papers are published in the 'Transactions of the Royal Society.' A Sketch of the Professional and Scientific Objects which might be aimed at in a Voyage of Research. A Letter on the Trade Winds, in the Appendix to Daniel's 'Meteorology;' with scientific papers in Brewster's 'Journal,' Jameson's 'Journal,' and the 'Encyclopædia Britannica.'

Captain Basil Hall having been unfortunately seized with mental alienation, was placed in the Royal Hospital, Haslar, Portsmouth, where he died on the 11th of September 1844.

HALL, THE RIGHT HON. SIR BENJAMIN, M.P., is the son of the late Mr. Benjamin Hall, many years M.P. for Totnes, Westbury, and Glamorganshire, by a daughter of William Crawshaw, Esq., an extensive iron-master in South Wales. He was born in 1802, and received his early education at Westminster School and Christchurch, Oxford. He first entered upon public life in 1831, when he was returned to Parliament for Monmouthshire in opposition to the Marquis of Worcester, afterwards Duke of Beaufort, in whose family the representation of that county had been vested for several generations. Though unseated on petition, he was re-elected in December 1832, after the passing of the Reform Bill, and continued to represent that constituency until 1837, when he was elected for the metropolitan borough of Marylebone, for which he has continued to sit without interruption to the present time (September 1856). From the time of his first entry upon parliamentary life, he has devoted great attention to public business, and more especially to the state, prospects, and revenues of the Established Church, in which he has effected some judicious and well timed reforms by bringing abuses to light, and by subjecting the establishment and its dignitaries to the jurisdiction of the state, and the control of parliament, and of public opinion. He has also from year to year brought forward bills for the abolition of church-rates, which, though still in existence, may be said to be doomed to early abolition by his constant and persevering efforts. He has also steadily advocated the extension of the suffrage and of secular education, and of sanitary and social reforms, as well as the substitution of a property tax in place of the assessed and other taxes. In 1854 he was appointed president of the Board of Health, and was sworn a member of the Privy Council, and in this capacity he brought forward the Act by which all the local administration of the metropolis is brought under one system. In the following year he succeeded the late Sir William Molesworth, as chief commissioner of Public Works. He has also been a zealous supporter of the literature and social improvement of his Cambrian countrymen, as well as of the movement for providing the working classes with rational amusement on Sundays. He was advanced to a baronetcy for his public services in 1838 on the occasion of her Majesty's coronation.

HALL, or HALLE, EDWARD, an English lawyer and historian, was the son of John Halle of Northall in Shropshire, and was descended from Sir Francis Van Halle, K.G., in the time of Edward III., who was the son of Frederic de Halle of the Tyrol, natural son of Albert king of the Romans and archduke of Austria. He was born at the close of the 15th century, in the parish of St. Mildred, London, and received the first part of his education at Eton School. In 1514 he became scholar of King's College, Cambridge, and continued there till he became a junior fellow; afterwards, about 1518, when Cardinal Wolsey founded various lectures at Oxford, he removed to that university. Having entered at Gray's Inn, he was called to the bar, and became first one of the common serjeants, and subsequently under-sheriff of the city of London. In 1533 he was appointed summer-reader of Gray's Inn, and in 1540 double reader in Lent, and one of the judges of the Sheriff's Court. He died in 1547, and was buried in the church of St. Benet Sherehog, London.

Hall's Chronicle, entitled 'The Union of the two noble and illustrious Families of Lancaster and Yorke,' was first printed by Berthelette, in small folio, in 1542. This edition is extremely rare. It was dedicated to King Henry VIII., and ended with his twenty-fourth year, 1532. Grafton, who reprinted it in 1548, continued the work from Hall's papers to the end of Henry VIII.'s reign. He again printed it in 1550. 'The boke commonly called Halle's Cronycles' is one of those which were forbidden by proclamation, 13th June 1555, 1 & 2 Phil. and Mary. A fourth edition, but without any additions or improvements, was printed in 4to, London, 1809, by the booksellers, among the 'English Chronicles.'

HALL, JOSEPH, an eminent divine and prelate, was born July 1st, 1574, at Ashby-de-la-Zouch, in Leicestershire, and received his academical education at Emmanuel College, Cambridge, of which in due time he was elected fellow. Having taken orders and received some minor benefices in succession, he was made dean of Worcester in 1617; sent as one of the English deputies to the synod of Dort in 1618; appointed bishop of Exeter in 1627, and translated to Norwich in 1641. His professional seal and earnest piety involved him in those jealous times in the charge of puritanism; and being harassed by frequent and vexatious attacks, to use his own words: "Under how dark a cloud I was hereupon I was so sensible, that I plainly told the lord archbishop of Canterbury [Laud] that rather than I would be obnoxious to those slanderous tongues of his misinformers I would cast up my rochet. I knew I went right ways, and would not endure to live under undeserved suspicions." In truth he was well attached to the

church of which he was a member, and wrote strongly in defence of episcopacy when the danger of the times became imminent. In November 1641, having joined others of the bishops in a protest against all laws made during their forced absence from parliament, he was sent to the Tower, and only released in the following June on giving bail for 5000*l*. In the next year the revenues of his bishopric were sequestrated, and during the rest of his life he suffered much from poverty and harsh treatment, of which he has given an account in a piece called 'Hard Measure.' He removed in 1647 to Higham, near Norwich, and died there in 1656.

His numerous works fill several volumes in the old folio editions, and ten in the modern 8vo. They are chiefly controversial, as will appear from the catalogue in Watt, and therefore of ephemeral popularity. His 'Contemplations' are of more personal and lasting interest, and are esteemed for their language, criticism, and piety; as also his 'Enochismus, or Treatise on the Mode of Walking with God,' a beautiful tract, translated into English in 1769. To the student of English manners his Satires entitled 'Virgidemiarum,' in 6 books, are peculiarly valuable. They have been analysed by Warton, 'History of Poetry,' (iii. 405-40, ed. 1840). He says of them very truly, "The characters are delineated in strong and lively colouring, and their discriminations are touched with the masterly traces of genuine humour. The versification is equally energetic and elegant, and the fabric of the couplets approaches to the modern standard. It is no inconsiderable proof of a genius predominant over the general taste of an age when every preacher was a punster, to have written verses where laughter was to be raised, and the reader to be entertained with sallies of pleasantry, without quibbles and conceits. His chief fault is obscurity, arising from a remote phraseology, constrained combinations, unfamiliar allusions, elliptical apostrophes, and abruptness of expression."

HALL, REVEREND ROBERT, was born on the 2nd of May 1764, at Arnsby in Leicestershire, where his father, of the same name, had been settled since 1753 as pastor of a congregation of Particular Baptists. He had come from Northumberland, where his forefathers belonged to the class of yeomanry; and he is stated to have been a man, though not of much learning, of considerable native power of mind. He is the author of several short religious publications: one of which, entitled 'A Help to Zion's Travellers,' has been often printed, and is still read.

The subject of this notice was the youngest of fourteen children. It is related that he was two years old before he learned to speak: but after this, the progress he made in all branches of his education was very rapid. Though the circumstance is absurd, it is an evidence of the impression he had made by his precocity—that when he was only eleven years old, a fellow-clergyman of his father's (Mr. Beeby Wallis, of Kettering), to whom he had been taken on a visit, seriously set him to preach to a select auditory assembled in his house. His gift of ready expression had, it would appear, already strongly developed itself. He used to attribute much of his early intellectual excitement to the conversation of a metaphysical tailor in his native village, a member of his father's congregation.

He lost his mother in 1776, and it appears to have been after this that he was sent to board at a Baptist school in Northampton, kept by the Rev. Dr. John Ryland. Here he remained for a year and a half, after which he was placed, in October, 1778, at the Bristol Academy, with the view to his becoming a Baptist minister. It was the practice there, as it is in most Baptist theological seminaries, for the students to commence preaching before they have finished their education; and Hall was formally set apart as a preacher by his father's congregation in August, 1780. In the autumn of 1781 he was selected by the authorities of the Bristol Academy to be sent to King's College, Aberdeen, on Dr. Ward's exhibition; and there he studied for the usual period of four winter sessions; preaching, at least occasionally, in the intervening summers. It was at Aberdeen that Hall and Sir James Mackintosh, then also a student at King's College, became acquainted. They bore a close resemblance in intellectual character, in their powers of mind as well as in their tastes, and the intimacy which there sprung up between them led to an affectionate friendship, which lasted while they both lived.

Hall did not finally leave Aberdeen till May, 1785; but he had already, during the preceding summer, officiated as one of the regular pastors of the Baptist congregation at Broadmead, Bristol, in association with Dr. Caleb Evans; and in August, 1785, he was also appointed classical tutor in the Bristol Academy. His father died in 1791, and the same year a difference with Dr. Evans led to his removing from Bristol and accepting an invitation to become pastor of the Baptist congregation at Cambridge on the departure of the Rev. Robert Robinson, who had adopted Unitarian views, to be successor to Dr. Priestley at Birmingham.

Robert Hall had already acquired considerable celebrity as a preacher, but it was not till now that he appeared as an author; and the impulse that sent him to the press was rather political than theological. His first publication (unless we are to reckon some anonymous contributions to a Bristol newspaper in 1786-87) was a pamphlet entitled 'Christianity consistent with a Love of Freedom, being an Answer to a Sermon by the Rev. John Clayton,' 8vo, 1791. Like most of the ardent minds of that day, he had been strongly excited and carried

away by the hopes and promises of the French Revolution, and he appears to have retained his first faith without much alteration for some years. In 1793 he published another liberal pamphlet, entitled 'An Apology for the Freedom of the Press, and for general Liberty, with Remarks on Bishop Horsley's Sermon preached 31st January, 1793.' This was largely diffused, and brought him much reputation. The impression that had been made upon him however by the irreligious character of the French revolutionary movement was indicated in his next publication, 'Modern Infidelity considered with respect to its Influence on Society, a Sermon,' 8vo, 1800. It was the publication of this able and eloquent sermon which first brought Hall into general notice. From this time whatever he produced attracted immediate attention. The Sermon on Modern Infidelity was followed in 1802 by another on the Peace, which also brought him great reputation.

In November 1804 Hall was visited by an attack of insanity, the violence of which did not last long, but from which he did not entirely recover for some years. His state of health made it necessary for him to resign his charge at Cambridge; but, about 1807, he became minister of the Baptist chapel in Harvey-lane, Leicester, and this position he held for nearly twenty years. He married in March, 1808. At last, in 1826, he removed to the pastoral care of his old congregation at Broadmead, Bristol; and here he remained till his death, which took place at Bristol, on the 21st of February 1831.

Besides occasional contributions to various dissenting periodical publications, Hall published various tracts and sermons in the last twenty years of his life, which, along with those already mentioned, have since his death been collected and reprinted under the title of 'The Works of Robert Hall, A.M., with a brief Memoir of his Life by Dr. Gregory, and Observations on his Character as a Preacher by John Foster; published under the superintendence of Olinthus Gregory, LL.D., professor of mathematics in the Royal Military Academy,' 6 vols. 8vo, London, 1831-32. It was intended that the Life should have been written by Sir James Mackintosh, but he died (in May, 1832) before beginning it. Dr. Gregory's Memoir, from which we have abstracted the materials of this article, somewhat amplified was afterwards published in a separate form. [GREGORY, OLINTHUS.] The first volume of Hall's Works contains sermons, charges, and circular letters (or addresses in the name of the governing body of the Baptist church); the second, a tract entitled 'On Terms of Communion,' in two parts, 1815; and another entitled 'The Essential Difference between Christian Baptism and the Baptism of John' (a defence of what is called the practice of free communion, which produced a powerful effect in liberalising the practice of the Baptist community), in two parts, 1816 and 1818; the third, political and miscellaneous tracts, extending from 1791 to 1826, and also the Bristol newspaper contributions of 1786-87; the fourth, reviews and miscellaneous pieces; the fifth, notes of sermons, and letters. The sixth, besides Dr. Gregory's memoir, contains Mr. Foster's observations, and notes taken down by friends of twenty-one sermons.

Hall was a man of many virtues, and of intellectual powers which placed him in the first class of men of talent. His acquirements were very considerable, and he appears to have kept up the habits of a studious man to the end of his life. But the great temporary impression which he made as a preacher and as a writer is to be attributed more to general force and fervour of mind, than to any higher or rarer faculty. He was more of an orator or of a rhetorician than of a thinker. His greatness lay in expression and exposition, not in invention; and even his eloquence was rather flowing and decorative than imaginative or impassioned. His mind was scarcely in any sense an original or creative, nor even a subtle or a far-seeing one.

HALL, SAMUEL CARTER, editor of 'The Art-Journal,' is the third son of the late Lieut.-Col. Hall of Topsham, Devonshire, and was born in the year 1801. He entered the Inner Temple when very young, and was called to the bar immediately after his marriage with the lady who is the subject of the next notice. Mr. Hall however has preferred literature to the profession of the law, and has published many elaborately illustrated works, to which the chief artists and engravers of the day have given their aid. In early life Mr. Hall was connected with the public press as a parliamentary reporter. He succeeded the poet Campbell as editor of the 'New Monthly Magazine,' and during the period of his connection with that work, wrote "leaders" for several town and country journals. He then issued 'The Book of Gems,' and subsequently 'The Baronial Halls of England,' and 'The Book of British Ballads,' works which have deservedly obtained extensive circulation in England and America. Another work—the 'Ireland'—in three volumes, with numerous illustrations, was written by Mr. and Mrs. Hall, and contains a large amount of facts and legendary and antiquarian lore, the result of many visits to the country. Among his other literary and editorial labours, it may be mentioned, that Mr. Hall edited 'The Amulet' for eight years; but the work in connection with which his name will be best known is 'The Art-Journal,' a monthly publication, originally commenced in 1839 under the title of 'The Art-Union Monthly Journal,' and which has been several times enlarged, with the addition of elaborate steel engravings from works of the best painters and sculptors. Some of these illustrations have appeared contemporaneously in separate forms, as in the case of the 'Vernon Gallery' and 'The Royal Gallery of Art,' the latter work giving engravings from the pictures of

the royal collections. Mr. Hall is a fellow of the Society of Antiquaries, and is the author of several minor poems,—one of which, 'Lines on Jerpoint Abbey,' is referred to by Moore in his 'History of Ireland.'

HALL, MRS. S. C., authoress of the 'Sketches of Irish Character,' and many popular novels, was born in Dublin, and was christened Anna Maria Fielding. Losing her father at a very early age, she was left to the care of her mother, a lady of great beauty and accomplishments—descended from a Huguenot family, who had taken refuge in England from the persecutions following the revocation of the edict of Nantes—and by whom she was sedulously educated. Even whilst a child, Anna Maria Fielding wrote poems and plays. Her early days were spent at the residence of her maternal grandmother, whose second husband was a large landowner at Bannow. When little more than fourteen, Miss Fielding accompanied her mother to England. About this time her more active studies were pursued,—music being especially cultivated. Her public appearance as an authoress is attributed by herself to her union with Mr. S. C. Hall, which event took place when both were young, and through which she has been spared many of the trials usually incidental to a literary life. Her first work was produced at Mr. Hall's instance, who having urged her to write what he thought she told so well—a story of Bannow; the result was the 'Sketches of Irish Character,' a work which was at once favourably received, and gave the authoress a permanent position. The 'Tales of the Irish Peasantry' appeared afterwards. Both works have gone through several editions in England, and like her later works, have been widely circulated in America. Mrs. Hall's first three-volume novel was 'The Buccaneer,' wherein she defended the great chief of the English Commonwealth, before Carlyle had published the eulogium in his 'Hero-Worship.' She afterwards wrote 'Marian'; 'Uncle Horace'; 'The Outlaw'; and 'Lights and Shadows of Irish Life,'—each in three volumes, all being now well known from their appearance in a popular form. She has also contributed from time to time to 'The Art-Journal,' and amongst the number of her works which there or elsewhere have been published with illustrations, may be named the 'Pilgrimages to English Shrines,' and 'Midsummer Eve—a fairy tale of Love.' She also wrote the 'Tales of Woman's Trials.' The three last-named works have been translated into the German. Mrs. Hall has also published a number of books for children, one of which, 'Uncle Sam's Money Box,' is said to be greatly popular with the young, and whilst her husband was editing 'The Amulet,' she produced eight volumes of the 'Juvenile Forget-me-Not.' Mrs. Hall also has devoted her pen largely to the advancement of several social and charitable objects, amongst which may be referred to, the Temperance cause, the Governesses' Benevolent Institution, and the Hospital for the cure of Consumption. Amongst Mrs. Hall's matured efforts in dramatic literature may be named 'The French Refugee,' acted for about fifty nights at the St. James's Theatre, and 'The Groves of Blarney,' wherein Power played in three characters, in which he afterwards had himself represented in a picture. The work on 'Ireland,' by Mr. and Mrs. Hall, has been named in her husband's biography.

HALLAM, HENRY, English historian and critic, was born in or about the year 1778, and was educated at Eton, and at Christchurch College, Oxford, where he took the degree of M.A. In the early part of the present century he became a resident in London, where, since that time, he has passed the greater portion of his life in literary research and composition. He was one of the contributors to the 'Edinburgh Review' in the first years of its publication; and in the pages of that review, as well as of some other contemporary periodicals, he first gave conspicuous proofs of his erudition, his taste, and his calm philosophic judgment. One of his most celebrated articles in the 'Edinburgh Review' was that on Sir Walter Scott's biography of Dryden, and edition of Dryden's works, published in 1808. In the allusions made to Mr. Hallam at this period in the correspondence of such men as Wilberforce, Romilly, Horner, Jeffrey, there is ample proof of the high respect in which he was held by the literary circles of London and Edinburgh, on account of his scholarship. Byron's allusion also to "the classic Hallam," in his 'English Bards and Scotch Reviewers,' testifies satirically to the same fact. From the very first Mr. Hallam had attached himself to the Whig party in politics, but the candid and philosophic temper of his mind prevented him from mingling with ordinary political strife. He took a warm interest however in questions of general philanthropy, social improvement, and constitutional progress. He co-operated heartily in the movement for the abolition of the slave-trade. In the meantime, while thus making his name favourably known to all who were interested in literature, and the gradual progress of political and administrative reform in Britain, Mr. Hallam was qualifying himself by laborious historical investigations and by studies, at once various and profound, in the literatures of almost all the modern languages of Europe, for a course of authorship in which he had had, properly speaking, no predecessor in this country, and in which he is without a rival.

The first fruit of these investigations and studies was his 'View of the State of Europe during the Middle Ages,' published originally in two volumes 4to, in 1818. As a work of extensive and profound learning, written in a clear and classical style, and exhibiting a spirit of historical generalisation tempered by strict conscientiousness, the work at once took a high place not only in British literature, but in the literature of Europe. Mr. Hallam's next work was 'The Consti-

tutional History of England from the Accession of Henry VII. to the Death of George II., published in two volumes, 4to, in 1827; and this was followed by his 'Introduction to the Literature of Europe in the 15th, 16th, and 17th Centuries,' published in four volumes, 8vo, in 1837-39. A volume of 'Supplemental Notes' to his 'History of the Middle Ages' was published in 1848; embodying additional information procured, or modifications of views into which the author had been led since the publication of the main work. All the three works have gone through numerous editions—the 'History of the Middle Ages' being now (1856) in its eleventh or twelfth. They have all been translated into French and German. A new and uniform edition of Mr. Hallam's works is at present in course of publication; but to make it complete, the author's numerous scattered essays in periodical works and elsewhere would have to be collected. Among these minor writings one of the most interesting was a private memoir of his son, Arthur H. Hallam, who died in 1833 in the prime of his youth, after having won the most favourable opinions from all who knew him. This, the elder son of the venerable historian (a younger has since also died) is the A. H. H. of Tennyson's 'In Memoriam.' Mr. Hallam is a Fellow of the Royal and of numerous other societies; he is a trustee of the British Museum: he was also one of the original promoters of the Society for the Diffusion of Useful Knowledge. He survives among us yet, full of years and crowned with honours.

HALLER, ALBERT VON, was born at Berne, October 16th 1708, of an ancient and respectable family. His father, Nicholas Emmanuel von Haller, who was an advocate and had the reputation of being an able lawyer, died in 1721; but even at that time he could foresee the distinction which his son would attain, from the superiority which he evinced over his fellow-pupils. In early life Haller was feeble and delicate, being affected with rickets—a circumstance which, as his friend and biographer Zimmermann observes, not unfrequently tends to foster and develop the talents of a youth. He is said, at the age of nine, to have been in the habit of writing down each day all the unusual words he met with. He composed also short lives of nearly two thousand distinguished persons, after the manner of Bayle's dictionary, and formed a Chaldee grammar. A satire in Latin verse upon his master was known to have been written by him when only ten years old, and two years later he first began to compose verses in his native language.

His father had intended him for the church, but his own inclinations leading him to the study of physic, he went in 1723 to the University of Tübingen, where he lived with Duvernoy, afterwards professor of anatomy at St. Petersburg. Being but little satisfied with his progress there, he resorted in 1725 to Leyden, where the zeal and talent of the professors afforded him an opportunity of pursuing his studies in a manner more accordant with his wishes. At this university Boerhaave was then in the height of his fame, attended by 120 pupils, whose instruction was his greatest delight; and Albinus was delivering lectures on anatomy and surgery. Having enjoyed such advantages as these, it is not extraordinary that Haller should ever after speak with the greatest satisfaction of his residence at Leyden. About this time he visited Ruyssch at Amsterdam, then in his eighty-ninth year, and saw a portion of his celebrated collection of anatomical preparations, the superiority of which, he tells us, depended rather upon skill in manipulation than on any secret process. At the end of the year 1726 he offered himself for his doctor's degree, and delivered his thesis 'De ductu salivæ Coschwiziano,' which he showed to be merely a blood-vessel. In 1727 he visited London, where he became acquainted with Sir Hans Sloane and Cheselden; thence he went to Oxford, and thence to Paris, whence, having pursued his anatomical and surgical studies for some time under Winslow and Le Dran, he went to Basel to study mathematics under Bernoulli, and then returned to his native country and began to practise as a physician. In 1735 he was appointed physician to the hospital at Berne, and soon after principal librarian to the large public collection of books and medals; but these offices he did not hold long, for in the following year he was offered the professorship of medicine, anatomy, botany, and surgery, at Göttingen, by George II., which after some hesitation he accepted. Having declined practising, he devoted himself to the duties of his office with the greatest zeal, and especially exerted himself to increase the facilities for the study of anatomy. During eighteen years that he retained this appointment, while fully discharging all its laborious duties, he was a constant contributor to the different scientific 'Transactions.' In 1747 he published the first edition of his 'Præmiæ Linææ Physiologia,' which he had that year used as the groundwork of his lectures, having previously employed the 'Institutiones' of Boerhaave. In 1751 the Royal Society of Göttingen was established, and Haller, at whose house the first meeting took place, was appointed perpetual president. To their 'Transactions,' of which the first volume appeared shortly after under the title of 'Commentarii Societatis Regiæ Scientiarum Göttingensis,' he was a constant contributor, even after 1753, when, in consequence of the delicate state of his health, being obliged to leave Göttingen, he retired to Berne. Here he resided during the rest of his life, constantly occupied in the publication of his most important and voluminous works, in the cultivation of the science of his profession and of general literature, and in the active and honourable discharge of various duties in the service of the republic, in which he at all times strenuously advocated the cause of the

aristocracy. He died in October 1777, in the enjoyment of the highest reputation both as a citizen, a scholar, and a philosopher, his literary labours ceasing only with his life.

It would be difficult to determine how large a portion of the facts of medical science now most familiarly known we owe to the extraordinary labours of Haller. Some idea of the extent of his works may be formed from the fact that the titles of nearly two hundred treatises published by him from 1727 to 1777 are given by Senebier in his 'Eloge' of Haller, and that this list does not profess to be complete. He is unanimously received as the father of modern physiology, the history of which, in fact, commences with his writings. He was the first to investigate independently the laws of the animal economy, which had before been studied only in connection with the prevailing mechanical and chemical or metaphysical theories of the day. Commencing with a sound knowledge of anatomy, and of the structure of the organs in the dead body, he sought experimentally and systematically to discover the laws which governed their actions during life, proceeding from the most simple to the most complex phenomena. Excluding all the metaphysical explanations which Van Helmont and Stahl had invented, and all those deduced from mechanics and chemistry which were not clearly sufficient for the phenomena ascribed to them, he sought for powers peculiar to the living body, which he believed must govern the actions which he found occurring only in it. These he thought might be restricted to two—sensibility and irritability; the former seated in the brain and nerves, the latter in muscular fibre. In this he had indeed been partially anticipated by Glisson [GLISSON], who perceived the necessity of admitting an inherent property in muscular fibre, by which its contractions take place under the influence of certain stimuli; but the laws of this property, and the distinction between it and elasticity, had never been at all clearly determined. Haller thus illustrated these properties: the intestine removed from the abdomen, or a muscle separated from the body, is irritable, for when pricked or otherwise stimulated it contracts—yet it is not sensible; the nerves on the other hand are sensible, but not irritable, for when stimulated, though the muscles to which they are distributed are thrown into action, they themselves do not exhibit the slightest motion. Hence irritability, he said, cannot be derived from the nerves, for it is impossible they should communicate what they do not possess themselves; but he attributed a nervous power to some of the muscles as a necessary condition of their irritability, and supposed it to be conveyed to them during life from the brain through the nerves, and to govern their actions under the influence of certain undetermined laws. Proceeding to investigate further the laws of irritability, he found that it differed in intensity and permanency in different parts of the body. He found that it continued longest in the left ventricle of the heart, next in the intestines and the diaphragm, and that it ceased soonest of all in the voluntary muscles, and by reference to this superior degree of irritability he explained the constant action of the heart and diaphragm even during sleep. He denied all irritability to the iris, and believed that the action of light upon it takes place through the medium of the retina—a view since proved to be correct. He supposed the arteries to be supplied with muscular fibres, but that the cellular tissue around them prevented any motion from taking place in them; and he explained the accumulation of blood in an inflamed part, partly by the contraction of the veins and partly by the diminished contractility of the arteries. He endeavoured to prove by experiments that the tendons, the capsules of joints, the periosteum, and the dura mater, are entirely insensible, and that the pain which occurs in diseases of these parts ought to be referred to the affection of the nerves distributed to and around them; and in these and some other tissues which he held to be destitute of irritability he admitted a force analogous to elasticity, by which they contracted slowly and in a manner altogether different from muscular tissue when divided or exposed to cold, &c.

Such is a sketch of the great doctrine of irritability and sensibility on which Haller based all the phenomena of life, and around which he arranged all the facts of physiology known at his time in his 'Elementa Physiologia.' It gave the first impulse to the study of the laws of life as a separate and exclusive science; and though in some parts erroneous, and in many insufficient, it still contained enough of truth to form a firm basis for the observations collected during many successive years. His doctrines were strongly opposed by Whytt and others, and in the controversies that followed numerous new facts were advanced and the most important additions to physiological knowledge rapidly made. It was soon shown that the restriction of the vital powers to the two, as defined by Haller, was much too exclusive, for that there were many parts which, though they gave no evidence of possessing either of them, were not the less alive; while others to which Haller refused these properties gave sufficient demonstration of possessing them when excited by other and appropriate stimuli. Hence first originated the discovery of the fact that for the action of each organ a peculiar stimulus is required, and that each tissue has what Bichat, who illustrated it most completely, called a 'vie propre.'

But even if Haller had not attempted to establish any such great generalisation of vital phenomena as this, his learning and his admirable mode of studying physiology might have been sufficient to obtain for him a reputation nearly as high as that which he has always enjoyed. Possessed of a competent knowledge of all the sciences

which could throw any light on the actions occurring in the living body, he pointed out in numberless instances what part of them was to be attributed to the laws of inorganic matter and what to those peculiar to the state of life, while he carefully avoided admitting any of the former as sufficient by themselves to explain the whole of the latter, which had been the chief error of nearly all his predecessors. He rarely drew any conclusion respecting the mode of action of any organ or part in the human body without previously investigating the analogous function in the bodies of animals by dissection or experiment, and he tells us that he often found that questions to which no sufficient answers could be obtained by observations on the human body, were at once solved by his examinations in the various classes of animals. Deeply read in all the works of those who preceded him, and in all those of his contemporaries in every nation, he did not attempt to decide anything till he had considered all their statements and compared them with his own investigations; and hence each of his works contains so perfect an epitome of the labours of all former writers on the same subject, and a mass of evidence so extensive, that whatever errors the conclusions he sometimes arrived at may contain, they can never fail to be records of the highest value. At the same time the elegant and lucid style in which they are written, the result of the combination, almost unique, of the poet with the anatomist, has rendered them attractive, notwithstanding their great extent, to his successors in every country.

Haller was fortunate in receiving the high honours which he deserved during his life-time. In 1739 he was appointed physician to the King of England. In 1743 he was elected a Fellow of the Royal Society of London, and at different times subsequently of all the scientific societies of Europe. When George II. visited Göttingen in 1748 he was ennobled by the emperor; he was invited by Frederick the Great to settle in Berlin, with a handsome salary, to which no duties were attached, and was offered a professorship at Oxford and at Utrecht. He enjoyed throughout his life the friendship and esteem of the most eminent of his contemporaries throughout Europe; and, varied as his pursuits were, he acquitted himself in all with the highest honour and success. It would be impossible here to give a complete list of his original writings and compilations; few writers have ever been so voluminous; and it is extraordinary that, amidst all his personal and laborious investigations, he should have had opportunity for the composition of so extensive a library as they alone would form. A large portion were probably formed from the accumulation of notes which he had made in following out his system of invariably recording everything which appeared to him worthy of notice; a plan which, commenced, as we have seen, in childhood, he continued without intermission to the last years of his life. The following are his principal works:—

His chief political production, 'Versuch Schweizerischer Gedichte,' was published anonymously at Bern; afterwards two more editions of it were printed there, and four at Göttingen. Three editions of a French translation were also published. From 1750 to 1760 he was engaged in publishing, in 19 vols. 4to, a number of the most select disputations and theses in anatomy, surgery, and medicine; and from 1757 to 1766 his 'Elementa Physiologiae Corporis Humani,' undoubtedly the greatest work on medical science which the 18th century produced. It contains every fact and every doctrine of physiology at that time known, and is written in such a style of elegance and classical beauty that it is still a model for writers on the same subject. It appeared in 8 vols. 4to from 1757 to 1766, and a posthumous 'Auctarium' was published in 1782 in four 4to fasciculi. From 1774 to the time of his death he was engaged in publishing part of his 'Bibliotheca Anatomiae, Chirurgiae, Medicinæ Practicæ, Botanicæ, et Historiæ Naturalis,' which form altogether 10 vols. 4to, of which the publication was completed posthumously. They are composed principally of abstracts of the writings of all the most esteemed authors on each subject, so as to form a complete history of the doctrines of each science. His 'Icones Anatomicæ,' which were published from 1743 to 1756, contain most accurate and well-engraved representations of the principal organs of the body, especially of the arteries. The greater part of his contributions to the various scientific transactions, and of his shorter works, were collected in his 'Opera Minora,' in 3 vols. 4to, from 1762 to 1768. The most valuable of the papers contained in them are those on the Development of the Chick, on the Formation of the Heart and the Bones, on the Circulation, and on the Eye.

(*Das Leben des Herrn von Haller*, von J. G. Zimmermann, 1 vol. 8vo, 1756; *Senebier, Eloge de Haller*, Geneva, 1778; *Histoire de la Médecine*, par K. Sprengel.)

HALLER, JOHANN, a distinguished German sculptor, was born at Innsbruck in 1792. He studied in the Academy of Munich, and in his third year obtained the prize in sculpture, for a statue of 'Theseus raising the Rock to discover the Sandals of his Father.' He studied some time at Rome, and on his return executed many works in Munich for Ludwig of Bavaria, both whilst as prince and king; the principal of which are the models of the sculptures for the pediment of the Glyptothek, representing 'Pallas Ergane' (*Epyda*, the 'worker'), from a design by Wagner; the six colossal statues of the niches in the front of the same building, namely, Hephaestus, Prometheus, Dædalus, Pheidias, Pericles, and Hadrian; and the 'Caryatides' of the royal box

of the great theatre at Munich; besides a basso-relievo in the interior of the Glyptothek after a design by Cornelius, representing the 'Fall of the Giants;' and many busts of eminent men, some of a colossal size. He executed the bust of William III. of England for the Walkhalla. He died in 1826, aged only thirty-three.

HALLEY, EDMUND, was born October 29, 1686, at Haggerston, near London, at a country-house belonging to his father, who was a soap-boiler in Winchester-street, London. He was educated at St. Paul's School, under the care of Dr. Gale, and was placed at Queen's College, Oxford, in 1673, being then possessed of much erudition for his age, and a strong turn for observation, as appears by his having discovered for himself before he left school the alteration in the variation of the magnetic needle. At the university, being well supplied with instruments by his father, he began to apply himself to astronomy, and before he reached the age of twenty he had given (in the 'Phil. Trans.') a memoir on the problem of Kepler, had invented a method of constructing the phases of a solar eclipse, and had made many observations, particularly of Jupiter and Saturn, the results of which we shall presently see. Finding however that nothing could be done in planetary astronomy without more correct tables of the stars, and relying upon Flamsteed and Hevelius for the amelioration of the northern catalogues, he determined, with his father's consent and assistance, to appropriate to himself the task of forming a catalogue of the southern hemisphere. Furnished with a recommendation from Charles II. to the East India Company, he set sail for St. Helena in November 1676, and remained there two years. His 'Catalogus Stellarum Australium,' published in 1679, was the result of this voyage, and contains, besides the positions of 350 stars, some other points of interest, particularly an observation of the transit of Mercury over the sun's disc, and a hint that such observations might be employed to determine the sun's parallax (afterwards so successfully carried into effect with the planet Venus). He also notices the increased curvature of the moon's orbit when in quadratures, which was afterwards explained by Newton. In his voyage out he had observed the fact that the oscillations of a pendulum increase in duration as the instrument approaches the equator.

At his return from St. Helena the king granted him a mandamus to the University of Oxford for the degree of Master of Arts, and he was elected a Fellow of the Royal Society. This body sent him to Danzig in 1679 to judge of the observations of Hevelius, who maintained the superior accuracy of instruments with simple sights, in opposition to Hook, who advocated the use of the telescope. Halley was a man of rapid movements: in November 1678 he returned from St. Helena; in May 1679 he set out for Danzig, having in the interval published his catalogue, and procured his Oxford degree, and admission to the Royal Society. He returned from Danzig in July, and remained at home till the end of 1680, at which time he set out on a continental tour, accompanied by his schoolfellow Mr. Nelson, since well known as the author of a work on the Feasts and Fasts. In December, being on the road to Paris, he saw the celebrated comet of 1680 in its return from perihelion, being the first who perceived it since it was lost in the preceding month. This body he observed with Cassini at Paris, and the observations thus made are remarkable as forming part of the foundation upon which Newton, in the 'Principia,' verified his deduction of a comet's orbit from the theory of gravitation. He returned to England at the end of 1681, and in 1682 married the daughter of Mr. Tooke, auditor of the Exchequer, with whom he lived fifty-five years. He resided at Islington till 1696, and in 1683 published his theory of the Variation of the Magnet, followed by other papers in subsequent years, containing ingenious speculations, now forgotten. His astronomical occupations during this period consisted chiefly of lunar observations and comparisons. He was strongly of opinion that the moon would, when sufficiently known, furnish the means of finding the longitude, and at this period it seems that he had formed the idea of observing that body through a whole revolution of the nodes. His observations (1682-84) are published in Street's 'Astronomia Carolina.' He was interrupted however by the state of his father's affairs, which had suffered by the great fire.

Among other objects of speculation he had considered the law of attraction, which he imagined must be as the inverse square of the distance. Having applied in vain to Hook and Wren for assistance in the mathematical part of the problem (himself being more of a mathematician than either), he heard of Newton, and paid him a visit at Cambridge. Finding all he wanted among the papers of his new friend, he never rested until he had persuaded Newton to publish the 'Principia,' of which he superintended the printing, and supplied the well-known copy of Latin verses which stand at the beginning. In 1691 he was a candidate for the Savilian professorship, which he lost, according to Whiston, on account of his avowed unbelief of the Bible. This rests on the authority of Whiston, and of an anecdote to be found in Sir David Brewster's Life of Newton; and yet it is certain that he afterwards was appointed to the same professorship, and as he then obtained the degree of Doctor of Laws, which required no subscription to articles, it may be presumed his opinions, if known, were not considered to be a disqualification. Flamsteed, if we remember rightly, speaks of his opinions on this matter as things of common notoriety. In 1696 he was appointed comptroller of the mint at Chester, where he resided two years.

In 1698 King William, who had heard of his magnetic theory, gave him the commission of captain in the navy, with the command of a small vessel, and instructions to observe the variation of the magnet, and the longitude and latitude in the American settlements, and to attempt the discovery of land south of the Western Ocean. He set out in November, but was compelled to return by the insubordination of his first lieutenant. Having tried this officer by a court-martial, he set out again in September, with the same ship and another, observed in many parts of the Atlantic as far as the ice would permit, touched at the Canaries, Madeira, Cape de Verd Islands, St. Helena, Brazil, Barbadoes, and returned September 1700, not having lost a man by sickness during the whole of the voyage. He published in 1701 a chart of the variation of the magnet in all seas of the known world, and immediately afterwards sailed to survey the coasts of the Channel, of which he also published a chart. He was then twice successively ordered to the coast of the Adriatic, to assist in the formation and repairs of harbours in the emperor's dominions, and returned to England in November 1703, just in time to succeed Dr. Wallis, who had died a few weeks before, in the Savilian chair of geometry at Oxford.

If Halley was active and energetic, he was no less universal. The captain-professor found an unfinished translation by Dr. Bernard of a tract of Apollonius, and, though he did not understand Arabic, undertook to complete the work. [APOLLONIUS, BERGÆUS.] A manuscript Life of Halley in the Bodleian Library (read before the Royal Astronomical Society; see their 'Monthly Notice,' December 1834.) says, "This he did with much success, through his being so great a master of the subject, that I remember the learned Dr. Sykes (our Hebrew professor at Cambridge, and the greatest naturalist of his time when I was at that university), told me that Mr. Halley, talking with him upon the subject, showed him two or three passages which wanted emendation, telling him what the author said, and what he should have said, and which Dr. Sykes found he might with great ease be made to say, by small corrections he was by this means enabled to make in the text. Thus, I remember Dr. Sykes expressed himself, Mr. Halley made emendations to the text of an author he could not so much as read the language of." It is not necessary (after the article last cited) to say more of the splendid edition of the whole of Apollonius, published in 1710.

The 'Miscellanea Curiosa,' a collection of pieces, mostly from the 'Philosophical Transactions,' many of them by himself, was superintended by him, and published in 1708.

Halley resided at Oxford for some years after his appointment to the Savilian chair, nor do we know when he again became a permanent resident in London: it was however not later than 1713, for in that year he became secretary to the Royal Society. He had been assistant-secretary before, as far back as 1685, and the Transactions from 1686 to 1692 were superintended by him. From the manner in which his name is mixed up with the affair of Flamsteed, he must have resided in town for some years previous to 1713. [FLAMSTEED.] In the article cited we have called Flamsteed's work the *Principia* of practical astronomy; and it were to be wished the connection of Halley with the printing of this one had been as creditable as that which links his name with the '*Principia*' of Newton. It is difficult to say to what extent Halley was involved in originating any of the unworthy proceedings to which we allude; and we must protest against his being made a scapegoat for Newton, in which position even Flamsteed seemed inclined to place him, as well as several more recent writers on the controversy. Neither the position nor the character of Halley renders it likely that he would prefer making a tool of Newton to any direct mode of aggression. The committee appointed by Prince George of Denmark must bear the blame of all the formal proceedings; and in that committee the name of Halley is not found, though it is on the list of those who published the *Commercium Epistolicum*, a position which we cannot defend.

At the beginning of 1720, after the death of Flamsteed, Halley was appointed astronomer-royal. In the previous years he had been employed in completing his lunar and planetary tables, which were then ready to be published. But upon his appointment to Greenwich he revived his old idea of observing the moon through a revolution of her nodes. It was doubtful that at the age of sixty-four he should live to complete an undertaking which required nineteen years of health; but he did undertake it, and did live to finish it. The result is the comparison of nearly 2000 observed lunar places with his previously formed tables. He died on the 14th of January 1742-43, in the eighty-sixth year of his age.

The remarks on the personal character of Halley which appear in the eulogium of Mairan were furnished, it is asserted, by his friend Mr. Folkes, and their justice must be allowed so far as they speak of his prodigious information and activity. His disinterestedness in money matters is supposed to be attested by his request to Queen Caroline not to increase the salary of the astronomer-royal on his appointment to that office, lest it should afterwards become an object of ambition to incompetent persons; but, though allowing that Halley was not greedy of gain, we see but little to commend in this act of a man of independent fortune. The social qualifications of Halley were such as endeared him to his friends; and he could, when no partiality

stood in the way, be fair and just to others. Thus Mairan remarks on his not having treated either Des Cartes or Vieta with the injustice which their memory received from several English writers. It were to be wished that he had been as free from personal as from national prepossessions, and that Leibnitz and Flamsteed had received their due from the friend of Newton. In his edition of the observations of the latter [FLAMSTEED] he inserted a preface containing culpable misrepresentations, an account of which is to be found in Mr. Baily's work. We shall also cite the following suppression. In all the editions of the '*Synopsis Cometica*' published during Halley's life, a numerical deduction from observations is given, to which the following is appended:—"At the *moment* of the first example the comet was observed at London to be close to the second star of Aries, of which it was nine minutes north, and three minutes east; the observer being *Robert Hook*." But in the augmented edition left by Halley to be published with his tables, the comet, at the same *hour* as in the preceding, is nine or ten minutes north of the star of Aries, and nearly in the same longitude; the observer being no longer Robert Hook, but Auzout and another. Doubtless Halley had quarrelled with Hook (as almost everybody was obliged to do) in the interval; and though the example was evidently worked for comparison with Hook's observation, at the same *moment*, we find it struck out in favour of one by Auzout in the same *hour*.

But though the scientific fame of a philosopher be no excuse for that suppression of his faults to which biographers are prone, still less should the latter be allowed to colour our views of the former. Among the Englishmen of his day Halley stands second only to Newton, and probably for many years after the publication of the '*Principia*,' he was the only one who both could and would rightly appreciate the character and coming utility of that memorable work. His own attention was too much divided to permit of his being the mathematician which he might have been; but nevertheless his papers on pure mathematics show a genius of the same order of power, though of much less fertility, than that of John Bernoulli. We shall close this article with a brief account of his printed writings, and of the most remarkable points in them.

The separate works of Halley consist of the '*Catalogus Stellarum Australium*,' &c., London, 1679, translated into French by M. Royer in the same year; the work of Apollonius '*De Sectione Rationis*,' Oxford, 1706; the '*Conic Sections of Apollonius*,' Oxford, 1710; the unfortunate edition of Flamsteed's '*Historia Cœlestis*,' London, 1712; and the planetary tables published in 1749, though printed for the most part in 1717-19. The superintendence of this work is attributed to Bradley, though it is evident that he did not write the preface. Besides the preceding there are from eighty to a hundred memoirs, including many of small importance, in the '*Philosophical Transactions*.'

In astronomy we owe to Halley—1, the discovery and the detection of the amount of what is called the *long inequality* of Jupiter and Saturn, which he confidently expected would be shown to be a consequence of the law of gravitation, as was afterwards done; 2, the detection, by comparison of ancient and modern observations of eclipses, of the slow acceleration of the moon's mean motion; 3, the first prediction of the return of a comet—'*Halley's Comet*;' 4, the explanation of the appearance of Venus in the day-time at particular seasons, arising out of the now well-known method of estimating the brilliancy of the planet; 5, the recommendation to observe the transit of Venus for the determination of the sun's parallax.

The following is a list of the most remarkable labours of Halley out of astronomy, arranged in the order of publication:—1, on the variation of the compass; 2, the law according to which the mercury falls in the barometer while the instrument ascends, being the first application of this instrument to the measurement of heights; 3, theory of the trade-winds; 4, construction of equations of the third and fourth degree; 5, estimation of the quantity of vapour raised from the sea; 6, inquiry into the point at which Julius Cæsar made his entry into Britain; 7, tables of mortality, from observations made at Breslau, the first of the kind constructed; 8, application of Algebra to the problem of lenses; 9, method of constructing logarithms, a celebrated paper, reprinted in Sherwin's '*Logarithms*;' 10, improvements in the diving-bell. Those papers only have been mentioned which refer to points on which Halley's name is inseparably connected with the history of the progress of science.

(*Biographia Britannica*.)

* HALLIWELL, JAMES ORCHARD, F.R.S., was born in 1821. He is the son of the late Thomas Halliwell, Esq., of Sutton, in Surrey, and received his early education under the late Charles Butler, author of the '*Introduction to the Mathematics*,' &c. At an early age he devoted himself to antiquarian researches, more especially directing his attention to the literary history and antiquities of this country, as embodied in the various early works of prose or poetry. He is the author and editor of many books on this and cognate subjects, which he has brought to light and illustrated by the light of cotemporary history. He is chiefly known to the world by a variety of papers and more elaborate works on Shaksperian criticism, amounting, we believe, to between twenty and thirty in number. Of his original works the most important are his '*History of Freemasonry*,' his '*Life of Shakspeare*,' a '*Treatise on the Literature of*

the 16th and 17th Centuries,' and a 'Dictionary of Archaic and Provincial Words' (2 vols. 8vo, 1846). Mr. Halliwell is at present engaged upon an elaborate edition of the works of Shakspeare, now in the course of publication, in 10 vols. folio, by private subscription. He is married to a daughter of Sir Thomas Phillips, Bart., of Middle Hill, Worcestershire.

HALS, FRANCIS, an eminent portrait-painter, born at Mechlin, 1584, died in 1660. No artist of that time was superior to him except Vandyck, and very few could be compared with him. With the first merit of a portrait, that of strong resemblance, his pictures were executed with remarkable freedom and boldness: his colouring was extremely good, and the effect very striking.

HAMEL, JEAN BAPTISTE DU, was born in 1624, and died August 6, 1700. In 1632 he published a very peripatetic treatise on the 'Spherics' of Theodosius, which was followed by several other works on natural philosophy and astronomy. Upon the foundation of the Royal Academy of Sciences by Louis XIV. in 1666, Du Hamel was appointed secretary, which office he continued to hold till 1697, when he was succeeded by Fontenelle. His philosophical and astronomical works were collected and published at Nürnberg, 1681, in 4 vols. 4to, and in 1698 appeared his history of the Royal Academy and its transactions, from its foundation to the year 1700. This latter work, entitled 'Regis Scientiarum Academiæ Historia,' is the only one which possesses any value at the present day.

HAMILCAR, BARCAS, the leader of the popular party at Carthage, was appointed in the 18th year of the first Punic war (B.C. 247) to the command of the Carthaginian forces. We possess no particulars respecting his early life or the time of his birth; but we learn from Nepos ('Hamil.', c. 1) that he was very young when he obtained the command. He ravaged with his fleet the coasts of the Bruttii and the Epizephyrian Locrians, and afterwards seized upon a strong fortress in Sicily, which was situated between Eryx and Panormus. In this place he continued for some years, with very little support from the Carthaginian government; and although the Romans were masters of almost the whole of the island, they were unable to dislodge him. He frequently ravaged the southern coasts of Italy as far as Cumæ, and defeated the Roman troops in Sicily. On one occasion he took Eryx, which he held till the conclusion of the war. The Romans at length fitted out a fleet to cut off all communication between Hamilcar and Carthage; the Carthaginian fleet sent to his assistance was defeated by the Roman consul Lutatius Catulus (B.C. 241), and the Carthaginians were obliged to sue for peace. This was granted by the Romans; and Hamilcar led his troops from Eryx to Lilybæum, whence they were conveyed to Africa. But a new danger awaited Carthage. The Carthaginian treasury was exhausted; and it was proposed to the troops that they should relinquish a part of the pay which was due to them. The soldiers rejected the proposal, appointed two of their number, Spendius and Matho, commanders, and proceeded to enforce their demands. Being joined by many of the native tribes of Africa, they defeated Hanno, the Carthaginian general sent against them, and brought Carthage to the brink of ruin. In these desperate circumstances Hamilcar was appointed to the command, and at length succeeded in subduing them after the war had lasted three years and four months.

After the end of this war Hamilcar was sent into Spain (B.C. 238). He remained in Spain nearly nine years, during which time he extended the dominion of Carthage over the southern and eastern parts of that country. He fell in a battle against the natives, B.C. 229.

The abilities of Hamilcar were of the highest order; and he directed all the energies of his mind to diminish the power of Rome. Polybius states his belief (b. iii., p. 165-6, Casaubon), that his administration would soon have produced another war with the Romans, if he had not been prevented by the disorders in which his country was involved through the war of the mercenaries.

Hamilcar was succeeded in his command in Spain by his son-in-law **HASDRUBAL**, who must not be confounded with Hasdrubal the brother of Hannibal. He carried on the conquests of Hamilcar, and reduced almost the whole of the country south of the Iberus (Ebro), which river was fixed by a treaty between the Carthaginians and the Romans, B.C. 226, as the frontier of the Carthaginian dominions. Hasdrubal was murdered in his tent by a Gaul, B.C. 221, after holding the command eight years.

(Polybius, b. i. li.; Appian; Nepos.)

HAMILTON, ANTHONY. [GRAMMONT, COUNT.]

HAMILTON, DAVID, a Scotch architect, was born in Glasgow, May 11, 1768. Of his professional education and earlier studies little is known. We must therefore content ourselves with enumerating some of his principal works, which alone will show that he was extensively employed. At Glasgow, besides the Exchange, he erected the Theatre (1804), the Western Club House, the Glasgow, the British, and some other banks; and in the West of Scotland several private mansions of a very superior class, namely, Hamilton Palace, the princely seat of the Duke of Hamilton; Toward Castle, that of the late Kirkman Finlay, Esq.; Dunlop House, Ayrshire, for Sir John Dunlop; and Lennox Castle, for John Kincaid, Esq., of Kincaid, which last is considered one of his best works. Among the structures above-named, the one by which he will be most generally known is the Glasgow Exchange (erected about 1837-40), an insulated edifice

(200 by 76 feet) standing in the centre of a regular 'emplacement' or area of 300 by 200 feet. That end of the building which faces Queen-street is entirely occupied by an octostyle Corinthian portico, which besides being diprostyle has two inner columns behind the second and the seventh of those in front, consequently although there is exactly the same number of columns (twelve) as in the portico of the Royal Exchange, London, there is considerable difference of plan as regards the interior. Still more does the Exchange itself differ from the London one, since instead of being an open cortile like the latter, it is covered over, and forms a spacious room of about 100 by 65 feet, divided into three spaces on its plan by a range of seven columns on each side.

Hamilton was one of the few architects at a distance who entered into the competition for the New Houses of Parliament, on which occasion he so distinguished himself that one of the four 500*l.* premiums was awarded to him for his designs. On the completion of the Exchange he was complimented, in July 1840, by a public dinner, and the present of a service of plate, and gold box, &c., from the citizens of Glasgow. He was in fact universally respected no less for his probity and excellence of character than for his abilities.

He died at Glasgow, December 5, 1843, in his seventy-sixth year, leaving a son in the same profession, Mr. Thomas Hamilton of Edinburgh, architect of two of the most tasteful structures in that city; the High School, a happy application of Grecian Doric; and the new Physicians' Hall, completed in 1845, which, though a small façade, exhibits freshness of design, and is remarkable for the novel and effective manner in which the two statues are introduced.

HAMILTON, ELIZABETH, born at Belfast in Ireland, but probably of Scottish parentage, is deservedly remembered as an early advocate of an enlarged and intellectual system of female education, and as one of the leaders of that useful class of novelists who have placed the interest of their fictions, not in rare adventure and glowing description, but in the accurate portraiture of the daily workings of domestic life. We find little to tell of her personal history. It appears that she filled the office of governess to the daughters of a Scottish nobleman, for the eldest of whom her 'Letters on the Formation of the Religious and Moral Principle' were written. She died July 25, 1816, regretted and beloved. Her warm and sincere piety was untinged by severity, and her natural cheerfulness and lively talents rendered her delightful in society, and, in old age, a universal favourite with the young.

The following are her chief works: 'Letters of a Hindoo Rajah,' 1796; 'Modern Philosophers,' 1800, a clever, popular, and effective satire, intended to throw discredit on the sceptical and republican doctrines taught by some disciples of the French Revolution; 'Letters on the Elementary Principles of Education,' 1801-2; 'Life of Agrippina,' 1804, an attempt to make history interesting, by expanding it into something bearing the resemblance of a novel; 'Letters on the Formation of the Religious and Moral Principle,' 1806; 'Cottagers of Glenburnie,' 1808; 'Exercises in Religious Knowledge,' 1809; 'Popular Essays,' 1813. Of these, the 'Letters on Education,' in which she has very skilfully applied the principles of metaphysics to the subject of education, is the most sterling and important. As a novelist, she will be best recollected by the 'Cottagers of Glenburnie,' "a lively and humorous picture of the slovenly habits, the indolent temper, the baneful content, which prevail among some of the lower class of people in Scotland." This piece, though only the picture of humble life in a remote and obscure district, can never lose its interest, for the characters are true to nature, essentially, not locally true; and the pathos, the humour, the admirable moral lessons, are of all time, and independent of the national peculiarities under which they are conveyed.

HAMILTON, GAVIN, descended from a noble family of Scotland, spent the greater part of his life at Rome. Though not gifted with eminent genius for invention as an artist, yet a liberal education and refined taste enabled him to take a respectable place among the most distinguished of his contemporaries. His ability is shown in several subjects which he painted from the 'Iliad.' It is probable that he would have attained some lasting eminence, had he devoted more time and study to the practice of his profession. A considerable part of the latter period of his life was however dedicated, advantageously for the cause of the arts, to the discovery of ancient monuments. He opened scavo in many parts of the Roman territory, especially at Tivoli, in Hadrian's villa. In the Museo Clementino, the statues, busts, and bas-reliefs contributed by him form the most important portion, next to the treasures of the Belvedere; and many great collections in Russia, Germany, and England, are indebted to him for their chief ornaments. The 'Townley Gallery,' published under the superintendence of the Society for the Diffusion of Useful Knowledge, contains a list of the marbles procured by him for the collection of Mr. Townley. Neither the date of his birth nor death is certainly known: he died however between 1790 and 1800. However eminent his talents, they were excelled, says Fuseli, by the liberality, benevolence, and humanity of his character.

HAMILTON, SIR WILLIAM, a well-known diplomatist and lover of art, was born in Scotland in 1730. He began life, he says, "with an ancient name and 1000*l.*;" but he removed the discrepancy between his name and his fortunes by marrying in 1755 a lady of very large

property, as well as amiable and agreeable character. It is said that he was foster-brother to George III., which may account for his appointment in 1764 to be English ambassador at Naples, whence he was not recalled till 1800. His connection with the stirring events born of the French revolution, more especially with the brilliant exploits of Nelson in the Mediterranean, belong to the history of the period. The master-spirit in that troubled time was his second wife (married to him in 1791), the fascinating but most unhappy Lady Hamilton. [NELSON.] Sir William appears however to have maintained an unblemished character, except in the weak indulgence of his wife. He was made a Knight of the Bath in 1771, and a privy-councillor in 1791. His expenditure for special services at Naples was disallowed by the ministry, and he died, much impoverished, in England, April 6th 1803.

Immediately after his arrival at Naples he applied himself diligently to observe and record the volcanic phenomena of the neighbourhood; and the continued activity of Vesuvius from 1766 to 1771 gave him excellent opportunity for these researches, of which his great work, the 'Campi Phlegreæ,' Naples, 1776-77, 2 vols. fol., is a noble monument. It consists of a series of coloured plates, exhibiting the most remarkable volcanic phenomena and the scenery of the most remarkable spots with great vividness, accompanied by explanations in French and English. Sir W. Hamilton published a 'Supplement' to it in 1779, containing similar representations of the great eruption of Vesuvius in August of that year.

His collection of Greek and Etruscan vases (now in the British Museum) was very valuable: the foundation of them was laid by the purchase of the Porcinari collection at Naples in 1765. They gave rise to that splendid work, 'Antiquités Etrusques, Grecques, et Romaines, tirées du Cabinet de M. Hamilton,' 4 vols. fol., published at Naples, the two first volumes in 1766, the others at a later date. The profit of the work was assigned to the editor D'Hancarville. Many of the marbles now in the Townley Gallery of the British Museum came from the collection of Sir W. Hamilton. (See 'Library of Entertaining Knowledge, Townley Gallery,' vol. ii., index.)

Sir W. Hamilton took a lively interest in all subjects connected with art or with antiquity, especially in the progress of the excavations at Herculaneum and Pompeii, and the formation of the Museum of Portici. He was earnest in recommending to the Neapolitan government the great work of unrolling the Herculaneum manuscripts, but produced little effect on that most supine court. He himself bestowed a part of his income upon this object. Ten papers of his composition, upon matters observed during his abode in Italy, are printed in the 'Phil. Trans.' for the years 1767 to 1795 inclusive. His other works are—'Observations on Mount Vesuvius, Mount Etna,' &c., London, 1772; and 'Lettera sul Monte Vulture,' Naples, 1780.

HAMILTON, SIR WILLIAM, as head of the old family of the Hamiltons of Preston, in Haddingtonshire, inherited a baronetcy created in 1673, but for a time dormant. He was born on the 8th of March 1788, in Glasgow, where his father, Dr. Hamilton, was a professor in the university; and there he received the earlier part of his academical education. The Snell foundation of exhibitions in Balliol College has long been a prize for the more distinguished among the Glasgow students: Adam Smith among others owed his English education to it. As a Snell exhibitor Hamilton went to Oxford; and he took his degree with honours as a first-class man, proceeding afterwards to A.M.

In 1813 he was admitted a member of the Scottish bar. But law, except the Roman, did not receive much of his attention; and the only practice he ever had was the very little which became incumbent on him, when, after a time, he was appointed crown solicitor of teinds or tithes. Even while a very young man, he had acquired no small part of his singular and varied stock of knowledge; and mental philosophy began early to be his favourite pursuit. On the death of Thomas Brown, in 1820, he stood for the professorship of Moral Philosophy in the University of Edinburgh: but Mr. Wilson was the successful candidate. Next year, on the nomination of the bar, he became Professor of Universal History in the same university. This appointment, little more than nominal in respect of emoluments, was hardly better as to the performance of duty. The department is not in any way imperative on students; and it never commanded pupils unless for a while under the elder Tytler. Sir William, being, though not rich, yet independent of professional drudgery, was left, undisturbed and undiverted, to the prosecution of his studies and speculations. It was long before these bore fruits visible to any but his immediate friends. For the digesting of his thoughts he was nearly as independent of the necessity of writing, as his iron memory made him to be for the preservation of his knowledge; and he seems to have long shrunk from the toil of endeavouring to expound ideas, for which he did not hope to find an apt or sympathising audience. It was only, as he himself has declared, on the pressing request of the editor of the 'Edinburgh Review,' that he was induced, in 1829, to give to that periodical the first of a series of contributions, which closed in 1839, and which unfortunately constitutes as yet by much the larger proportion of his published writings. Those papers exhibit the variety of his learning not less than its depth; and the philosophical essays which were among them speedily found readers, who, if few, were competent to do them justice.

BIOG. DIV. VOL. III.

In 1836 he found his right place: he was appointed by the town council of Edinburgh, though not without a contest, to be Professor of Logic and Metaphysics in the University. He was, what very few of the Scottish professors holding offices thus designated have been, at home in both of the spheres indicated by the official title. The vague term which stands second, opened up to him in his teaching any walk he might choose to tread in the vast field of mental philosophy, of which he had probably in his studies traversed more than any other man then or now alive. The first title pointed his way to one special mental science, which he had studied in all its existing shapes, and which he now set about systematising in harmony with new lights that had dawned on his own mind. Instead of following the usual professional practice, of combining the whole matter of his instructions into one course of lectures, to be delivered in one and the same session (a term of six months in each year), he lectured alternately in the one named section and in the other—in Logic one year, in Metaphysics the next; and he had the gratification of defeating, after a whimsical squabble, an attempt of the town council, who are the legal administrators of that university, to force him into the common practice. His reputation and his influence now extended rapidly. Long before 1836, he had become celebrated in the learned circles of Germany, and had begun to be known and estimated by many at home: the most eminent foreign thinkers had concurred with not a few of our own, in pressing earnestly the pre-eminence of his claim to the Logic chair; and in England, as well as in Scotland, philosophical speculators discovered more and more plainly that, in those fragmentary treatises of his, there had been opened veins of thought which thinking men durst not leave untested. His teaching, again, now worked energetically on many young and ardent spirits gathered round him in his lecture-room. There is not evidence indeed that his logical lectures have as yet had much effect on his personal pupils. But the metaphysical lectures excited a keen interest in philosophy among all of his students who were qualified for severe abstract thinking; while they guided the thinking of not a few into channels in which it long or always continued to flow. He was, too, not less anxious in encouraging and directing for the young men wide philosophical reading, than in prompting them to active philosophical reflection and reasoning.

Sir William's studies seem to have been conducted, thenceforth, with a steadier view than before to systematic exposition and publication. Still the labour proceeded slowly. Academic business, and other temporary occasions of controversy, were somewhat too apt to interrupt the progress of one who was armed for warfare less ignoble. Among other things, he, himself a Presbyterian, published a pamphlet on the schism which split the Church of Scotland in 1843. Very soon, likewise, after that year, his health began to fail; and paralysis struck the right side of his body from head to foot. He was for a time utterly disabled from teaching, and was afterwards able to lecture only with frequent assistance. But the vigour, both of intellect and of will, was as unimpaired as it had been with Dugald Stewart under a similar calamity. His reading and thinking were still carried on; even his writing was so, not without very much aid from others. That more of his large designs were not executed, is a fact for which there were thus, in his latest years, but too sorrowful reasons. He had long worked at intervals on that which he had set himself as his first task, the annotating of the works of Thomas Reid. He aimed at showing the relations of Reid's system, both to older philosophical opinions on the one hand, and also to newer ones, especially to Hamilton's own metaphysical doctrines—doctrines which he himself always regarded, and firmly and thankfully represented, as having their essential germ and foundation in Reid, and as being merely a development of the 'common sense' philosophy to results made possible by a combination of scholastic and German methods. Sir William Hamilton's annotated edition of 'The Works of Dr. Thomas Reid' appeared in 1846, much of it having been printed long before. But all that has been published down to this date (1856) leaves it lamentably incomplete. On not a few problems of deep interest—on not a few also bearing closely on our comprehension of Hamilton's own system of thought, we are left with references, in foot-notes, to supplementary dissertations, of which not a word is yet given us; and a dissertation asserting his own peculiar theory of the Association of Ideas is broken off abruptly at the end of the volume. In 1852 appeared the first edition of a reprint, with large additions, of his periodical articles—'Discussions on Philosophy and Literature, Education and University Reform—chiefly from the Edinburgh Review.' Translations of several of the essays had previously been made into French, Italian, and German; Peisse's French translation and notes are particularly valuable. Sir William's regard for the Scottish school in philosophy next showed itself, not (unluckily) in the completion of his 'Reid,' and those further developments of his own doctrines which he had there promised, but in a tribute to the memory of another of its celebrated masters, from whom he had neither derived, nor professed to derive, much if anything in his own opinions. He undertook to edit, with notes, the collected works of Dugald Stewart. The publication, begun in 1854, is still uncompleted; and nothing has appeared of the biography which was to introduce it. In 1855, when in country-quarters, Sir William suffered fracture of a limb; and he died in Edinburgh on the 6th of May 1856. He has left a widow and family. The manuscripts of his lectures, in both divisions, are said to be in such a state, that they may easily be prepared for the press.

T

As those who knew Sir William Hamilton through his writings only cannot do full justice to the multifariousness of his knowledge; so likewise such as look chiefly to those of his writings which had personal bearings, will do positive injustice to the real likeableness of his personal character. He was undoubtedly a stern, and keen, and often eager controversialist, occasionally even a haughty one; in debate he never beat about for smooth words; and, absorbed in his love for science and learning, he sometimes forgot to be gentle towards those whom he thought to be erring or knew to be comparatively ignorant. He was watchfully jealous, also, (and once or twice, as in his controversy with Mr. De Morgan, needlessly and unjustly so,) of anything that looked like interference with his claims to originality in points he had thought out for himself. But even in controversy, if he did hit hard, he never struck a man from behind; and the same chivalrous openness marked all his dealings. Under the combative tendency, moreover, there lay great generosity, great kindness and warmth of heart: he was invariably amiable when occasion did not force on polemics: he was an active and steady friend, beloved as well as esteemed by those who were admitted to his friendship.

About his erudition there cannot well be two opinions among those who have had opportunities and competency for judging. Its mere mass was a thing extraordinary: it was minutely exact in all those points which raise the question of accurate scholarship: it spread over tracts of reading the most obscure and neglected: and it was, everywhere, the real knowledge of a thinking man, not the word-cramming of a pedant. His range embraced all the great divisions of knowledge, except mathematics and physical science; while here too it did not exclude anatomy, with physiology and some other branches of medicine. He was a thorough linguist in the classical tongues, and in German. With as little as possible of the poetical temperament, he was well read in the great poets; and his historical information was unusually extensive. In philosophy, he was familiar with the Greek writers one and all: Aristotle and his commentators he had probably studied more extensively and profoundly than any even of our Teutonic neighbours. He knew the whole course of the scholastic philosophy, as no man else has ever known it since the middle ages departed. With British systems it is needless to say that he was familiar in all directions; and he was the only man among us who came near to having studied—and nowhere either carelessly or at second-hand—all the German systems that have emerged or diverged from that of Kant.

On the other hand, this question may be put: not whether Hamilton was the most original of philosophers; but whether there has ever been any philosopher who, to learning even half as great as his, united so much of real and active originality as a thinker. In his treatment of details he has a favourite manner, which often disguises his independence. He likes the position of an interpreter: he is wont to speak as if the best way of discovering philosophical truths were by decyphering them in some mediæval text through the dust of centuries. He takes a pride in quietly fathering, on some schoolman or other, a doctrine or an argument which many men would have been too glad to take credit for as their own; and sometimes, half-hidden in a brief note, there is given, as an obvious and matter-of-course comment on a scholastic brocard or term, some assertion which proves on close inspection to presuppose a wide process of new inference. The outlines, however, of those sections in his own philosophical creed which he has taken the trouble to expound, are laid down broadly enough to let their character be seen clearly. Be his leading doctrines held true or false, valuable or worthless, they are at least his own,—as much his own as very many systems which all of us rightly admit to be essentially novel,—as much his own, it may be said, as any system of philosophical opinions can be, unless it ignores everything that great thinkers have ever thought before.

What may be the correctness, and what the value, of his peculiar opinions, is a question on which, if it were to be adjudged at present, contradictory verdicts would be given. Probably no one will be competent to decide it justly, till there has taken place a long and intelligent sifting of speculations, which travel in a track, not only at several points new in itself, but likewise, everywhere, little familiar to most thinkers in this country. Hamilton's writings are Germanic rather than British; and that not merely in the freedom with which he has taken German doctrines and methods (with a large admixture of Scholasticism) as materials to be distilled in his own alembic. The exotic character is observable, both in his highly speculative aims, and in his severe exactness of technical expression. The former of these characteristics is distinctively alien to the broadly practical English mind; and the latter is one which has never, before him at least, been made to take root in the philosophic mind of Scotland. Nor can his writings be mastered without pains. He never cares for doing more than saying what he thinks to be worth saying—saying it unequivocally, and saying it in the smallest number of words that is consistent with safety. He will not turn aside to amuse us; he will not hurry or rise to excite us. He is a hard thinker, and a hard, vigorous, precise, dry, writer. But for such as will take the trouble to follow his course of thought, and reflect on its contents, there are perhaps no philosophical discussions, certainly none of our times, that are so suggestive of processes of thought—processes wide in range, definite in direction, and lofty in design and in possible result.

Of Hamilton's Psychological and Metaphysical doctrines, nothing

special requires to be said. They are before us, in certain parts, in his own exposition; and that they have already been much discussed, and have in some quarters excited a powerful influence on speculation, is a good omen for philosophy. We have, especially, his treatment of three great problems in philosophy. First, there is his theory of the two kinds of human knowledge, Immediate and Mediate. Secondly, there is a special application of this theory to the construction of a theory of External Perception. Thirdly, there is an exhaustive system of Metaphysics Proper, or Ontology, in his 'Philosophy of the Conditioned,' or 'Conditions of the Thinkable'—a vast and noble idea, traced out for us, as yet, in nothing but a tantalising fragment.

Regarding his Logical system, our public information is still very unsatisfactory. It is to be gathered from an appendix to his 'Discussions,' and an authorised but meagre publication from lectures, Daynes's 'New Analytic.' These materials will probably convey no distinct notion of the system, unless to readers who are familiar with the German methods of logical analysis since Kant. The leading points may be said to be four; and it is perhaps possible to make these intelligible, very briefly, to persons acquainted with the outlines of the science in its received forms. 1. Hamilton insists on having, in all propositions through common terms which are set forth for logical scrutiny, a sign of quantity prefixed to predicate as well as to subject. The point, though merely one of form, is curiously suggestive of difficulties, and hence of solutions. 2. Instead of recognising only four forms of propositions, the A, E, I, O, of the old logicians, he insists on admitting all the eight forms which are possible. (See Thomson and Solly.) 3. He widens the range of the syllogism, by admitting all moods which can validly be constructed by any combination of any of his eight kinds of propositions. 4. The Port-Royal doctrine, of the inverse ratio of the extension and comprehension of terms, is worked out by him in its reference to the syllogism. This application of the doctrine has certainly not been anticipated by any logician; and, when elaborated to its results, it throws many new lights on the character and mutual relations of the syllogistic figures.

HAMILTON, WILLIAM, of Scotch descent, but probably born in London about the middle of the 18th century, studied at a very early age under Zucchi, the painter of ornaments, at Rome. After his return he soon obtained general employment. He was engaged in various works, such as the Shakspeare Gallery, Maoklin's Bible, &c. He excelled in ornament, to which he gave propriety, richness, and a classic appearance. He died in 1801.

HAMMOND, HENRY, a learned and excellent divine of the Church of England, was born at Chertsey, August 13, 1605. Having been educated at Eton, and Magdalen College, Oxford, of which he became Fellow, he was presented to the rectory of Penhurst in Kent, in 1633, ten years after which he was appointed archdeacon of Chichester. By birth and education a confirmed royalist, he retired to Oxford soon after the civil war broke out, continued to reside there while that city was held by the king, and attended the king's commissioners to Uxbridge, where he disputed with Vines, a Presbyterian minister. He was appointed canon of Christchurch and public orator in 1645, and attended Charles I. as his chaplain from the time when he fell into the hands of the army until the end of 1647, when the king's attendants were sent away from him. Hammond then returned to Oxford, and was chosen sub-dean of Christchurch, from which situation he was expelled in March 1648, by the parliamentary visitors, and placed for some time in confinement. On his release he repaired to Westwood in Worcestershire, the seat of Sir John Packwood, where the remainder of his life was spent in literary labour, "doing much good to the day of his death, in which time he had the disposal of great charities reposed in his hands, as being the most zealous promoter of almsgiving that lived in England since the change of religion." . . . He died after long suffering from a complication of disorders, April 25, 1660. It is said that Charles II. intended for him the bishopric of Worcester. Hammond was a man of great learning, as well in the classics and general philology, as in doctrinal and school divinity, and possessed considerable natural ability. Of his numerous works, chiefly controversial, the following are some of the most remarkable:—'Practical Catechism,' 1644; 'Humble Address to the Right Hon. the Lord Fairfax and his Council of War,' 1649, concerning the impending trial of Charles I.; 'Paraphrase and Annotations on the New Testament,' 1653, best edition 1702. He began a similar paraphrase of the Old Testament, but advanced no farther than the Psalms, 1659, and one chapter of Proverbs. His works, in four volumes folio, were collected by his amanuensis Fulman, 4 vols. folio, 1674-84. (Bishop Fell, *Life*; Wood, *Athen. Oxon.*)

HAMMOND, JAMES, was born in 1710, and was the second son of Anthony Hammond, Esq., of Somersham Place, Huntingdonshire. He was educated at Westminster; sat in Parliament for Truro, on the interest of the Prince of Wales, whose equerry he was, and died in 1742. His verses are mostly elegiac, and addressed in the rapid style of pastoral sentiment, then in fashion, to a fictitious object, whom he names Della. He is said to have been in love with a Miss Dashwood, who refused him—if she read his poems it is hard to say how she could do otherwise—and to have lost his intellects in consequence of her cruelty. Few in this age are likely to differ from Dr. Johnson in his somewhat oracular opinion that "these elegies have neither passion, nature, nor manners."

HAMPDEN, JOHN, the eldest son of William Hampden, of Hampden, in Buckinghamshire, and his wife Elizabeth, second daughter of Sir Henry Cromwell, of Hinchinbrooke, in Huntingdonshire, and aunt of the Protector, was born in London in 1594, and succeeded in his infancy to the estates of his ancient and respectable family. He was educated first at a grammar school at Thame, afterwards at Magdalen College, Oxford, and in 1613 was admitted a student in the Inner Temple, where he made considerable progress in the common law. In 1619 he married at Pyrton, in Oxfordshire, Elizabeth, only daughter of Edmund Symeon, and for some years continued to lead a country life, entering freely into field sports and other amusements of his age. His attention however was likewise directed to the political struggles of the day; so that when the king was by necessity compelled to summon a parliament, Hampden became anxious for a seat in the lower house. The borough of Grampond first returned him to parliament; the borough of Wendover next elected him three successive times. He was then chosen by the county of Buckingham, and being doubly returned to the Long Parliament by the constituencies of Wendover and Buckinghamshire, he made his election for the county. In 1634 his wife, to whom he was tenderly attached, died, leaving nine children—three sons and six daughters: Elizabeth, the eldest, married Richard Knightley, of Fawsley, in Northamptonshire; the second, Anne, became the wife of Sir Robert Pye, of Farringdon. Mrs. Knightley, Hampden's favourite daughter, died during the first year of the civil war. He married, for his second wife, Lætitia, daughter of Mr. Vachell, of Coley, near Reading: by this lady, who survived him, it does not appear that he had issue.

In the first short parliament to which he was elected, Hampden took no very forward part in the business of the house; but his opinions coincided with those of Pym, Selden, and others of the popular party, who were determined to resist the unwarrantable encroachments of the crown upon the privileges of the parliament and the rights of the people. Gradually his influence increased both in and out of parliament, and especially in his native county of Buckingham. At length his reputation became general. At the close of Charles I.'s second parliament, the king, in pursuance of his threat to resort to new modes of raising supplies, required a general loan; to this loan Hampden resolutely refused to contribute, denying the king's right to demand it. In consequence of this refusal he was imprisoned in the Gate-house, removed thence in custody to Hampshire, but was afterwards, with seventy-six others, unconditionally liberated by an order of council. He now became one of the most industrious members in the house, both in its general business and the superintendence and conduct of committees. His resistance to the arbitrary imposition of ship-money (1636) induced many other residents in Buckinghamshire to follow his example. Proceedings were instituted against him on the part of the crown. The case was argued in the Exchequer Chamber (1637) during twelve days before all the twelve judges, who, two excepted, gave a decision in favour of the crown. It is remarkable that there is no appearance of an assessment of ship-money having been made upon the county of Buckingham after Hampden's trial. The judgment however which was then given strengthened the claim which the king had made to the power of taxing in any manner and to any extent, and the fear of oppression began to operate as an inducement to emigration. Many, especially among the Puritans, had already left the kingdom, and more were preparing to do so, when an order from the king, dated April 1638, prohibited all ships from sailing with passengers unless with a special licence. Eight ships were then lying in the Thames for the reception of emigrants; in one of which had engaged their passage across the Atlantic two no less considerable persons, it is said, than Oliver Cromwell and his kinsman Hampden: to this ship a licence was refused. (Lord Nugent's 'Memorials of Hampden,' vol. i. p. 254.)

For an account of Hampden's conduct generally in the Long Parliament we must refer to Lord Nugent's 'Memorials of Hampden,' to Clarendon, Whitelock, and the general histories. His resistance to the undue influence of the king so irritated Charles I., that the king accused him, with three other members of the Commons and one of the Lords, of having traitorously endeavoured to subvert the fundamental laws and government of the kingdom, and even made an attempt in person to seize them in the House. The House protected them from seizure, but violent debates and tumults arose, which were shortly after followed by the civil war. Hampden now raised and commanded a troop, with which he joined the Parliamentary army, acting chiefly in Berkshire and the counties of Oxford, Northampton, Warwick, Middlesex, and Buckingham. Being a member of the Committee of Public Safety, as well as a military leader, he was incessantly and variously occupied in all the affairs of the war. His counsel was for vigorous and resolute measures; he considered that Essex, the parliamentary general, should have acted more on the offensive. In an engagement with Prince Rupert upon Chalgrove Field, June 18, 1643, Hampden placed himself at the head of the attack, but in the first charge received his death-wound. Two carbine balls struck him in the shoulder, and, breaking the bone, entered his body: he left the field, and obtained surgical aid at Thame, but the wound was incurable, and after six days' severe suffering he expired.

Historians of the most opposite parties unite in unanimous praise

of this great man: all bear testimony to his affability in conversation; his temper, art, and eloquence in debate; his penetration in counsel; his industry, vigilance, and enterprise in action, and his courage in war. His last words were a touching and beautiful prayer for the welfare of his country.

HANDEL, GEORGE FREDERICK, who, from having passed nearly the whole of his life in this country, and produced in it all his great works, the English feel some right to claim as their own, was born at Halle, in Saxony, on the 24th of February 1684. He was the issue of a second marriage, which his father, an eminent physician and surgeon, contracted after he had reached his grand climacteric. This son of his rather advanced age he destined for the profession of the civil law, but the child's passion for music, his sacrifice of play-hours, often of his meals to its pursuit, and the determined manner in which he evaded or resisted all attempts to divert him from a purpose nature seems to have prompted, at length softened the obduracy of his father, who, by the earnest advice of the Duke of Saxe-Weissenfels, placed him under Friedrich Zachau, organist of the cathedral of Halle, an excellent musician. This professor soon made so willing a pupil acquainted with the principles of the science and the laws of harmony; he then placed in his hands the best works of the greatest composers, without directing his attention to any one in particular, thus leaving him to form a style of his own out of an acquaintance with numerous models of acknowledged superiority. So successful was this plan of education, that the youthful student composed a set of sonatas when only ten years of age, which was in the possession of George III., and probably still forms a part of the Queen's library.

Handel continued his attendance on the same master till he attained his fourteenth year, when he was taken to Berlin, where the Italian opera was flourishing under the direction of Bononcini and Ariosti, afterwards his rivals in London. He there attracted the notice of the elector, who proposed to send him to Italy, which offer, for some reason unknown, was declined by his father, who shortly after died; and from this period we lose all trace of the young Handel till the year 1703, when he reached Hamburg, in which city he may be said to have commenced his professional life. He there found Reinhard Keiser in the office of director of the opera, a composer of the highest celebrity, but whose expensive and somewhat dissipated habits led him frequently to absent himself from his post, on which occasions Handel was appointed to fill his situation, a preference so irritating to Mattheson, an able musician and a voluminous writer on the art, that he violently assailed his favoured rival. A duel ensued, and nothing but a score, buttoned under Handel's coat, on which his antagonist's weapon broke, saved a life that soon proved of such inestimable value. Shortly after this he was employed to set a drama entitled 'Almeria,' the success of which was remarkable; it ran thirty nights uninterruptedly. Next year he produced 'Florida,' and 'Nerone' in the year following, both of which were as favourably received as his former work. He now found himself possessed of the means of visiting Italy, then the land of song. At Florence he was welcomed in the most flattering manner by the grand-duke, and there, in 1709, produced the opera of 'Rodrigo,' for which he was rewarded with a hundred sequins (50*l.*), and a service of plate. He then proceeded to Venice, and brought out his 'Agrippina,' which was performed twenty-seven nights successively. In this, we are told, horns and other wind instruments were first used in Italy, as accompaniments to the voice.

Quitting Venice, where his music is said to have made an impression on the famous beauty and singer, Signora Vittoria, a lady particularly distinguished by the grand-duke, but which the young composer did not reciprocate, Handel went to Rome, where he was hospitably entertained by the Cardinal Ottoboni, who had in his service a band of excellent performers, under the direction of the famous Corelli [CORELLI], with whom, as well as with Domenico Scarlatti, the young Saxon speedily formed an acquaintance. There he produced 'Il Trionfo del Tempo,' the text written for him by the Cardinal Pamphili, and a sacred opera, a kind of mystery, 'La Resurrezione.' The former altered and enlarged, with English words by Dr. Morell, he afterwards brought out in London, as an oratorio, under the name of 'The Triumph of Time and Truth.' From Rome he advanced to Naples; but being anxious to return to Germany he declined many proffered engagements, and in 1710 reached Hanover, finding there a generous patron in the Elector, afterwards George I., who soon appointed him his *Maestro di Capella*, with a salary of 1500 crowns, on condition that he would, on the termination of his travels, return to perform the duties of his office.

In 1710 this great musician first arrived in London, and was soon honoured by the notice of Queen Anne. Aaron Hill, then manager of the opera, having formed a drama from Tasso's 'Gerusalemme Liberata,' which Rolli worked into an opera under the title of 'Rinaldo,' Handel set music to it, and it was produced in March 1711. He then returned to Hanover; but the attractions of London brought him back the following year to this metropolis, which thenceforward became his home. At the peace of Utrecht he, by the queen's command, composed a 'Te Deum' and 'Jubilate,' for the rejoicings on that event. A pension of 200*l.* was the reward of this service. His promise to return to Hanover was now either forgotten or its fulfilment delayed; and when in 1714 the unexpected demise of Queen Anne placed the Elector of Hanover on the British throne, Handel, taken by surprise

and conscious of having offended his patron, did not dare present himself at court. But his friend Baron Kilmansegge, having contrived that he should meet the king, during a royal excursion on the Thames, with a band of wind-instruments, playing the charming 'Water-Music,' written for the occasion, the composer was again received into favour, and never after lost the royal protection. His pension was immediately doubled; and many years after, when appointed to teach the princesses, Queen Caroline, consort of George II., added another 200*l.* to the former grants; making altogether 600*l.* per annum, no small income at that period. From 1715 to 1718 Handel was an inmate in the house of the Earl of Burlington, where he constantly met Pope, whose regard for the German composer is manifest from all he said and wrote concerning him. During the same period he produced three operas, 'Amadis,' 'Teseo,' and 'Il Pastor Fido,' besides several detached pieces. In 1718 he undertook the direction of the Duke of Chandos's chapel at Cannons, for which he composed many fine anthems. He there also produced most of his concertos, sonatas, lessons, and organ fugues; his 'Acis and Galatea,' for which Gay furnished him with the poetry; and the oratorio of 'Esther.'

The busiest, but not the most fortunate, period of Handel's life now arrived. The English nobility formed a project for converting the Italian theatre into an Academy of Music, a title borrowed from the French, and engaged Handel as manager, with a condition that he should supply a certain number of operas. In consequence, he went to Dresden to engage singers, among whom was Senesino. His first opera was 'Radamisto,' the success of which was unparalleled. But Bononcini and Ariosti, before alluded to, had been attached in some measure to the theatre; and having powerful friends, opposed themselves to the German intruder, as they insolently called the great composer. Hence those feuds, among the weak people of fashion, of which the remembrance is perpetuated by Swift's well-known epigram. To calm these it was proposed that an opera in three acts should be produced, and that each of the contending composers should set one act. The drama chosen was 'Muzio Scevola.' Handel's portion was declared the best; "but, strange to say, though each no doubt strained his ability to the utmost in this struggle, not a single piece in the whole opera is known in the present day!" Handel now, master of the field, produced about fifteen new operas; but that spirit of cabal often caused and always encouraged by the weak, that is the larger, part of the ranks of fashion, compelled the great composer and able manager to retire from the theatre in 1726 with the loss of 10,000*l.*, and a constitution much damaged by incessant labour and constant turmoil. A slight paralytic affection was the consequence, which however the baths of Aix-la-Chapelle removed. He then made an attempt to give operas at Covent Garden Theatre, but this proved equally mortifying and unprofitable. However the vexations and losses he encountered at the Italian Theatre ultimately led to the advancement of his fame and the repair of his fortune. He now announced performances during the Lent season, in imitation of the Concerto Spirituale, which he called oratorios, and at Covent Garden gave several, most of them composed for the occasion. Still the receipts at these did not indemnify him for the expenses he incurred: even his sublimest work, 'The Messiah,' was as ill attended as received in the capital of the empire, when first produced in 1741.

These failures were imputed, and justly, to the hostility of the nobility, who, notwithstanding the unvaried patronage of the royal family, still pursued him with unabated rigour. From such persecution he determined to seek refuge in Ireland, then noted for the gaiety and splendour of its court—a circumstance to which Pope alludes in a well-known appeal to the Goddess of Dulness.

"On his arrival in Dublin," says Dr. Burney, in his 'Commemoration of Handel,' "he, with equal judgment and humanity, began by performing 'The Messiah' for the benefit of the city prison." He remained in Ireland about nine months, and had every reason to be satisfied with his visit. Returning to London in 1742, he renewed his oratorios at Covent Garden Theatre, beginning with 'Samson.' From this time success attended all his undertakings. His last work drew crowds to the house, and 'The Messiah' was equally attractive. The latter was, during a long period, performed annually at the Foundling Hospital, and alone added 10,300*l.* to the funds of that institution. It is next to impossible to calculate what it has produced to other charities; the amount must be prodigious, while it has been a never-ceasing stream of prosperity to the musical profession, and of enjoyment to the musical public. He continued his oratorios to nearly the last day of his life, deriving considerable pecuniary advantage from them; for though still opposed by most of the nobility, the king (George II.) and the people actively supported him.

Late in life Handel was afflicted with blindness; he nevertheless continued to conduct his oratorios, and, as usual, performed concertos and other organ pieces between the acts. He even composed, employing as his amanuensis Mr. John Christian Smith, and assisted at one of his oratorios a week only before his decease, which took place on a Good Friday (according to his wish, it is said), April 13th, 1759. He was buried in Poets' Corner, Westminster Abbey, where a monument by Koubilliac is erected to his memory. A still more honourable tribute was in the year 1784 paid to his memory, by giving a series of performances in the great fans within which his remains were interred. A century having elapsed from the time of his birth, it was

resolved that a 'Commemoration of Handel' should take place. The management was entrusted to the directors of the Ancient Concerts, and eight of the most distinguished members of the musical profession. The king, George III., zealously patronised the undertaking, and nearly all the upper classes of the kingdom seconded the royal views. The receipts at five performances amounted to the sum of 12,736*l.*, the disbursements to rather more than 6000*l.*; of the profits, 1000*l.* was given to the Westminster Hospital, and the remainder to the Society for Decayed Musicians. It is perhaps right to be added, the inhabitants of Halle, his native town, are already making preparations for a centenary festival to be held in honour of him there in 1859 (the 100th anniversary of his death), the proceeds to be applied to the erection of a statue of him at Halle.

Handel was great in every style: in sacred music, especially of the choral kind, he not only throws at an immeasurable distance all who preceded and followed him, but reaches that sublimity which, it is now almost universally admitted, the art is so capable of attaining. Till within the last few years his works were unknown out of the British Isles; now they are heard with admiration in every part of Germany, in France, in Russia, and in the United States. The glory of Handel indeed, unlike that of many another great composer, appears still to increase with the lapse of time, and to be scarcely even temporarily eclipsed by the perversities of fashion.

It is worthy of remark, especially as an evidence that the intellectual powers do not necessarily decay in proportion to the diminution of bodily activity, that most of Handel's greatest works were composed when he was between fifty-four and sixty-seven years of age. 'Jephthah' was produced at the latest moment of that period. And here we may in passing observe, that the finest offsprings of Haydn's genius had their birth after he had become a sexagenarian.

In the Queen's library are the original manuscripts of nearly all Handel's works, filling 82 large folio volumes. These include 32 Italian operas, 23 oratorios, 8 volumes of anthems, 4 of cantatas, 3 of Te Deums, and a Jubilate, together with concertos, sonatas, &c. Not in the royal collection are 11 operas, harpsichord lessons, fugues, organ concertos, water-music, &c. &c. Of the oratorios, 'Deborah' was first performed in 1733, 'Israel in Egypt' in 1738, 'Saul' in 1740, 'Messiah' in 1741, 'Samson' in 1742, 'Judas Maccabeus' in 1746, 'Joshua' in 1747, 'Solomon' in 1749, and 'Jephthah' in 1751.

* HANKA, WACLAW or WENCESLAUS, a Bohemian poet and antiquary, whose name is inseparably connected with some of the finest monuments of Bohemian literature, was born at the village of Horenewes on the 10th of June 1791. Up to the age of sixteen the only education he received was that which he obtained at the parish school in winter, and his chief occupation in summer was tending his father's sheep. From some Polish and Servian soldiers who were quartered on his father's farm he learned their respective languages, which are closely akin to the Bohemian, his native tongue, to which he early manifested a strong attachment. With the German he was at that time so unacquainted that, when sent to the grammar-school of Königgrätz, the teachers allowed him by special favour to draw up his exercises in Bohemian, though German was the ordinary language of the school. The object of his parents in sending him to study was to protect him from the military conscription, which in Bohemia did not extend to scholars; but it was soon discovered that learning was his proper vocation. He afterwards studied philosophy at Prague, and while at the university there, proposed and established a society for the cultivation of the Bohemian language, which had unexpected success. At Vienna, where he studied law, he even set on foot a Bohemian periodical. His zeal in the cause introduced him to the acquaintance of Dobrowsky [DOBROVSKY], who had then been for thirty years the most active and distinguished cultivator of Bohemian literature, and who became Hanka's warm friend, instructor, and patron. On the foundation of the Bohemian Museum, at the former palace of Count Sternberg, in the Hradschin of Prague, about 1817, Hanka was appointed its librarian, apparently at Dobrowsky's recommendation. Nearly at the same time probably took place his earliest appearance as a poet, in a first volume of verses under the title of 'Hankowy Pjane,' to which a second has never been added, though a second edition of the first was published in 1819. In 1817 he commenced the issue of the 'Starobyla Skladanie,' a collection of early Bohemian literature, especially poetry, chiefly derived from unpublished manuscripts. The series extended altogether to eight small volumes, and was not completed till 1824. The contents, which comprise among other things a narrative poem on the subject of King Arthur, are of little interest except to the Bohemian antiquary; but in the course of collecting the materials for this work a manuscript of a most remarkable character came to light in a very singular manner. On the 16th of September 1817 Hanka went to the church-tower at the little town of Kralodvor, or Königshof, to see a bundle of arrows which he was told had lain in the under-vault of the tower from the time of Ziaka, the Hussite chieftain of the 15th century, who had plundered the town. While walking about the vault he informs us that his foot struck against something, which on taking up he found to be a bundle of parchment documents, and which a further examination showed to consist of a number of poems in the Bohemian language. In a few days he sent to the authorities of the town a transcript of some of the poems; they in recompense presented him with the original manu-

script, which he in turn presented to the Bohemian Museum, where it now forms one of the principal treasures of which he is the guardian. Such is the history of the discovery of the manuscript of Kralodvor, or of 'the Queen's Court,' as it has sometimes been called in English. There has been much controversy as to the date of the composition of the poems, some of the Bohemian antiquaries being disposed to assign them to the old heathen times to which their subjects refer, while others contend that they were composed as recently as the year 1810. At one time it was suspected by many that the date of their composition was the 19th century, and that the author and discoverer were one. Whatever may be the date, or whoever may be the author, there can be no doubt that they form the most original and interesting volume that Bohemian literature has to show. Of the poems which the manuscript contains, several are of a narrative and some of a lyric character, the former relating to passages in the ancient history of Bohemia. One, which is particularly spirited, contains the description of a tournament connected with a love-tale; another relates the Tartar invasion of Europe under the command of Kubla Khan. In the poem or ballad on this invasion, a distinguished part is assigned to an English knight who fought on the Bohemian side, and who is described by the name of Weston—a sufficiently near approach to Weston. We are not aware if it has been observed by the Bohemian critics that it is a remarkable coincidence that the English name thus mentioned should be the very same with which a connection was established between England and Bohemia three hundred years later. Elizabeth Weston, an English lady, who married a gentleman of the emperor's court, lived in Bohemia, and wrote a volume of Latin poetry, which was published in the early years of the 17th century. The poems of the manuscript of Kralodvor, which were first published in 1819 with a German translation by Swoboda, had, at the outset, a brilliant success, which, after a temporary eclipse, they now again enjoy. The fourth edition, which was published in 1843, contains translations from it into seven different languages, including English, into which some of the ballads were rendered by Dr. (now Sir John) Bowring. A translation of the whole volume under the title of 'The Manuscript of the Queen's Court,' and under the assumption that their authenticity was unquestionable, was published at Cambridge in 1852 from the pen of Mr. Wratiaslaw. Dobrowsky, in his history of early Bohemian literature, spoke of them, at the time of their first issue, as models of purity of language, and elegance of style. A storm however was soon to burst on the head of their discoverer. In 1818 the officers of the Bohemian Museum received an anonymous letter containing the manuscript of another old poem, 'The Judgment of Libussa,' which the writer of the letter declared he had purloined from his master to save it from destruction. Dobrowsky at once pronounced the document not genuine, and afterwards characterised it as "the obvious imposture of a scoundrel who wished to play his tricks on his credulous countrymen." While he spoke thus in public, he did not hesitate in private to give it as his opinion that it was a forgery by Hanka. His judgment had such an effect, that for some time the poems were regarded by the literary circles of Bohemia in the same light as the poems of Rowley among ourselves. In 1828, a new discovery by Hanka of a manuscript of a translation of 'St. John's Gospel,' which Dobrowsky pronounced to be genuine, and which, nevertheless, contained peculiarities of language that had induced him to distrust the 'Libussa,' brought the tide to turn. Dobrowsky died in doubt in 1829. A minute investigation of the subject, made public in 1840 by Safarik and Palachy, two Bohemian historians and antiquaries of the highest reputation, led them to the belief that the 'Libussa,' and, of course, the rest, were genuine. Hanka now enjoys the reputation of having discovered in the Gospel manuscript, which is supposed to be earlier than the 10th century, the oldest specimen of the Bohemian language in existence, and in the Kralodvor manuscript relics of an early Bohemian literature which no one before him suspected to exist, and which is as superior to what followed, as the poems of Ossian to the ordinary run of Gaelic poetry.

The singular state of relations between master and pupil did not prevent Hanka from labouring with great assiduity to introduce into the Bohemian language a system of orthography, based on a plan which Dobrowsky had proposed. Many of his publications are intended to promote this alteration; but, as others have different views, the main result of the various schemes proposed appears to have been to plunge the orthography of the language for the present into a state of confusion. Hanka has also published grammars of some of the other Slavonic languages on a method suggested by Dobrowsky. He is said in the 'Oesterreichische National Encyclopädie' to be master of eighteen languages.

The latest important work of Hanka is an edition of an ancient Slavonic version of a portion of the Gospels, from a manuscript preserved at Rheims, and formerly used in the coronation of the kings of France. This manuscript, which is written in the Glagolitic character, was for a series of years a source of perplexity to the French antiquarians, who described it as written in ancient Greek or in Syriac, and to the exhibitors of the curiosities at Rheims, who occasionally described it as in Chinese. It was an English gentleman, Mr. Thomas Ford Hill, who, in the year 1789, upon being shown some Glagolitic manuscripts in the imperial library at Vienna, first observed that the

book exhibited at Rheims was in letters of the same alphabet, a remark which could not be verified for some time, as the book disappeared with the holy ampulla in the storms of the French Revolution. It was however fortunately preserved and recovered, and since its reappearance has been the object of close study and comment by Slavonic scholars. Hanka's edition was published in 1846.

In the abortive Pan-slavonic revolution of 1848, which terminated in the bombardment of Prague by Windischgrätz, Hanka does not seem to have had much share, though a very conspicuous part was taken by his friends and defenders Safarik and Palachy. He has been an active contributor to the leading Bohemian periodicals, in particular to the 'Casopis Ceskeho Muzeuma,' or 'Magazine of the Bohemian Museum,' which is issued by the institution of which he is librarian.

HA'NNIBAL, the son of Hamilcar Barca, was born B.C. 247. At the age of nine he accompanied his father to Spain, who, previous to his departure, took his son to the altar, and placing his hand on the victim, made him swear that he would never be a friend to the Romans. It does not appear how long Hannibal remained in Spain, but he was at a very early age associated with Hasdrubal, who succeeded his father in the command of the Carthaginian army in that country. On the death of Hasdrubal, B.C. 221, he obtained the undivided command of the army, and quickly conquered the Olcades, Vaccæans, Carpesians, and the other Spanish tribes that had not been subdued by Hasdrubal. The inhabitants of Saguntum, alarmed at his success, sent messengers to Rome to inform the Romans of their danger. A Roman embassy was accordingly sent to Hannibal, who was passing the winter at New Carthage, to announce to him that the independence of Saguntum was guaranteed by a treaty between the Carthaginians and Romans (concluded B.C. 226), and that they should consider any injury done to the Saguntines as a declaration of war against themselves. Hannibal however paid no regard to this remonstrance.

More than twenty years had elapsed since the termination of the first Punic war, during which period the Carthaginians had recovered their strength, and had obtained possession of the greater part of Spain; and the favourable opportunity had arrived for renewing the war with the Romans.

In B.C. 219 Hannibal took Saguntum, after a siege of eight months, and employed the winter in making preparations for the invasion of Italy. He first provided for the security of Africa and Spain by leaving an army of about 16,000 men in each country; the army in Africa consisted principally of Spanish troops, and that in Spain of Africans, under the command of his brother Hasdrubal. He had already received promise of support from the Gauls who inhabited the north of Italy, and who were anxious to deliver themselves from the Roman dominion. Having thus made every necessary preparation he set out from New Carthage late in the spring of B.C. 218, with an army of 80,000 foot and 12,000 horse. In his march from the Ebro to the Pyrenees he was opposed by a great number of the native tribes, but they were quickly defeated though with loss. Before crossing the Pyrenees he left Hanno to secure his recent conquests with a detachment from his own army of 11,000 men. He sent back the same number of Spanish troops to their own cities, and with an army now reduced to 50,000 foot and 9000 horse, he advanced to the Rhone. Meantime two Roman armies had been levied; one, commanded by the consul P. Cornelius Scipio, was intended to oppose Hannibal in Spain, and a second, under the other consul T. Sempronius, was designed for the invasion of Africa. The departure of Scipio was delayed by a revolt of the Boian and Insubrian Gauls, against whom the army was sent which had been intended for the invasion of Spain, under the command of one of the prætors. Scipio was therefore obliged to remain in Rome till a new army could be raised. When the forces were ready he sailed with them to the Rhone and anchored in the eastern mouth of the river; being persuaded that Hannibal must still be at a considerable distance from him, as the country through which he had to march was difficult, and inhabited by many warlike tribes. Hannibal however quickly surmounted all these obstacles, crossed the Rhone, though not without some opposition from the Gauls, and continued his march up the left bank of the river. Scipio did not arrive at the place where the Carthaginians had crossed the river till three days afterwards; and despairing of overtaking them, he sailed back to Italy with the intention of meeting Hannibal when he should descend from the Alps. Scipio sent his brother Cneus into Spain with the greater part of the troops to oppose Hasdrubal.

Hannibal continued his march up the Rhone till he came to the Isère. Marching along that river, he crossed the Alps (probably) by the Little St. Bernard, descended into the valley of the Dora Baltea, and followed the course of the river till he arrived in the territories of the Insubrian Gauls. The passage of Hannibal across the Alps has been a matter of much dispute. Whittaker, in a work entitled 'The Course of Hannibal over the Alps ascertained,' Lond., 1794, 2 vols. 8vo, maintains that the passage was made over the Great St. Bernard; the French writers have mostly argued for the Mont Genève, or Mont Cenis route, the latest English and German that of the Little St. Bernard. Those who wish for further information on the subject may consult 'A Dissertation on the Passage of Hannibal over the Alps,' by Wickham and Cramer, 2nd ed., Oxford; Ukert, 'Hannibal's

Zug. über die Alpen,' in vol. iv. of his 'Geographie d. Griech. u. Rom.;' and Arnold, 'Hist. of Rome,' vol. iii. pp. 83-92.

Hannibal completed his march from New Carthage to Italy in five months, during which he lost a great number of men, especially in his passage over the Alps. According to a statement engraved by his order on a column at Lacinium, in Bruttia, which Polybius saw, his army was reduced to 12,000 Africans, 8000 Spaniards, and 6000 cavalry, when he arrived in the territories of the Insubrian Gauls. After remaining some time among the Insubrians to recruit his army, he marched southward and encountered P. Cornelius Scipio on the right bank of the river Ticinus (Tesino). In the battle which ensued the Romans were defeated, and Scipio with the remainder of the army retreating along the left bank of the Po, crossed the river before Hannibal could overtake him, and encamped near Placentia. He afterwards retreated more to the south, and entrenched himself strongly on the right bank of the Trebia, where he waited for the arrival of the army under the other consul T. Sempronius. Sempronius had already crossed over into Sicily with the intention of sailing to Africa, when he was recalled to join his colleague. After the union of the two armies Sempronius determined, against the advice of Scipio, to risk another battle. The skill and fortune of Hannibal again prevailed; the Romans were entirely defeated, and the troops which survived took refuge in the fortified cities. In consequence of these victories the whole of Cisalpine Gaul (the northern part of Italy) fell into the hands of Hannibal; and the Gauls, who on his first arrival were prevented from joining him by the presence of Scipio's army in their country, now eagerly assisted him with men and supplies.

In the following year (B.C. 217) the Romans made great preparations to oppose their formidable enemy. Two new armies were levied; one was posted at Arretium, under the command of the consul Flaminius, and the other at Ariminum, under the other consul Servilius. Hannibal determined to attack Flaminius first. In his march southward through the swamps of the basin of the Arno his army suffered greatly, and he himself lost the sight of one eye, by an attack of ophthalmia. After resting his troops for a short time in the neighbourhood of Fesulae, he marched past Arretium, ravaging the country as he went, with the view of drawing out Flaminius to a battle. Flaminius, who appears to have been a rash, headstrong man, hastily followed Hannibal, and being attacked in the basin of the Lake Trasimenus, was completely defeated by the Carthaginians, who were posted on the mountains which encircled the valley. Three or four days after, Hannibal cut off a detachment of Roman cavalry, amounting to 4000 men, which had been sent by Servilius to assist his colleague.

Hannibal appears to have entertained hopes of overthrowing the Roman dominion, and to have expected that the other states of Italy would take up arms against Rome, in order to recover their independence. To conciliate the affections of the Italians, he dismissed without ransom all the prisoners whom he took in battle; and to give them an opportunity of joining his army, he marched slowly along the eastern side of the peninsula, through Umbria and Picenum, into Apulia; but he did not meet with that co-operation which he appears have expected.

After the defeat of Flaminius, Q. Fabius Maximus was appointed dictator, and a defensive system of warfare was adopted by the Romans till the end of the year.

In the following year, B.C. 216, the Romans resolved upon another battle. An army of 80,000 foot and 6000 horse was raised, which was commanded by the consuls L. Æmilius Paulus and C. Terentius Varro. The Carthaginian army now amounted to 40,000 foot and 10,000 horse. The armies were encamped in the neighbourhood of Cannæ, in Apulia. In the battle which was fought near this place the Romans were defeated with dreadful carnage, and with a loss which, as stated by Polybius, is quite incredible: the whole of the infantry engaged in the battle, amounting to 70,000, was destroyed, with the exception of 3000 men who escaped to the neighbouring cities, and also all the cavalry, with the exception of 800 belonging to the allies, and 70 that escaped with Varro. A detachment of 10,000 foot, which had been sent to surprise the Carthaginian camp, was obliged to surrender as prisoners. The consul L. Æmilius, and the two consuls of the former year, Servilius and Attilius, were also among the slain. Hannibal lost only 4000 Gauls, 1500 Africans and Spaniards, and 200 horse.

This victory placed the whole of Lower Italy in the power of Hannibal; but it was not followed by such important results as might have been expected. Hannibal, for some unexplained reason, delayed to follow up his victory, and the delay gave the Romans time to repair their loss and make preparations again to take the field against him. He probably expected a general rising of the Italian cities against the Roman tyranny. Capua and most of the cities of Campania espoused his cause, but the majority of the Italian states continued firm to Rome. The defensive system was now strictly adopted by the Romans, and Hannibal was unable to make any active exertions for the further conquest of Italy till he received a reinforcement of troops. He was in hopes of obtaining support from Philip of Macedonia and from the Syracusans, with both of whom he formed an alliance; but the Romans found means to keep Philip employed in Greece, and Syracuse was besieged and taken by Marcellus, B.C. 214-212.

In addition to this, Capua was retaken by the Romans, B.C. 211. Hannibal was therefore obliged to depend upon the Carthaginians for help, and Hasdrubal was accordingly ordered to march from Spain to his assistance.

Cneius Scipio, as already observed, was left in Spain to oppose Hasdrubal. He was afterwards joined by P. Cornelius Scipio, and the war was carried on with various success for many years, till at length the Roman army was entirely defeated by Hasdrubal, B.C. 212. Both the Scipios fell in the battle. Hasdrubal was now preparing to join his brother, but was prevented by the arrival of young P. Cornelius Scipio in Spain, B.C. 210, who quickly recovered what the Romans had lost. In B.C. 210 he took New Carthage; and it was not till B.C. 207, when the Carthaginians had lost almost all their dominions in Spain, that Hasdrubal set out to join his brother in Italy. He crossed the Alps without meeting with any opposition from the Gauls, and arrived at Placentia before the Romans were aware that he had entered Italy. After besieging this town without success, he continued his march southward; but before he could effect a junction with Hannibal he was attacked by the consuls C. Claudius Nero and M. Livius, on the banks of the Metaurus, in Umbria, his army was cut to pieces, and he himself fell in the battle. This misfortune obliged Hannibal to act on the defensive, and from this time till his departure from Italy, B.C. 203, he was confined to Bruttia; but by his superior military skill he maintained his army in a hostile country without any assistance from his government at home.

After effecting the conquest of Spain, Scipio passed over into Africa to carry the war into the enemy's country (B.C. 204). With the assistance of Masinissa, a Numidian prince, he gained two victories over the Carthaginians, who hastily recalled their great commander from Italy to defend his native state. Hannibal landed at Leptis, and advanced near Zama, five days' journey from Carthage towards the west. Here he was entirely defeated by Scipio, B.C. 202; 20,000 Carthaginians fell in the battle, and an equal number were taken prisoners. The Carthaginians were obliged to sue for peace; and thus ended the second Punic war, B.C. 201.

After the conclusion of the war Hannibal vigorously applied himself to correct the abuses which existed in the Carthaginian government. He reduced the power of the perpetual judges (as Livy, xxxiii. 46, calls them), and provided for the proper collection of the public revenue, which had been embezzled. He was supported by the people in these reforms; but he incurred the enmity of many powerful men, who traitorously turned to the Romans, and represented to them that Hannibal was endeavouring to persuade his countrymen to join Antiochus, king of Syria, in a war against them. A Roman embassy was consequently sent to Carthage to demand the punishment of Hannibal as a disturber of the public peace; but Hannibal, aware that he should not be able to resist his enemies, supported by the Roman power, escaped from the city, and sailed to Tyre. From Tyre he went to Ephesus to join Antiochus, B.C. 196, and contributed to fix him in his determination to make war against the Romans. If Hannibal's advice as to the conduct of the war had been followed, the result of the contest might have been different; but he was only employed in a subordinate command, and had no opportunity for the exertion of his great military talents. At the conclusion of this war Hannibal was obliged to seek refuge at the court of Prusias, king of Bithynia, where he remained about five years, and on one occasion obtained a victory over Eumenes, king of Pergamus. But the Romans appear to have been uneasy as long as their once formidable enemy was alive. An embassy was sent to demand him of Prusias, who being afraid of offending the Romans, agreed to give him up. To avoid falling into the hands of his ungenerous enemies, Hannibal destroyed himself by poison at Nicomedia, in Bithynia, B.C. 183, in the sixty-fifth year of his age.

The personal character of Hannibal is only known to us from the events of his public life, and even these have not been commemorated by any historian of his own country; but we cannot read the history of his campaigns, of which we have here presented a mere outline, even in the narrative of his enemies, without admiring his great abilities and courage. Polybius remarks (b. xi., p. 637, Casaubon):—"How wonderful is it that in a course of sixteen years, in which he maintained the war in Italy, he should never once dismiss his army from the field, and yet be able, like a good governor, to keep in subjection so great a multitude, and to confine them within the bounds of their duty, so that they neither mutinied against him nor quarrelled among themselves. Though his army was composed of people of various countries, of Africans, Spaniards, Gauls, Carthaginians, Italians, and Greeks—men who had different laws, different customs, and different language, and, in a word, nothing among them that was common—yet so dexterous was his management that, notwithstanding this great diversity, he forced all of them to acknowledge one authority and to yield obedience to one command; and this too he effected in the midst of very various fortune. How high as well as just an opinion must these things convey to us of his ability in war. It may be affirmed with confidence that if he had first tried his strength in the other parts of the world, and had come last to attack the Romans, he could scarcely have failed in any part of his design." (Hampton's Translation.) A good estimate of the character of Hannibal (though one which unfortunately the historian did not live to revise) will be

found in the third volume of Arnold's 'History of Rome,' which also contains by far the best account of the second Punic war in the English language.

(Polybius, b. iii., which contains the history of Hannibal's campaigns till the battle of Cannæ, and the fragments of b. vii., viii., ix., xiv., xvi.; Livy, xxi.—xxxix.; Appian; Plutarch, *Life of L. Fabius Maximus*; Nepos, *Life of Hannibal*.)

HANWAY, JONAS, born in 1712, was a Russian merchant, connected through his Russian dealings with the trade into Persia. Business having led him into that country, he published in 1753 his 'Historical Account of the British Trade over the Caspian Sea, with a Journal of Travels from London through Russia into Persia, &c.,' 4 vols. 4to, a work of no pretension to literary elegance, but containing much information on the commercial subjects of which he speaks, and on the history and manners of Persia. The latter part of his life was employed in supporting, by his pen and personal exertions, a great variety of charitable and philanthropic schemes; and he gained so high and honourable a name, that a deputation of the chief merchants of London made it their request to government that some substantial mark of public favour should be conferred on him. He was in consequence made a commissioner of the navy. The Marine Society and the Magdalen Charity, both still in existence, owe their establishment mainly to him: he was also one of the great promoters of Sunday-schools. He died in 1786. (Pugh, *Remarkable Occurrences in the Life of Jonas Hanway*.)

HARDENBERG, CHARLES AUGUSTUS, PRINCE OF, was born at Esseronda, in Hanover, on the 31st of May 1750. His family was one of the most ancient in that kingdom, and his father held a high rank in the army during the Seven Years' War. The first part of the future statesman's education was acquired at home under his father's eye. He afterwards went to the universities of Göttingen and Leipzig to continue his studies, which he completed at Wetzlar by a course of law, which in Germany as well as France is considered an indispensable part of a sound education. In this place he had the good fortune to meet with Göthe, with whom he formed a friendship which continued through life.

In 1776 he commenced a course of travel, in order to prepare himself for public life: he visited Ratisbon, Vienna, and Berlin, making some stay at each place; then passed into France, thence into Holland, and lastly into England. In 1778 he returned to Hanover, was immediately appointed to a place in a ministerial office, and the title of count was conferred upon him.

Shortly afterwards, Count de Hardenberg was sent on a diplomatic mission to London, when he acquitted himself of his trust with so much credit that he was repeatedly sent back as envoy to the British court, each time with increased reputation. He had previously married Mademoiselle de Reventlow, and for some years their union had proved a happy one, when an intrigue between her and one of the royal princes of England having been discovered, the injured husband resented the wrong in such a way as to render his removal from his post advisable. A separation from his wife took place; he withdrew to the court of Brunswick, was made a privy-councillor by the duke, and in 1787 his minister for the interior government of the duchy.

The will of Frederick the Great had been deposited in the hands of the Duke of Brunswick, upon whom therefore the duty had devolved of transmitting the document to the successor of that monarch, and this important mission was confided by the duke to Count de Hardenberg. This commission proved the introduction to his future eminence. Frederick William received him with much distinction, and in 1790 the Margrave of Anspach and Baireuth, having applied to that king to point out a man capable of administering his states, the royal favour was evinced by the strongest recommendation of Count de Hardenberg. The following year these principalities were annexed to Prussia, and the king created him minister of state, besides leaving in his hands the government of the two provinces. As soon as the war broke out with the French republic, the King of Prussia summoned him to his headquarters at Frankfurt as army-administrator, in which capacity he spent a great part of 1793 with the Prussian army on the banks of the Rhine. In 1794 he succeeded the Count de Goltz (who had died February 6) as ambassador to treat of peace with the French republic; but the appointment excited jealousy, the Prussians having suspected that as a Hanoverian he would prove too favourable to English interests.

On the 15th of April 1794 he signed the treaty of peace at Basel, and on his return to Berlin in June, Frederick William, in presence of his whole court, decorated him with his grand order of the Black Eagle. So great was his credit at this juncture, that the French Committee of Public Safety, having no orders to bestow, sent him a splendid service of Sèvres porcelain, once intended for the table of Louis XVI. From 1795 to 1802 he continued to rise in favour with the Prussian court, and the direction of the affairs of Franconia, the cabinet offices left vacant by the deaths of the ministers Werder and Heidnitz, were successively intrusted to Hardenberg. The new king, Frederick William III., who succeeded to the crown in 1797, and whose friendship for the count was equal to his father's, had long desired to intrust his chief government to this able man; but the jealousy of M. de Haugwitz, whose policy was favourable to France, prevented this arrangement for some years. At length the occupation of Hanover by

Bernadotte's corps in 1804 having driven Haugwitz from power, Count de Hardenberg was appointed to his office in August of that year.

The French troops having violated the Anspach territory, Count de Hardenberg (October 14, 1805) addressed a letter of remonstrance to Marshal Duroc, bitterly complaining of this breach of the right of nations. The firmness of the minister irritated Napoleon, who retorted by invectives published in the 'Moniteur.' Almost immediately after a convention was signed at Potsdam, between Prussia and Russia, on the 3rd of November 1805, and Frederick William III. was preparing for war, when the decisive battle of Austerlitz (December 2, 1805) compelled him to desist. The genius of Napoleon was now in the ascendant, and Prussia was forced to conclude a new treaty at Vienna on the 15th of December, by which a part of her territory was ceded to the French empire, and Northern Germany was bound to observe a neutral policy. This change of affairs deprived the count of his office, and his rival, M. de Haugwitz, was reinstated. During the seven years which followed, the progress of the war and the personal enmity of Napoleon kept him almost entirely in the background; although, in 1807, he consented to resume office for a short time, in compliance with the recommendation of the Emperor Alexander. Whilst his adopted country was overrun by the armies of Napoleon, this great statesman was forced to seek an asylum in Russia, after which he returned to Berlin, and took up his abode at Tempelhof, in the vicinity of that city.

The constant success of the British arms in Spain and Portugal, and the frequent drawn battles between the French and Russian armies, discovered to the sagacity of Count de Hardenberg that the power of Napoleon was on the decline; and in 1810 he began that system of agitation in Prussia from which he never afterwards desisted until the fall of his enemy. On the 6th of June 1810 he was created Chancellor of State. Nothing could exceed the distress to which the kingdom of Prussia at this time was reduced: her territory had been shorn; her interior was occupied by French armies; her fortresses had been seized and garrisoned by her enemies; all her military stores and magazines had been captured. Such was the unhappy condition of Prussia when Count de Hardenberg was called to direct her government, shortly before the disasters of the retreat from Moscow in 1812. This great calamity, and the immediate revolution in the power of the French empire which it entailed (both which the count had predicted), at once rendered the statesman's influence absolute in Prussia. He had passed the age of sixty when this, the most active part of his life, began. During the whole war of independence he followed the steps of Napoleon, quickening every day the animosity and vengeance of his enemies. The regiments of the Prussian armies had been reduced to mere skeletons by long reverses; they were restored by Hardenberg to the fullest state of efficiency. The public treasury was without funds; he discovered new resources, and replenished it. The spirit of the people had been enervated, and the majority were favourable to the French alliance; the count was able to reverse this feeling, and to produce that patriotism which was so conspicuous in Prussia during the last three years of the war. He signed the treaty of peace, as the representative of his sovereign, on the 3rd of June 1814, and was created a prince for his great services, receiving besides the rich domain of Newhardenberg for himself and his heirs in perpetuity. After Napoleon's abdication the prince accompanied the allied sovereigns to London, and was then sent as plenipotentiary to the congress of Vienna. In 1817 the King of Prussia entrusted to him the formation of a new government, and he became prime minister. Subsequently he attended every congress as the representative of his royal master. He reformed the system of taxation throughout every department, and regulated the disposal of the national archives. After being present at the congresses of Troppau, Laybach, and Verona, he was returning home through the north of Italy when he was taken ill at Pavia, and died at Genoa, on the 26th of November 1822, at the age of seventy-two.

It would not be easy to overrate the public services of this energetic minister, which were equally important during and after the war. He abolished the privileges of the nobles, who were exempt from many taxes on account of their rank, and made them contribute to the support of the state; he dissolved a multitude of trade corporations; he did all that he was permitted to do to unfetter trade and commerce by the removal of restrictions, and greatly improved the system of public education. The Prince of Hardenberg was married three times, but his first wife alone had issue; by her he had two sons. It is generally understood that he left behind him some valuable memoirs of his time; but William IV. having caused them to be deposited among the archives of the kingdom, they have not yet been published.

(Rabbe; *Dict. de la Conversation*; Thiers; Alison.)

HARDICANUTE, HARDECANUTE, or HARDACANUTE, was the eldest of the sons of Canute the Great, king of England, Denmark, and Norway, by Emma, styled the "Flower of Normandy," daughter of Richard I., duke of Normandy, and widow of King Ethelred II., whom he had married in 1017. [ETHELRED II.] The death of Canute, in 1035, brought forward as claimants to the inheritance of his dominions Sweyn and Harold, his two sons by Alfgiva, daughter of Alfhelm, earl of Northampton; Hardicanute, his son by

Emma; and Edward, the elder of the two sons of Emma, by her former husband Ethelred. Sweyn, who obtained the throne of Norway, made no pretensions to that of England. Edward (afterwards Edward the Confessor) and his brother were with their uncle, Duke Richard II., in Normandy. Hardicanute was also absent in Denmark, the government of which country had been some time before entrusted to him by his father. It has been supposed that Canute had intended that Hardicanute, as his eldest legitimate son, should succeed him in all his three kingdoms; it is certain that he designed him for his successor in the sovereignty of England, in conformity with a special arrangement which had been made on his marriage with Emma. Harold however had the important advantage of being on the spot at the time of his father's death, and was thus enabled to triumph over the pretensions of both his rivals. A civil war was prevented by an agreement that the authority of Hardicanute should be confined to the country to the south of the Thames, constituting the ancient kingdom of Wessex, and that all the rest of England, including London, should be resigned to Harold. Meanwhile Hardicanute remained in Denmark, leaving the government of his English province in the hands of his mother Queen Emma. This state of things subsisted till the invasion of England, in 1037, by Emma's younger son Alfred, which terminated so calamitously for himself and his followers. [EDWARD THE CONFESSOR.] On the failure of this unhappy attempt, Emma fled to the Continent, and Harold became undisputed king of all England. For the next two years Hardicanute did nothing to vindicate his rights. At last, on the repeated importunities of his mother, who had taken up her residence at Bruges, he fitted out an armament for that purpose, with nine ships of which he proceeded in the first instance to that place, to advise with her before proceeding on his enterprise. While they were together, in 1040, news was received of the death of Harold, and soon after a deputation arrived from the English nobility, offering the crown to Hardicanute, who thereupon immediately came over and assumed the government. His short reign affords scarcely any events requiring to be mentioned. His character appears to have been that of a good-natured debauchee, not wanting in generosity of sentiment, nor stained with any darker vice than the habit of inordinate eating and drinking. His plentiful table however, which was spread for a numerous company four times a day, is said to have won him the strong attachment of his thanes, who were admitted to feast along with him, however much it may have disgusted the body of the people. The chronicler John Rouse, in the end of the 15th century, writes that the anniversary of his death even then continued to be celebrated as a holiday by the people of England under the name of Hog's-tide, or Hock Wednesday. His death happened on the 8th of June 1042, in consequence of what appears to have been a stroke of apoplexy, by which he had been suddenly rendered speechless four days before, as he was about to swallow a cup of wine at the marriage feast of one of his Danish thanes, held at Lambeth, or Clapham. Hardicanute was never married, and left no issue. He was succeeded by his half-brother Edward, surnamed the Confessor.

* HARDING, JAMES DUFFIELD, was born at Deptford, Kent, in 1798. From his father, a teacher of drawing, and a pupil of Paul Sandby, he learnt to draw, but when about fifteen he received a few lessons from Prout. Like all Prout's pupils he set about imitating the subjects as well as the manner of that artist, when (as he mentions in a communication to the editor of the 'Art-Journal') his mother asked him, "Why trees, skies, and hills, God's handiwork, were not as worthy his time and attention as the objects of man's productions seemed to be?" He in consequence tried to draw the trees in Greenwich Park, and failing to satisfy himself resolved to abandon his purpose of becoming a painter. He was now placed for a while with Mr. Pye, the engraver, but after a year's trial returned to painting; worked hard from nature, till he acquired a very unusual amount of facility in sketching; learnt further from that invaluable lesson-book of the young landscape-painter, the 'Liber Studiorum' of Turner, that—as he expresses it—"if I could not bring mind as well as materials to the imitation of nature, I should do nothing;—that there was something for my philosophy to dream of, and for my eyes to see;—that in short there was something to be gained from nature beyond what is revealed to the sight." He had already attained sufficient mastery over his art to win at the age of eighteen a silver medal from the Society of Arts.

As an artist Mr. Harding is to be regarded in a twofold capacity—as a teacher of the practice and writer on the principles of art, and as a painter.

From his connections it was natural that he should look to teaching drawing, if not as a means of subsistence, at least as that which would enable him to prosecute with more ease and self-dependence his studies as an artist. But he soon broke away from the routine of teaching—the art of making (and assisting to make) pretty drawings. Himself a constant and diligent student of nature, he made it his business so to teach his pupils drawing, that they might regard it as a means to the study of nature, and an introduction to the study of the higher branches of art, rather than as an end in itself. His teaching met with great and well-deserved success. The difficulty he now found in providing examples in foliage for his pupils while acquiring a ready use of the pencil, led him to turn to the newly-

introduced art of lithography for a remedy. He soon found that to his well-practised hand, stone presented comparatively little more difficulty as a material to draw on than paper. He produced, in quick succession, a very large number of lithographic sketches and studies of trees, in every respect almost perfect fac-similes of his own pencil sketches, and not only surpassing any drawings of foliage previously provided for the use of teachers and learners, but unequalled by any which have been furnished since.

Mr. Harding, when he left off publishing these rudimentary studies, continued to practise lithography; and he was one of the first to avail himself of the facilities offered by the method of printing with two stones in tints, to produce fac-similes of elaborate studies and sketches made on tinted paper; as he was subsequently one of the first to adopt the method of working on the stone with a brush, instead of a crayon, by which still greater facility was obtained. One of the earliest works he published in this style was a series of 'Sketches at Home and Abroad,' drawn wholly by himself on stone, with great freedom and force, from his own sketches. But his most remarkable series of lithographic drawings was that termed the 'Park and the Forest,' consisting of a set of folio studies of trees, drawn with almost inimitable fidelity and brilliancy. Certainly as yet no one has at all approached Mr. Harding in the power of drawing trees with perfect truth to nature, and at the same time with brilliant artistic effect. He was the pioneer in the publication of those admirable lithographic sketches by which English artists have done so much to extend the resources of the artist, and afforded so much enjoyment to every lover of art. But Mr. Harding, not content with publishing these examples as his contribution towards general education in landscape art, has added to them a series of preceptive manuals. Of these the first was 'Elementary Art, or the Use of the Lead Pencil Advocated and Explained,' folio, 1834,—a work which has had a powerful influence in raising the character of instruction in landscape-drawing throughout the country. Other and improved editions of this work have been since published, and it has been followed by a still more elaborate work on 'The Principles and Practices of Art: Composition, Light and Shade,' &c. He has also published some elementary 'Lessons on Trees,' &c.

As an artist Mr. Harding became known to the public by his water-colour pictures, and for a long series of years his works formed a prominent and attractive feature in the exhibitions of the Old Society of Painters in Water-Colours. In this branch of art also Mr. Harding struck out a line for himself. Girtin, Turner, Prout, and the early water-colour painters, generally produced their effects by repeated washes of transparent colour. Harding—perhaps not the first to introduce the method, but the first to carry it to a great extent,—produced his by the free use of body-colour, using transparent colour with or over it. Many doubted, and some still doubt, whether the practice is really an improvement upon the earlier method, or whether indeed it be a 'legitimate' practice at all; but Mr. Harding held any method to be legitimate by which he could produce the effect he desired, and there can be no doubt that in his hands the process was a most effective one. It was speedily adopted by the principal water-colour painters, both in figure and landscape. Some ten or twelve years ago Mr. Harding directed his attention chiefly to painting in oil, and he carried into this branch all the firmness of touch and facility of execution which had characterised his water-colour pictures. He now became a candidate for admission into the Royal Academy, but even for candidature, that body requires the applicant to be a member of no other art-society in the metropolis: Mr. Harding consequently severed his long-standing connection with the Society of Painters in Water-Colours—to their no small mutual loss. But the Royal Academicians have continued to refuse him admittance amongst them, although their landscape strength has been greatly weakened; and Mr. Harding is, beyond dispute, by far the most accomplished and varied, if not actually the best, of the landscape painters who exhibit on the walls of the Royal Academy, without being of the 'forty.' Wearied of waiting, apparently, Mr. Harding has lately rejoined the Water-Colour Society.

The landscapes of Mr. Harding are exceedingly numerous, and include a very wide range of subjects and scenery; Great Britain, France, the Rhine, the Tyrol, the Alps, Italy, and Germany, all have in turn been laid under contribution, and the range of subjects includes sea and land, mountains and plains, palaces and rustic cottages. All of course are not of equal excellence, but few painters have tried so many varieties, and succeeded so well in each. It has been and with justice objected, that he too seldom attains that highest art in which the art itself is concealed, but it is to be remembered that Mr. Harding has, by his writings as well as in his verbal instruction, laid open his own principles of effect, and thus rendered easy the detection of those artifices, which by the uninitiated are unknown and unsuspected. But the true objection to his works—that which prevents them from taking their place among the highest efforts of the landscape art—is, that he has not wrenched "that something from Nature beyond what is revealed to sight," which he saw at the outset of his artist life it was the true task of the artist to accomplish. It would seem as though the very facility of drawing which Mr. Harding possesses, whilst it has given him almost unrivalled power as a landscape sketcher, has interfered with his perfect success as a landscape painter; by leading him in the preliminary study to

rest content with a rapid sketch in which the broad features of the scene are caught at once, instead of dwelling upon the scene till the inner sentiment—the poetry hidden from the hasty glance—reveals itself. His extraordinary manipulative dexterity, as well as rapidity of perception, there can be little doubt has stood in the way of the development of this mental character—the sentiment of the landscape—wanting which true grandeur, or poetic refinement, can never be reached, whatever the character of the scene, or the power and fidelity with which it is depicted.

HARDINGE, HENRY, VISCOUNT, third son of the late Rev. Henry Hardinge, rector of Stanhope, in the county of Durham, by Frances, daughter of James Best, Esq., of Chatham, was born at Wrotham, Kent, on the 30th of March 1785. He was member of a family which has long been located at King's Newton Hall, Derbyshire, and is said to have originally come from Denmark.

Having spent a short time at Eton, Henry Hardinge was gazetted ensign in a regiment of foot, October 8, 1798, obtained his lieutenantcy in 1802, and captaincy in 1804. It was his good fortune early to attract the notice of the Duke of Wellington, then Sir Arthur Wellesley, under whom he served throughout the whole of the Peninsular War, and for a considerable time was upon the staff of the commander-in-chief; he was also for nearly the entire period deputy-quarter-master-general of the Portuguese army. He was present at the battles of Roleia and Vimiera, where he was severely wounded; at the battle of Corunna he was by the side of the gallant Sir John Moore when he received his fatal wound. After having lost his friend at Corunna, he was present at the passage of the Douro, the battle of Busaco, the lines of Torres Vedras, and the battle of Albuera. In this engagement he displayed the greatest skill, courage, and self-command; it was a hard-fought field; and to the change in the fortunes of that day, effected as it was by the persevering valour of the British infantry, Lord Hardinge often pointed back in after life as having encouraged him as a general to persevere through every obstacle, and to place perfect confidence in the enduring valour of British troops. After this we find him side by side with Lord Wellington in almost every engagement of the war. He took part in the first and second sieges of Badajoz, at Salamanca, and at Vittoria, where he was again severely wounded, and also at Pampeluna, at the battles of the Pyrenees, and at Nivelle, Nive, and Orthea. When he returned to England after the close of the Peninsular war, he was justly regarded as one of the most gallant officers in the service. Upon the renewal of hostilities he was again in arms, and took an active part in the campaign of 1815 under the Duke of Wellington, upon whose staff he then was serving. Two days before the battle of Waterloo he was employed as brigadier-general with the Prussian army at Ligny, where, in a skirmish with the enemy, he was wounded in the left arm, which had to be immediately amputated, and prevented him from taking a personal part in that glorious victory. He was however rewarded with the dignity of a K.C.B. on the enlargement of the order of the Bath in the same year, and with a pension of 300*l.* a year for the loss of his hand.

When, upon the resignation of Lord Goderich, in 1828, the Duke of Wellington undertook the construction of a ministry, he chose Sir Henry Hardinge (who had been returned as member for Durham in 1820 and again in 1826), to succeed Lord Palmerston as secretary at war. He was sworn a member of the privy council, and two years later exchanged this position for that of the chief secretaryship for Ireland, under the late Duke of Northumberland as lord lieutenant. Here however he did not remain long: the duke's ministry retired from office in the autumn of the same year, and Sir Henry Hardinge returned to England. He resumed his high post however under the short-lived ministry of the late Sir Robert Peel, which lasted from November 1834 to April 1835. From this time till the return of Sir Robert Peel to power in September 1841, Sir Henry Hardinge remained in opposition. At the latter date he returned to Ireland as chief secretary under Earl de Grey, where he remained until 1844.

Towards the close of the year 1843 events arose in India to which we need not allude further than to say, that the directors of the East India Company thought that the time had come when it was necessary for them to recall Lord Ellenborough from the high post of governor-general of India. It was stated by Sir Robert Peel in his place in the House of Commons, that while the East India House and the Home Government were at issue as to the propriety of this step, they were quite of one mind as to the selection of his successor; and that when the premier recommended Sir Henry for the vacant post, on the ground of his great experience of civil matters, his high personal character, and his military eminence, the chairman of the company answered that his own choice had already fixed upon the same individual.

In April 1844 he accordingly undertook the government of India, and was sworn into office on landing at Calcutta in the July following. On his arrival he found the vast territories under British rule enjoying the most profound peace. The disasters of the Affghan campaign had been avenged; Sir Charles Napier had reduced the amers of Scinde at Meeanee and Hyderabad; Scinde itself had been annexed to our dominions; and the Mahratta war had been terminated by the submission of the Durbar at Gwalior. The governor-general had therefore ample time to make himself master of very many details of government, in which he was not slow to perceive that considerable reforms

were needed. Able and indefatigable in his efforts, he did his best to bring about a better feeling and a more friendly footing than had hitherto prevailed between the services; he admitted the claims of the natives to many privileges; he promoted a stricter discipline among the troops in general; he lent his powerful aid to the organisation of those Indian railways which have since been carried out with such marked success under his successor Lord Dalhousie; and in short, he did all that was in his power to promote the welfare of the community at large.

But the course of Indian events was not long destined to flow on in peace. A storm of war and bloodshed was gathering in the north; and Sir Henry Hardinge, with all his precaution, could not have foreseen or avoided the events which awaited him. The death of Runjeet Sing, 'the Lion of Lahore,' had paved the way for an infinity of plottings and intrigues in the capital of the Punjaub. With the death of the Lion, it seemed that the controlling power had left Lahore; the young maharajah, Dhuleep Sing, a child of four years old, was, together with his mother, in the hands of the Sikh soldiery, who were wearied with domestic faction, and clamoured to be led out against their English neighbours. Active preparations were made by the Sikhs for crossing the Sutlej; but long before the public had any idea of what was going on Sir Henry Hardinge was on the alert, and had quietly concentrated a force of 32,000 men and 68 guns round Ferozepore, Loodianah, and Umballa. The governor-general reached the latter place about the middle of December, and, proceeding to Loodianah, inspected the various cantonments, and made himself acquainted with the actual position of affairs. He at once moved up the whole of his force from Umballa; and on the 13th, learning that a large Sikh force had crossed the Sutlej River, he issued a proclamation against the hostile invasion. On the 17th the Sikhs advanced, and partly entrenched themselves within strong earthworks at Ferozeshah, while the other part encamped near Moodkee, opposite Ferozepore. The combined operations of the British cavalry under Brigadiers Gough, White, and Mactier, and of the infantry under Sir Harry Smith, Sir J. McCaskill, and General Gilbert, drove back the Sikhs from their well-contested position, and won the glorious victory of Moodkee—a victory too dearly purchased by the death of Sir Robert Sale. On the 22nd the attack was renewed at Ferozeshah; but night came on before the victory could be completed, and some Sikh guns were being brought to bear with deadly aim upon the British columns, when the governor-general mounted his horse, and at the head of the 80th regiment, and a portion of the Bengal 1st Europeans, carried the guns at a charge and spiked them. The next day the Sikh entrenchments were carried by the bayonet, the enemy's guns were captured, and the invaders re-crossed the Sutlej. The want of cavalry alone prevented Sir Hugh Gough from following the enemy into their country and marching on Lahore. There is something truly touching in the fact that, in this important battle, Sir Henry Hardinge, though he held the supreme civil authority in India, offered his services to Sir Hugh Gough as second in command, and took an active part in the eventful scenes of this and the following day, directing the left wing of the army throughout. The Sikhs, again defeated at Sobraon and Aliwal, were forced to sue for terms; and the treaty of Lahore, concluded by Sir Henry Hardinge, exhibits him in the light of a moderate and magnanimous conqueror. He exacted from the Sikhs the whole expense of the war, and left a British garrison, under the late Sir John Littler, in Lahore, the capital of the Punjaub, for the protection of the maharajah's authority. This country—a healthy, well watered, and fertile region—was subsequently annexed to our dominions by the Marquis of Dalhousie. On the ratification of this treaty, Sir Henry Hardinge received the thanks of both Houses of Parliament, together with a pension of 3000*l.* a year, and was also advanced to the peerage as Viscount Hardinge of Lahore. The East India Company also conferred on him a further pension of 5000*l.* a year; and the city of London voted him their freedom. In January 1848 he was superseded in his Indian government by Lord Dalhousie. Though originally of Tory principles, after his elevation to the peerage Lord Hardinge rarely spoke or busied himself in the House of Lords on any measures except those of military interest. On Lord Derby's advent to power, in February 1852, Lord Hardinge again took office as master-general of the ordnance, and succeeded to the post of commander-in-chief, on the death of the Duke of Wellington, in the September following. He was promoted to the dignity of a G.C.B. in 1844, and obtained the colonelcy of the 57th Foot in 1843. Among foreign orders, he received those of the Red Eagle of Prussia, Wilhelm of the Netherlands, the Tower and Sword of Portugal, and that of San Fernando of Spain. He also received a cross and five clasps for his Peninsular services, and was present in no less than sixteen general actions for which medals were granted. He was promoted to the rank of a Field-Marshal on the 2nd of October 1855. He resigned the office of commander-in-chief, in consequence of a paralytic seizure, in July 1856. In the administration of the Horse Guards, as a veteran disciple of the Duke of Wellington, Lord Hardinge trode most carefully and religiously in his Grace's steps. In 1821 he married the Lady Emily Jane Stewart, daughter of Robert, first marquis of Londonderry, and widow of John James, Esq., by whom he had an only daughter and two sons. The younger son, Arthur, now captain and lieutenant in the Coldstream Guards, was aide-de-camp to his father in the battles on the Sutlej, and was also present at the Alma.

His lordship died September 24, 1856, and was succeeded by his eldest son, Charles Stewart, born in 1822, who had been private secretary to his father while governor-general of India.

HARDOUIN, JOHN, commonly called PÈRE HARDOUIN, was born of obscure parents, at Quimper in Brittany, in 1647. He entered the society of the Jesuits at an early age, and devoted himself to the study of belles-lettres, the learned languages, history, philosophy, and divinity. A large portion of his life was spent in undertaking to prove, chiefly from medals, that the greater part of those writings which are considered as ancient, both classical and of the early Christian age, were forged by monks of the 13th century. He excepted only the works of Cicero, Pliny's 'Natural History,' Virgil's 'Georgics,' and Horace's 'Satires and Epistles.' These he supposed to be the only genuine works of antiquity remaining, except a few inscriptions and fasti; and that from these the monks had drawn up and published Terence's Plays, Livy's and Tacitus's Histories, Virgil's Æneid, Horace's Odes, &c. (See his 'Chronologia ex Nummis Antiquis restituta: Prolusio, de Nummis Herodiadum,' 4to, Paris, 1693.) His opinions upon religious subjects were not less wild than those upon profane learning.

The Society of Jesuits at last interfered, and Hardouin, in 1708, published the recantation of his fancies.

His edition of Pliny's 'Natural History,' prepared for the use of the dauphin, was published at first in 5 vols. 4to, Paris, 1685; republished with great improvements in 3 vols. folio, Paris, 1723, with a more copious Index than had up to that period been appended to any classic. In 1715 he edited a new edition of 'The Councils,' printed at the royal press in 12 vols. folio.

Père Hardouin died at Paris on the 3rd of September 1729. After his death a volume of his 'Opuscula,' in folio, was published by an anonymous friend.

* HARDWICK, PHILIP, R.A., architect, was born in June 1792, in the parish of St. Marylebone, London. His father, Mr. Thomas Hardwick, an architect of some note, had been a pupil of Sir William Chambers, and built the church of St. Marylebone, commenced in the year 1813: he died in January 1829. Philip Hardwick received his general education at the school of the Rev. Dr. Barrow, in Soho-square, and entered the office of his father at an early age, where he pursued his professional studies with considerable assiduity. In 1816, at the age of twenty-four, he was elected to the office of architect to the hospitals of Bridewell and Bethlehem, succeeding Mr. James Lewis, who in the previous year had completed the buildings (since altered) in St. George's Fields. This appointment Mr. Hardwick retained during twenty years, when he relinquished it from a pressure of other engagements. In 1818 and 1819 he visited France and Italy. In 1825, on the formation of the St. Katherine's Dock Company, Mr. Hardwick was appointed their architect: he designed and superintended the erection of their large warehouses and other buildings (Mr. Telford being the engineer for the Docks); and he had also been concerned in the numerous compensation cases which arose in clearing away the houses which thickly covered the site. In 1827 Mr. Hardwick was elected by the governors of St. Bartholomew's Hospital to succeed his father as architect to that institution—an appointment which he has resigned only in the present year (1856) in favour of his son. In 1829, on the decease of Mr. Charles Beazley, he was elected architect to the Goldsmiths' Company, and soon after his appointment was required to make the designs for a new hall: these being decided upon, he superintended the erection of the present building, the exterior being completed in 1832, and the building being opened with a banquet on the 15th of July 1835. In the year 1832 he also completed for the same Company, the Grammar School at Stockport, Lancashire, which is in the Tudor-gothic style. After this time Mr. Hardwick carried on a large practice. Amongst his works, was the entrance to the Euston Station of the London and Birmingham Railway, remarkable for the great scale of the Grecian-Doric order, which he has there employed. In 1841 he was applied to by the benchers of Lincoln's Inn to design the New Hall and Library. In this work Mr. Hardwick was greatly assisted by his son, having during the period of its progress been attacked by a severe illness, from which he has since hardly recovered. With his other appointments, he has held the office of architect to Greenwich Hospital, in which he succeeded the late Mr. Kaya. He was architect to the late Duke of Wellington during many years to the time of his death, and in his professional capacity followed the hero to his grave. He was elected an Associate of the Royal Academy in November 1839, and in February 1841 became a Royal Academician. He has received the royal gold medal from the Institute of British Architects, of which body he is a fellow, and has held the office of vice-president; he also received one of the gold medals at the Paris Exhibition of 1855, and has been a fellow of the Royal Society since the year 1828.

* PHILIP CHARLES HARDWICK, the son of Mr. Philip Hardwick, referred to above, has himself designed and superintended many important buildings during the last few years, both in the Italian and Gothic styles of architecture. He was a pupil of Mr. Edward Blore, but, having gone to his father in 1841, or 1842, soon after this time he was engaged upon the designs of most of their joint productions. His own principal London work is the Great Western Hotel at Paddington; and the recent additions to the London and North-

Western Euston Station were designed by him. His last work is a riding-house at Knightsbridge, for the Duke of Wellington.

HARDWICKE, PHILIP YORKE, FIRST EARL OF, was the son of an attorney at Dover, where he was born on the 1st of December 1690. His father was in very indifferent circumstances, and wholly unable to afford him the education generally bestowed upon young men in his station of life. The great abilities of the son enabled him however to surmount all difficulties. He was a great favourite with Mr. Samuel Morland, a man of considerable learning, who kept a school at Bethnal Green, at which he was placed for a short time. When removed to the office of Mr. Salkeld, an eminent solicitor in London, his diligence and talents won the respect and esteem of that gentleman also. So steady was his perseverance, and so rapid his progress in the knowledge of the law, that Mr. Salkeld caused him to be entered of the Middle Temple in November 1708, as a preparatory step to his call to the bar. During the time he was keeping his terms he became acquainted with Mr. Parker, one of the sons of Lord Chief-Justice Macclesfield, the consequence of which was an introduction to Lord Macclesfield, who highly appreciated Yorke's merits, and employed him as the companion and tutor of his sons. To this fortunate acquaintance the rapid and extraordinary success of Mr. Yorke at the bar is mainly attributable. In May 1715 he was called to the bar, when the support of his old benefactor Salkeld, who was in very extensive practice as a solicitor, together with the favour and patronage of Lord Macclesfield, enabled him at the very outset to acquire an extensive practice: indeed the favouritism of Lord Macclesfield, even in court, justly offended and aggrieved many old and eminent practitioners.

The elevation of Lord Macclesfield to the woolsack (1719) enabled him further to promote the interests of his favourite, and accordingly, through his interference, in the same year Yorke took his seat in the House of Commons as member for Lewes, the whole expenses of his election being defrayed by the ministry. In the same year he married Mrs. Lygon, a young widow, the daughter of Mr. Cocks, a gentleman of good estate in Worcestershire, and the niece of Lord Somers and Sir Joseph Jekyl, then master of the rolls.

In March 1720, while upon the circuit, and within five years after his call to the bar, he was, through the influence of his patron the chancellor, appointed solicitor-general. This step was a very hazardous one; for besides the professional jealousy which was perhaps not unjustly excited towards him, he had to contend with the doubts felt by all parties whether so young a man could be possessed of sufficient learning and experience to discharge the duties of a leading counsel. The talents however which he displayed in the conduct of the business in which he was employed soon made it evident that he was fully equal to the duties of his new station. Shortly after his appointment he was knighted; and in 1724 he was made attorney-general. It was after this period that his patron, Lord Macclesfield, was impeached for gross corruption in office, and Sir Philip Yorke had great difficulty in procuring himself to be excused from the task of assisting the managers of the Commons in making good their charge. In 1733, having held the office of attorney-general nearly ten years, he was appointed Lord Chief-Justice of the King's Bench, and created Baron Hardwicke. He presided in the King's Bench for three years and a half, during which period he added largely to his former high reputation. On the death of Lord Chancellor Talbot (1737) he was raised to the dignity of lord chancellor. It is upon his judgments as chancellor that the reputation of Lord Hardwicke is principally founded; he held the great seal during nearly twenty years, dispensing justice throughout that period with the most consummate skill at a time when the principles of equity jurisdiction were by no means in a settled state. His integrity was never called in question; the wisdom of his decrees was the theme of universal eulogy, and it is a remarkable fact that, during the whole time that he presided in the Court of Chancery, three only of his judgments were appealed from, and those were confirmed by the House of Lords. In 1754 he was created Earl of Hardwicke and Viscount Royston. He continued to hold the great seal until the 19th of November 1756; the Duke of Newcastle having resigned the premiership on the 11th. After his retirement from public life, Lord Hardwicke divided his time between his seat at Wimpole in Cambridgeshire and his house in Grosvenor-square, enjoying unimpaired his vigorous intellect until nearly the close of his seventy-third year, when he was attacked by a disorder which proved fatal on the 6th of March 1764. The labours of Lord Hardwicke's mind are recorded in his legal judgments. They are preserved, so far as the points decided by them, in the reports of Atkyns and Vesey, sen., and in a volume published from Lord Hardwicke's own notes by Mr. West. Some notes of his decisions have also been made public by Mr. Lee. These volumes however do not give any notion of the language in which the judgments were delivered. Few specimens of his style of writing remain. A short treatise, 'A Discourse of the Judicial Authority of the Master of the Rolls,' has been attributed to him, and some few letters have been preserved by Dr. Birch. It has also been said that he was the author of the paper in the 'Spectator' for the 28th of April 1712, signed Philip Homebred; but this statement is exceedingly doubtful.

* HARDY, PETER, one of the most distinguished living actuaries, and a member of the Royal Society, was born in Jamaica and educated

in England. His father was an officer in the Royal Artillery, who died in the year 1814, very shortly after his birth. Mr. Hardy is one of those to whom we are more especially indebted for the application of the purely mathematical sciences to the practical affairs of life. In connection with other important undertakings, he drew out the tables for various life-assurance companies, and has written several works on the theory of insurance; but that which has rendered his name more generally known, is the publication of a new system of notation as applied to the contingencies of life-assurance, in which he appears as a rival to Professor De Morgan and Mr. Milne. In the year 1847 he took an active part in the formation, and became vice-president, of the Institute of Actuaries, an association for the purpose of elevating the status of the profession, and of educating the young members in mathematical and statistical learning essential to the business of life-assurance.

HARDYNG, JOHN, one of our old historians, descended of a respectable northern family, was born in 1378, and at the early age of twelve was admitted into the family of Sir Henry Percy, eldest son of the Earl of Northumberland, known by the name of Hotspur, with whom he fought as a volunteer at the battles of Homildon and Cokelawa. After the death of his patron, whom he accompanied in the fight of Shrewsbury, as soon as a pardon had been proclaimed for the adherents of the Percys, Hardyng enlisted under the banner of Sir Robert Umfravile, who was connected with the Percys by affinity, and under whom in 1405 he became constable of the castle of Warkworth in Northumberland. How long he remained at Warkworth is unknown, but his knowledge of Scottish geography seems soon to have engaged him in the secret service of his country. The exact time when Hardyng was first sent to obtain restitution of the deeds of homage, which had been given up by Mortimer in the minority of Edward III., does not appear, but it must have been early in the reign of Henry V. He remained in Scotland three years and a half, indefatigable in the research, and obtained some at the hazard of his life. In 1415 we find him, with Sir Robert Umfravile, attendant on the king at Harfleur. His journal of the march which preceded the memorable battle of Agincourt forms one of the most curious passages in his 'Chronicle.' In 1416 he accompanied the Duke of Bedford to the sea-fight at the mouth of the Seine.

An obscure notice in a rubric of the Lansdowne manuscript of Hardyng's 'Chronicle' intimates that he was at Rome in 1424. Soon after we find him again employed in ascertaining the fealty due from the Scottish kings. In one or two passages of his 'Chronicle' he distinctly alludes to an incurable injury received, as he himself expresses it, for England's right; and in one or two others he states the offer of a thousand marks which had been made to him by King James I. of Scotland, on condition of his embezzling some of the earlier instruments he had procured. The letter of protection from King James, making this offer, is still preserved among the ancient deeds in the Chapter-House at Westminster. In another passage of his 'Chronicle,' as well as in an address to King Henry VI., Hardyng mentions 450 marks as the price for which he obtained some other of the deeds of homage. Notwithstanding these declarations however, several writers have considered our author as a dexterous and notable forger, who manufactured the deeds for which he sought reward. The spurious instruments by which King David II. and King Robert II. were made to acknowledge the superiority of England appear principally to have occasioned this strong charge of fabrication; but whether Hardyng in his zeal for his country became the tool of some more powerful person, or was imposed upon in the purchase of the deeds, cannot now be thoroughly ascertained.

Actively as Hardyng was engaged in life, he seems to have been constantly employed in gathering materials for his 'Chronicle,' the first composition of which he finished toward the latter end of the minority of Henry VI. The Lansdowne manuscript already referred to closes with the life of Sir Robert Umfravile, who died January 27th 1436, under whom Hardyng seems to have lived, in his latter years, as constable of Kyme Castle in Lincolnshire.

Of the rewards which Hardyng appears to have received, the first was in the 18th Henry VI., when he had a grant for life of 10*l.* per annum out of the manor or alien preceptory of Wyloughton, in the county of Lincoln. In the 19th Henry VI. a confirmation of the grant occurs for seven years, with the further grant after that time of the reversion of the manor for life. In 1467 he received a pension of 20*l.* a year for life, charged in the patent-roll upon the revenues of the county of Lincoln.

The evening of Hardyng's days was passed in the entire recomposition of his work for Richard, duke of York, father to King Edward IV., who fell in the battle of Wakefield, December 31st 1460. It was afterwards presented to King Edward IV. himself. The history comes no lower than the flight of Henry VI. to Scotland; but, from a passage in which the queen is mentioned, it is evident that he could not have finished his work before 1465. How long he survived its completion is unknown, but he must then have been at least eighty-seven years of age.

The Chronicle of Jhon Hardyng, in Metre, from the first begynnynge of Englande unto the reigne of Edwarde the Fourth, was printed by Grafton in 1543; to which Grafton added a continuation to the 34th Henry VIII., a small thick quarto; and it is not a little singular that there should be two editions of this work, both printed in the same

month of the same year, January 1543, differing in almost every page, and one, in Grafton's own portion, containing twenty-nine pages more than the other. A collation of both, together with that of a valuable manuscript of Hardyng, was published by the booksellers of London in 1812, under the care of Sir Henry Ellis.

The present printed text of Hardyng's 'Chronicle' is from the recomposition presented to Edward IV. The 'Chronicle,' as written for Henry VI., the only manuscript known of which is preserved in the Lansdowne Collection in the British Museum, has never been printed. It differs in every page from the printed copy. Hearne had intended its publication. Several manuscripts of the later text of Hardyng's 'Chronicle' are extant: one in the Harleian Collection, No. 661; one in Selden's; another in the Doucean Collection in the Bodleian; and one in the Ashmolean Library at Oxford. A sixth manuscript was formerly preserved in the library of Basil, earl of Denbigh.

HARE, JULIUS CHARLES, a distinguished English divine and controversialist, was born in 1796, and was one of the sons of the Rev. Robert Hare, rector of Hurstmonceaux and vicar of Ninfield in Sussex, who was the son of Dr. Francis Hare, bishop of Chichester. He was educated at Trinity College, Cambridge; was a fellow of the College; and graduated B.A. 1816, and M.A. 1819. In 1832 he was instituted to the rectory of Hurstmonceaux (a living belonging to his family); in 1840 he was appointed Archdeacon of Lewes; in 1851 he became one of the prebendaries of Chichester; and in 1853 he was nominated one of her Majesty's chaplains. He died at Hurstmonceaux on the 23rd of January 1855. Such are the principal external facts in the life of a man whose personal influence in his day was very great, and who has besides left some contributions to our literature. His first literary appearance of any note was in 1827 when, in conjunction with a younger brother (the Rev. Augustus William Hare, M.A. of New College, Oxford, and rector of Alton Barnes, Wiltshire, who died in 1834), he published a volume of miscellaneous thoughts and observations entitled 'Guesses at Truth, by Two Brothers.' (Subsequent and enlarged editions of this work have been published; and also a 'Second Series' under the same title). In 1828, in conjunction with the Rev. C. Thirlwall, afterwards bishop of St. David's, Mr. Hare appeared as translator of 'Niebuhr's History of Rome,' from the German. Of his subsequent publications, the following are the more important:—'The Children of Light: a Sermon,' 1828; 'A Vindication of Niebuhr's History of Rome from the charges of the Quarterly Review,' 1829; 'Sermons preached before the University of Cambridge,' 1839; 'The Victory of Faith, and other Sermons,' 1840; 'The Better Prospects of the Church: a Charge to the Clergy of the Archdeaconry of Lewes,' 1840; 'The Unity of the Church: a Sermon,' 1845; 'The Mission of the Comforter, and other Sermons,' 2 vols., 1846; 'The Means of Unity: a Charge,' 1847; 'A Letter to the Dean of Chichester on the Agitation excited by the appointment of Dr. Hampden to the See of Hereford,' 1848; 'The Duty of the Church in Times of Trial: a Charge,' 1848; 'The True Remedy for the Evils of the Age: a Charge,' 1849; 'Education the necessity of Mankind: a Sermon,' 1851; 'The Contest with Rome: a Charge,' 1852; 'Vindication of Luther against his recent English assailants (H. Hallam, Esq., J. H. Newman, W. G. Ward, and Sir William Hamilton), 1854. From this list it will be seen that Archdeacon Hare's chief activity was in theological literature and ecclesiastical controversy. In the church he was regarded, along with his friend Mr. Maurice, as being at the head of what has been called "the broad party," as distinct from either the "high" or the "low." The liberality of his opinions in philosophy and his tolerance of religious differences, may be inferred from the fact of his having been the intimate friend of the late John Sterling, whose remains he edited, with a long and affectionate memoir in 1848. It was Mr. Carlyle's dissatisfaction with his memoir, as an account of his friend, that led him to write his 'Life of Sterling.' Mr. Hare's memory is held in high veneration, not only by those who regarded him as an ecclesiastical leader, but also by many who had learnt to respect him as an earnest thinker on social and philosophic subjects.

HARINGTON, SIR JOHN, was born at Kelston near Bath, in the year 1561. His mother was a natural daughter of Henry VIII., and his father held an office in the court of that monarch. This pair having on one occasion shown great fidelity to the princess (afterwards queen) Elizabeth, she manifested her gratitude by standing godmother to their son John. She was afterwards wont to speak of him as "that witty fellow, my godson," or "that merry poet, my godson," or in some such way.

Having been educated at Eton and at Christ's College, Cambridge, and having afterwards for a short time made a pretence of studying law, he, by means of his wit and many accomplishments, gained the notice of Queen Elizabeth, and became a member of her court. He had exercised his wit, on one occasion, in translating a tale out of Ariosto's 'Orlando Furioso,' (the story of Giascondo, in the twenty-eighth book), and he circulated this among the ladies of the court, who were greatly pleased with it. When the queen saw it, we are told that she affected great indignation at the indelicacy of some passages, and, by way of punishment, forbade Harington the court until he had translated the whole poem. This he accomplished in 1591, and dedicated it to the queen.

When the Earl of Essex was appointed Lord Lieutenant of Ireland

in 1599, Harington was made a commander of horse under Lord Southampton, in his service. When Essex shortly after made his precipitate return to England, Harington was one of the few officers whom he chose to accompany him, and he came in for a share of the queen's indignation. She was angry also, we are told, that Essex had, in Ireland, conferred on Harington the honour of knighthood. "I came to court," writes Harington to one of his friends, "in the very heat and height of all displeasures; after I had been there but an hour, I was threatened with the Fleet; I answered poetically that 'coming so late from the land-service, I hoped that I should not be pressed to serve in her majesty's fleet in Fleet Street.' After three days every man wondered to see me at liberty." But the queen shortly relented, and then, writes Sir John in the true style of a courtier, "I seemed to myself, for the time, like St. Paul, rapt up in the third heaven, where he heard words not to be uttered by men." On the accession of James I. in 1602, Harington continued in possession of royal favour. He now wrote for the private use of Prince Henry his 'Brief View of the State of the Church,' which is an account of the bishops who lived in the reigns of Elizabeth and James I. He died in 1612.

Besides the translation of the 'Orlando Furioso' and the 'Brief View of the State of the Church,' which have been mentioned, Sir John Harington wrote a satirical poem entitled the 'Metamorphoses of Ajax,' a volume of epigrams, and several occasional pieces in verse, several of which remain unpublished. His epigrams and letters, many of which are preserved in Harington's 'Nugæ Antiquæ,' show him to have been a man of wit and taste; and the 'View of the State of the Church' is pleasantly written.

HARLES, GOTTLIEB (or THEOPHILUS) CHRISTOPHER, a learned and laborious German philologist, was born at Culmbach in 1738, died November 2, 1815. He held several academical offices in the university of Erlangen, and published many editions of Greek and Latin authors, which however are not highly esteemed. His character is that of a laborious student rather than of a judicious and able critic. His best works are his 'Introductions to the History of the Greek and of the Latin Language;' and his 'Lives of the Most Eminent Philologists of our age,' a very useful collection to those who are concerned with literary biography, 1770, 3 vols. 12mo, Breme. The most important of his publications is an edition of the 'Bibliotheca Græca' of Fabricius, Hamburg, 1790-1811, in 12 vols. 4to, which contains great additions, and a new arrangement of the original matter [FABRICIUS, J. A.]

HARLEY, ROBERT, EARL OF OXFORD, was born in London in 1661, of a family long of distinguished note in the county of Hereford. His grandfather, Sir Robert Harley, was master of the mint in the reign of Charles I., and his father, Sir Edward, was governor of Dunkerque after the Restoration. In the troubles of the 17th century the Harleys acted with the Presbyterian party, of which the family was considered one of the heads, and although both Sir Robert and his son Sir Edward took the field on the side of the parliament in the early part of the civil war, they went into opposition when the republicans obtained the ascendancy, and Sir Edward afterwards took an active part in bringing about the Restoration. The subject of the present article entered parliament after the Revolution as member for Tregony, and afterwards sat for Radnor, professing for some time the whig principles of his family. After a transition period however, in which he followed a course that perplexed and successively excited the expectations of all parties, he went fairly over to the Tories, and soon became one of their most active and efficient combatants in the House of Commons. In the House which met under the tory administration of Rochester and Godolphin, in February 1701, Harley was elected speaker by a great majority; and even in the next parliament, which assembled in December of the same year, although his friends now appeared in diminished numbers, they were still strong enough to place him again in the chair. He was a third time chosen to the same office by Queen Anne's first parliament, in October 1702, and retained it till April 1704, when he was made secretary of state. He is believed to have been principally indebted for this promotion to the good offices of Miss Abigail Hill, who had been introduced into the royal household by her cousin Sarah, duchess of Marlborough, and who was by this time beginning to supplant her patroness in the queen's favour. Miss Hill's father, it seems, a merchant in the city, who had fallen into distressed circumstances, was as near a relation of Harley as her mother was of the duchess; and this circumstance had probably something to do in bringing him and the daughter together. According to the scandalous chronicle of the Duchess of Marlborough, Miss Hill, having fixed her affections on Mr. Masham, the queen's page, applied to her cousin Harley for his aid in forwarding her object: by Harley's management she became Mrs. Masham; and in return she exerted all her influence to attach the weak mind of the queen to Harley and his friends. It is certain that from this time she and Harley acted in confederacy against the Marlborough interest. In this state of things the latter party began to seek a new support by inclining towards the Whigs; and various circumstances chanced for the moment to favour this line of policy. In the parliament which met in October 1705, the Whigs were stronger than they had been since the beginning of the reign; this sufficed to introduce into the cabinet two distinguished

members of that party, William Cowper, Esq. (afterwards Lord Cowper), as lord chancellor, and Charles, earl of Sunderland, the son-in-law of Marlborough, as one of the secretaries of state. But the struggle was finally decided against Harley by the public suspicion and odium to which he became exposed in consequence of the conviction of one of his clerks named Gregg, for carrying on a treasonable correspondence with France. Gregg, who was executed for his crime, left a paper with the sheriff, in which he entirely exculpated Harley: even this however did not allay the outcry against the latter; it was said that he himself was the writer of the paper, which he had induced Gregg to sign and to deliver by the promise of a reprieve. On the other hand, Harley's friends asserted that the strongest endeavours were made by the opposite party to suborn Gregg, and to prevail upon him, by the promise of a pardon, to accuse Harley. In the beginning of February 1708, after the conviction, but before the execution, of Gregg, the Duke of Marlborough and Lord Godolphin intimated to the queen that unless Harley were removed, they would leave her service; on this, although it is believed that the queen was herself willing to incur the threatened risk of continuing to support him, the secretary resigned, along with his friend St. John (afterwards Lord Bolingbroke). Harley remained out of power for about two years and a half; at the end of which time the Whig ministry was partly undermined by his intrigues and those of Mrs. Masham, partly destroyed by its own imprudence and over-confidence. In August 1710 Godolphin was dismissed, and Harley was appointed chancellor of the Exchequer, all the other Whig members of the cabinet having at the same time resigned or been turned out, and Tories put in their places. A new parliament was soon after called, which completely sanctioned this arrangement; so inflamed was the temper of the public mind against the late ministry, that only about a hundred of their friends were returned from all England. The Duke and Duchess of Marlborough, and all their connections, were now completely discarded both from office and from the queen's favour, which continued to the end of her life to be wholly engrossed by Mrs. Masham (whose husband was soon after made a peer), and by those to whom she lent her influence and protection.

On the 8th of March 1711 an accident happened to Harley which in the end proved very serviceable to his schemes of ambition: a French emigrant, who called himself the Marquis de Guiscard (he was in fact an abbé, and brother of the Count de Guiscard), having been apprehended on a charge of high treason and brought for examination to the cockpit, suddenly seized a penknife and struck at the minister. Harley's wound was very slight, but he took care to remain as long as possible in the surgeon's hands. In May following he was appointed lord high treasurer, being about the same time created Earl of Oxford and Earl Mortimer, and invested with the Order of the Garter. As the victories of Marlborough constituted the glory of the Godolphin administration, the peace of Utrecht, concluded May 5th 1713, is the event for which that of Harley is chiefly memorable. It was after this that the jealousy between the premier and Bolingbroke assumed the character of an open rivalry, although it is believed to have been fermenting in secret for years before. The ambitious and intriguing dispositions of the men, both it is probable equally unprincipled, made it impossible that they should long continue to act together after their one common object, the achievement of peace with France, ceased to unite their efforts. Bolingbroke had now the art to gain the favourite, Lady Masham, whose influence Harley, on the other hand, seems to have erroneously calculated that he was by this time sufficiently established to despise. It was soon proved that he was wrong: on the 27th of July 1714 the lord treasurer received his dismissal. It is said that a few days before he had excited the determined vengeance of Lady Masham by demurring to a grant of an annuity of 1500*l.* a year which she had obtained from the queen. The queen's death, three days after, put an end for ever to the political existence of both Oxford and Bolingbroke. In August 1715 both were impeached by the House of Commons. When St. John made his escape to France, Harley was committed to the Tower, and there he lay for nearly two years. At last, in June 1717, he was on his own petition brought to trial before the House of Lords; but the Commons not appearing to prosecute their impeachment, the prisoner was on the 1st of July acquitted and discharged. During his confinement the Earl of Oxford wrote to James offering his services, and, after his acquittal, we find from the Stuart papers that he was consulted by James and by some of the leading Jacobites; and at one time James appears to have desired that his affairs should be placed under the direction of a single head instead of a council, and he expressed his wish that Lord Oxford should assume that office: but nothing further appears to have been done in the matter. Henceforth the Earl of Oxford lived in retirement till his death, May 21st 1724. He was succeeded in his titles and estates by Edward, his eldest son by his first marriage with Elizabeth, daughter of Thomas Foley, Esq., whose brother was made Baron Foley in 1711, being one of the twelve peers then introduced in a body into the House of Lords.

Lord Oxford showed his attachment to literature both by his patronage of Swift, Pope, and others, and by the extensive and valuable library of printed books and manuscripts which he spared no pains or expense to collect; the manuscripts were purchased by parliament (26th of Geo. IV.) and now form the well-known Harleian collection in the

British Museum. His own writings do not show much literary talent. They are, a Letter to Swift on Correcting and Improving the English Tongue; an Essay on Public Credit; an Essay on Loans; and a Vindication of the Rights of the Commons of England. He has given an account of his own administration in a letter to the queen, written a few days before his dismissal, which is printed in Tindal's History and elsewhere. On this subject also may be consulted the Duchess of Marlborough's Account of her own Life, and the anonymous reply to that work by James Ralph, entitled 'The Other Side of the Question' (8vo, London, 1742), many of the materials of which had evidently been supplied by the Oxford family. The proceedings on the trial of Lord Oxford are in the 'State Trials.'

HARLOW, GEORGE HENRY, was born in London in 1787. He was the only son of his parents; his father, who was a merchant, died while he was an infant, and he was brought up by his mother, who watched with interest and anxiety the early development of her son's talent for drawing. He was educated for a few years at Westminster School, but when about sixteen he was placed with a Flemish landscape-painter of the name of De Cort, whom he left for Mr. Drummond, A.R.A., the portrait-painter; and he was finally placed in the studio of Sir Thomas (then Mr.) Lawrence, in Greek Street, with the privilege of copying pictures there from nine until four o'clock, but with an especial proviso that he should receive "no instruction of any kind;" for this privilege he paid one hundred guineas per annum. At the expiration however of a year and a half the master and pupil quarrelled. Lawrence used to employ Harlow to dead-colour, and Harlow had so far a share in painting a much-admired dog in a portrait of Mrs. Angerstein that, at the Angerstein's, he had the imprudence to claim it as his own. This came of course to the ears of Lawrence, who in consequence dismissed his pupil. Harlow has the credit of having revenged Lawrence's resentment by painting a caricature of his style upon a sign-board at Epsom, in one corner of which he wrote, 'T. L., Greek Street, Solo.'

Harlow however had perhaps no great need of such assistance or instruction as he would be likely to obtain from Lawrence; he possessed a fine feeling for colour, a tolerably correct eye for form, and great facility of execution, especially in portraiture in small, whether in pencil, crayons, or oil-colours. He never studied at the Royal Academy: he professed to consider study in schools and academies as so much time spent in the destruction of originality. His first picture of note was 'Hubert and Prince Arthur,' but he painted few historical pieces; the most celebrated of them is the 'Trial of Queen Catherine,' of which the principal characters were portraits of the Kemble family; Mrs. Siddons as Queen Catherine. Harlow painted many portraits, of which the best is certainly that of Fuseli, a work in every respect of great merit, painted for Mr. Knowles, Fuseli's biographer. The portraits of Northcote and Nollekens are also among his best works.

Having already obtained a considerable reputation and some means, Harlow set out in June 1818 upon a visit to Rome, where he attracted great notice and excited some wonderment by completing an effective copy of the 'Transfiguration,' by Raffaele, in eighteen days. Canova was much pleased with it, and told Harlow that it looked like the work of eighteen weeks; he exhibited one of Harlow's pictures at his house, and it procured him his election as a member of the Academy of St. Luke, where it was also exhibited. Harlow before he left London was a candidate for the degree of associate in the Royal Academy, but he had only one vote, that of Fuseli. He died in London on the 4th of February 1819 in the thirty-second year of his age, and shortly after his return from Italy. He was elected a member of the Academy of Florence on his passage home through that city. His biographers describe him as having been frivolous in character and prodigal in his habits: he was however little more than a youth when he died.

HARMER, THOMAS, a protestant Dissenting minister, was born at Norwich, in 1715, of pious parents. He received his education under the care of Mr. Eames in London, and was ordained in his twentieth year as the minister of the Independent church of Watesfield in Suffolk. In this place he continued till his death in 1788, "beloved by all and useful to many."

The work by which Harmer is principally known is his 'Observations on various passages of Scripture, placing them in a new light; compiled from relations incidentally mentioned in Books of Voyages and Travels into the East.' By the interest of Dr. Lowth, bishop of London, who warmly approved of the work, Harmer obtained the manuscript papers of Chardin, which furnished him with a variety of curious additions to his work. The last and best edition was published, with a memoir prefixed, by Dr. Adam Clarke, in 1816, in 4 vols. 8vo. Harmer was also the author of 'An Account of the Jewish Doctrine of the Resurrection of the Dead,' and of 'Outlines of a New Commentary on the Book of Solomon's Song,' 8vo, 1763, 2nd edition, 1775.

HARMODIUS. [ARISTOGRON.]

HAROLD I., surnamed Harefoot, was the younger of the two sons of Canute the Great, by his mistress, or, according to others, his first wife Alfiva. On the death of his father in 1035, Harold disputed the possession of the English crown with his half-brother Hardicanute, whom their father had designed for his successor, and succeeded in acquiring the sovereignty of London and all the country to the north of the Thames. [HARDICANUTE.] In 1037 the Thanes and people of Wessex also submitted to him, on which he was crowned king of all England, although it is stated that Egelnoth, the archbishop of Canter-

bury, at first refused either to perform the ceremony himself or to permit any of his brother bishops to officiate in his stead. No events of the reign of Harold, after he became sole king, have been preserved, except that of the murder by his suggestion or command of Alfred, son of Ethelred, who had landed in England with a view to the prosecution of his claim to the English crown. Even the character of Harold may be said to be unknown—some of the chroniclers representing him as a friend to the church, others as not even professing a belief in Christianity. He died in 1040, and was succeeded by his brother Hardicanute. The common account of his surname of Harefoot is that it was given him for his swiftness in running; it is said that, in his favourite amusement of the chase, he used often to pursue the game on foot. According to Brompton, it refers merely to his general preference of walking to riding—a most unbecoming taste, says that annalist, for a king. Another explanation is that his foot was hairy.

HAROLD II. was the second of the sons of Godwin, earl of Kent. This Godwin, or Gudin, makes his first appearance in English history in the reign of Canute, and appears to have been born a few years before the close of the 10th century. He was undoubtedly of Saxon descent. The English writers call him the son of Wulfnoth, a 'child' (which may perhaps mean a peasant) of Sussex. One writer, Radulphus Niger (whose manuscript chronicle is in the British Museum), says distinctly that he was the son of a cowherd ('filius bubulci'). These statements are consistent, so far as they go, with a curious account which Mr. Turner has translated from the Knytlinga Saga, and which represents Godwin to have been the son of a peasant named Ulfadr (evidently the same name with Wulfnoth), and to have owed his introduction at the court of Canute to a service which he performed to Ulf, one of the noble captains of that Danish conqueror, who, having lost himself in a wood after the battle of Skorstein, or Seorstan [EDMUND II.], accidentally met with Godwin driving his father's cattle, and was by him conducted in safety first to the cottage of Ulfadr and then to the camp of Canute. This story however makes Ulfadr to have had an uncle Edric who had already raised himself from the same humble station to be duke or chief governor of Mercia. Godwin's talents and address, his handsome person and fluent speech, speedily enabled him to make his way at court. In course of time he married Gyda, or Githa, the sister of Ulf, who was himself married to a sister of Canute; and on this Canute made him a jarl, or earl. Earl Godwin's first appearance in political history is after the death of Canute, as a supporter, in concert with Queen Emma, of the succession of Hardicanute. [HARDICANUTE.] On this occasion, as in the general course of his after-life, he attached himself to the Saxon, in opposition to the Danish or other foreign interest. It seems improbable therefore that he should soon after this have been a party, as the historians after the Norman Conquest all-give, to the treacherous murder of Prince Alfred, the younger brother of Edward the Confessor. [EDWARD THE CONFESSOR.] The common story indeed affirms that Godwin in this instance acted again in concert with Queen Emma; but, besides the extreme unlikelihood that the mother should thus plot the destruction of her own child, whose death was, at the moment at least, to benefit nobody except Harold Harefoot, the enemy of herself and of her families by both her husbands, the actual immediate result of this murder was her own exile as a fugitive, and the complete overthrow, for the time, of whatever power she or her son Hardicanute, for whom she was acting, possessed in England. The contemporary author, it may be further observed, of the 'Encomium Emmae,' addressed to her, and written by her orders, never would have made the murder, as he does, one of the subjects of his detail, if there had been the least suspicion of her participation in it. If Emma was innocent, Godwin, who was and had all along been her associate in governing Wessex for Hardicanute, was in all probability equally so. It is true that a few years after, in the reign of Hardicanute, he was, in a quarrel with Alfric, archbishop of York, passionately accused by that prelate of having been the instrument through whom the murder was effected; but he immediately met the charge by demanding to be put upon his trial, and the result was his complete acquittal. When Alfred and his followers were fallen upon by the soldiers of Harold, they were under the protection of Godwin, who had met them on their landing, having, as he asserted, been sent by Emma to be their conductor; this circumstance seems to have formed the sole ground for an imputation which pursued him to the grave, and after his death was eagerly taken up by the Norman historians, when everything that could blacken the characters of Godwin and his family was grateful to the reigning dynasty. After the accession of Hardicanute, Godwin was employed in conjunction with Archbishop Alfric to disinter the body of Harold Harefoot, and see the fragments thrown into the Thames. It was a disagreement arising out of this barbarous commission that gave occasion to the quarrel between the archbishop and the earl. The history of Godwin and his family during the next reign has been sketched in the notice of Edward the Confessor. The historians after the Conquest assert that his death, which certainly happened in consequence of a sudden seizure of illness as he sat at the royal table on Easter Monday, 1053, was occasioned by his being choked in attempting to swallow a piece of bread, which, in reply to an observation of the king obliquely hinting that he had been the murderer

of Prince Alfred, he had wished might stick in his throat if there was any truth in the charge. The story, which was unknown to the contemporary annalists, is of a kind too well adapted to the credulous superstition of the age in which its first relaters lived, as well as to their interests and prejudices, to leave much doubt as to its origin. At the time of his death Godwin was the most powerful subject in England, he and his sons dividing among them the government of a large portion of the kingdom, while his only daughter was the wife of the king. His eldest son, Sweyn, indeed, after having been repeatedly pardoned for resistance to the royal authority and other crimes, had died abroad a short time before the death of his father. On Godwin's death his earldom of Kent, which besides that county comprehended all Wæsex and Sussex, was given to his second son, Harold; Harold's own earldom, under which were included the counties of Essex, Middlesex, Huntingdon, Cambridge, and the rest of the ancient kingdom of East Anglia, being at the same time transferred to Alfgar, the son of Leofric, styled Earl of Leicester, the potent rival of the Godwin family. This latter arrangement was not tamely submitted to by Harold: Alfgar was outlawed by the witenagemot on a charge of treason which Harold brought against him; on which, flying to Ireland, he speedily returned with a force of Danes from that country, and of auxiliaries from Wales, to levy open war against the Saxon king. Harold was despatched by Edward to meet the rebels; but a contest of arms was prevented by a negotiation which restored the earldom to Alfgar, who soon after also succeeded to the honours and estates of his father Leofric, but did not live above a year to enjoy them. Harold meanwhile, as the king's commander-in-chief, turned to chastise the Welsh for the aid they had given to the revolt; and a series of hostilities with that people commenced which did not finally terminate until in 1063, after Harold had twice carried fire and sword through their country, they sent him the head of their Prince Griffith, in token of their entire submission. It was about two years after this that Harold was shipwrecked on the coast of Ponthieu, where he was immediately seized by the Earl Guy, and on the demand of William, duke of Normandy (afterwards king of England), delivered over to that prince. William did not permit his prisoner to embark for England till he had compelled him to take a solemn oath, in presence of the assembled Norman barons, that he would do everything in his power, on the decease of Edward, to promote the duke's succession to the English crown. It would appear to have been already well understood, or at least generally suspected, that the English earl looked to this prize for himself. Immediately after he returned home, Harold found himself involved in a new affair of difficulty. This was the insurrection of the people of Northumberland against his younger brother Tostig, who a few years before had been appointed their earl on the death of the great Siward, but whose misgovernment and savage excesses of despotism had at length become insupportable. The insurgents had placed at their head Morcar, the eldest of the two sons of the recently-deceased Earl Alfgar; and he and his brother Edwin had come to their assistance with the men of Lincoln, Nottingham, Derby, and Leicester, and also a body of Welsh auxiliaries. Harold, who was sent to meet them, either deemed their force too formidable or their demands too just, to be resisted; it was agreed, without coming to blows, that the earldom should be taken from Tostig and given to Morcar. On this Tostig retired to Bruges, brooding, as it presently appeared, on schemes of vengeance. The death of Edward the Confessor (January 5th 1066) followed in little more than a month after this pacification, which had been perhaps the more readily accorded by Harold in consequence of the near prospect of that event: he was at hand when it took place. On the evening of the same day, a report having been circulated that Edward had named him for his successor before he breathed his last, he was proclaimed king in an assembly of the thanes and of the citizens of London, held in the cathedral of St. Paul's. The next day he was solemnly crowned in the same place, a few hours after the interment of the late king.

For more than half a year Harold was left to occupy the throne he had thus obtained in quiet. His accession evidently took place with the general assent of the nation; the nobility with few exceptions, and the bishops with scarcely any, avowed themselves its authors and supporters; the acquiescence of the people was complete everywhere, except, for a brief space at first, among the Northumbrians, who were, however, easily induced to lay aside their scruples by the influence of their Earl Morcar, whose sister Editha Harold had married; and on the whole there is no reason to suppose that he would have had any trouble in maintaining himself if he had been allowed to remain unmolested by attacks from abroad. Two foreign enemies however at length assailed him nearly at the same time. His brother Tostig, having formed a confederacy with Harold Hardrada, king of Norway, first made a descent upon the Isle of Wight, and after he had levied contributions from the inhabitants, sailed round at the head of his fleet of sixty vessels to the mouth of the Tyne, where he was joined about the beginning of September by Hardrada with a navy of three hundred sail. The invaders had driven back Earls Morcar and Edwin, and made themselves masters of the entire province of York before Harold came up. On the 26th of September 1066 however he engaged them at Stamford Bridge, on the Derwent, when both Hardrada and Tostig fell, and the English king obtained a complete victory. Only

three days after this the Duke of Normandy landed at Bulverhithe, between Pevensey and Hastings, on the southern coast, with a mighty armament, which he had spent the preceding eight months in fitting out. Harold, having first proceeded to London, did not reach the Norman camp till the 13th of October 1066. On the morning of the following day battle was joined at a place then called Senlac (now Battle), about nine miles from Hastings. The issue of this memorable engagement, which lasted the whole day, was the complete defeat and rout of the English, after Harold himself had fallen, pierced through the head by an arrow—his two brothers, Gurth and Leofwine, having also been already slain. This victory, as all know, gave the crown of England to the Duke of Normandy, by whose descendants it has ever since been worn.

Harold is said to have been twice married. By his first wife, whose name has not been preserved, he had three sons, Edmund, Godwin, and Magnus, who on the death of their father fled to Ireland, from which they afterwards attempted some descents on the western coasts of England, but eventually retired to Denmark. His second wife, Editha, otherwise called Alghitha, the daughter of Earl Alfgar, is said to have been the widow of Griffith, the Welsh prince, whose head had been sent by his subjects as a peace-offering to Harold. By her Harold is asserted to have had a son and two daughters; but, as it is admitted that he was only married to her some time in 1065 at the earliest, we may doubt if she could already have produced so considerable a family. The son, named Wolf, is said to have been knighted by William Rufus; Gunilda, the eldest daughter, became blind, and passed her life in a nunnery; the second, whose name is unknown, is supposed to have gone to Denmark with her half-brothers. Queen Editha survived her husband many years, during which she is said to have lived in obscurity in Westminster. This lady, according to the Scottish historians, was the mother by her first husband of a daughter who married Fleance, the son of Banquo, thane of Lochaber, whose son Walter, marrying a daughter of Alan the Red, earl of Brittany, became the progenitor of the Stewarts. (On this story see Appendix No. X. to the first volume of Hailes's 'Annals of Scotland'.)

HARPALUS. [DEMOSTHENEÆ.]

HARPE, JEAN-FRANÇOIS DE LA, was born at Paris in 1739, and educated at the College d'Harcourt. He here unfortunately undertook the correction of a pasquinade against one of his instructors, and was accordingly suspected of being its author, and also the author of another which was directed against the tutor who had been his greatest benefactor. In consequence he was imprisoned for nine months in the Bastille. In 1762 he published a collection of juvenile poems. He was fortunate with a tragedy called 'Warwick,' which he produced in the following year, but less so with two others entitled 'Pharamond' and 'Timoleon.' It was about this time that his acquaintance with Voltaire commenced. He now began to write éloges for the Académie, and those of Henry IV., Fenelon, and Racine were highly commended. His poems and dramas, excepting 'Warwick,' and his translations from Sophocles, made comparatively small impression. He afterwards published his 'Lycée, ou Cours de la Littérature,' his 'Mémoires Littéraires,' and a satirical work called 'Correspondence Turque.' At the commencement of the Revolution he was a zealous republican; but the imprisonment which he suffered from the democrats changed his politics, and he became a warm defender of the church and the monarchy. He was bold enough at the first sittings of the 'Lycée des Arts' to inveigh against the Terrorists, and he would have suffered from their vengeance if he had not escaped by flight. After the 16th Brumaire (9th of November 1799), he began anew his lectures at the Lycée. Shortly before his death his freedom of speech offended the first consul, and he was banished to Orléans. He returned to Paris soon afterwards, and died in 1803.

The reputation of La Harpe rests on his 'Lycée,' which is a very valuable work to the student of French literature, of which it gives a complete history from its commencement to the author's own time. The criticisms on the different writers are not founded on principles acknowledged by the English, but perhaps the value of the book is on that account greater, as it exhibits the object of the French authors, and the standard according to which they are to be judged when compared with each other. The philological remarks also are serviceable in instructing the reader in the niceties of the language. The part relating to ancient literature is of little value.

HARPOCRATION, VALERIUS, a Greek rhetorician of Alexandria. We have no particulars of his life, nor of the time in which he lived. He wrote a 'Lexicon to the Ten Orators,' which contains an account of many of the persons and facts mentioned in the orations of the ten principal orators of Athens, and also an explanation of many words and phrases in their writings; the work is particularly valuable on account of the information it contains respecting the public and civil law of Athens, and also for its historical and antiquarian information.

The 'Lexicon' was first printed by Aldus in 1503, with the scholia of Ulpian on the Philippic orations of Demosthenes. The first critical edition was that of Massac, 4to, Paris, 1614, with many notes and a commentary; it was reprinted by Blancard, with a Latin translation, Leyden, 1633, 4to; and by Gronovius, 4to, 1696. Later and improved editions are those of W. Dindorf, Leipzig, 1824, 2 vols. 8vo; Bekker, 8vo, Berlin, 1833. Suidas mentions another work of Harpocration,

entitled 'A Collection of Flowery Extracts,' which has not come down to us.

HARRINGTON, JAMES, descended from an ancient and noble family in Rutlandshire, and the eldest son of Sir Sapcotes Harrington, was born in January 1611. He entered as a gentleman-commoner at Trinity College, Oxford, in 1629, and had there the advantage of Dr. Chillingworth's instructions. At the close of his residence at the university, during which his father had died, he set out on a course of travels; and going first to Holland, resided for some time at the Hague, where he lived on terms of familiarity with the Queen of Bohemia, daughter of James I., who was then a fugitive in Holland, and with the Prince of Orange. With the latter he visited the court of Denmark; and the Prince of Orange subsequently confided to Harrington the management of all his affairs in England. From Holland he proceeded to France and Italy.

On his return to England, Harrington principally passed his time in retirement, cultivating the family affections and pursuing his studies in political science. But in 1646 he was requested by the commissioners whom parliament had appointed to carry king Charles I. from Newcastle nearer to London, to undertake the task of waiting on his majesty, as being personally known to him, and as being no partisan. He complied with the request, and the manner in which he performed the task having pleased the king, he was shortly after made a groom of the bedchamber. The king now became much attached to him. "His majesty loved his company," says Anthony Wood, "and finding him to be an ingenious man, chose rather to converse with him than with others of his chamber. They had often discourses concerning government; but when they happened to talk of a commonwealth, the king seemed not to endure it." On the king's removal from the Isle of Wight to Hurst Castle, Harrington, who had offended the parliament commissioners at Newport, was removed from the king's service, and on his subsequently refusing to swear that he would not assist or conceal the king's escape, he was placed under arrest, and detained until an application of General Ireton obtained him his liberty. He afterwards showed his attachment to the king by accompanying him to the scaffold.

"After the king's death," says Mr. Toland, "he was observed to keep much in his library, and more retired than usually, which was by his friends a long time attributed to melancholy or discontent." He was engaged however in the composition of his 'Oceana.' And when he had proceeded some way in its composition, making no secret of his views on government and of his partiality towards a commonwealth, he found that he had already brought down upon himself the suspicions both of Cromwell and of the Royalists. His book was seized, while in the press, by Cromwell's order. Harrington, having failed in other attempts to recover the book, bethought himself at last of an application to Lady Claypole, Cromwell's favourite daughter, who was personally unknown to him, but of whose affability and kindness he had heard much. Being ushered into her room, he found there at first only a child of three years old. "He entertained the child so divertingly, that she suffered him to take her up in his arms till her mother came; whereupon he, stepping towards her and setting the child down at her feet, said, 'Madam, 'tis well you are come at this nick of time, or I had certainly stolen this pretty little lady.' 'Stolen her,' replied the mother, 'pray what to do with her! for she is yet too young to become your mistress.' 'Madam,' said he, 'though her charms assure her of a more considerable conquest, yet I must confess it is not love but revenge that prompted me to commit this theft.' 'Lord,' answered the lady again, 'what injury have I done you that you should steal my child?' 'None at all,' replied he, 'but that you might be induced to prevail with your father to do me justice, by restoring my child that he has stolen.' But she urging that it was impossible, because her father had children enough of his own, he told her at last it was the issue of his brain which was misrepresented to the Protector, and taken out of the press by his order." Harrington's wit fascinated the lady, and through her intercession he succeeded. Cromwell afterwards read the book, which, according to promise, had been dedicated to him, and professed to admire it.

The 'Oceana' on its appearance excited great attention. Answers were published, and those Harrington in turn answered. Richard Baxter's 'Holy Commonwealth' was written principally against the 'Oceana;' but so far was this work from gratifying the party for whose favour it was designed, that in 1683 it was publicly burnt by a decree of the University of Oxford, together with some of the writings of Hobbes and Milton, and other works, among which however the 'Oceana' was not included. In 1659 Harrington published an abridgment of the 'Oceana,' under the title of the 'Art of Law-giving;' and he subsequently published several tracts, many of which are quite of a temporary nature, and the others devoted more or less to the same subject as the 'Oceana.' He had also founded a club, called the Rota Club, at which he gave nightly discourses on the advantage of a commonwealth and of the ballot. The club was broken up after the Restoration. But the members of the club had become marked men.

On the 28th of December 1661, he was seized by order of the king on a charge of treasonable designs and practices, and was carried to the Tower. He was at first ignorant of the precise charge against him; but on a private examination taken by Lord Lauderdale, Sir

George Carteret, and Sir Edward Walker, it came out that he was suspected of having taken part in a conspiracy to subvert the monarchy and establish a commonwealth. He stoutly denied all cognizance of the proceedings which those gentlemen with great show of circumstance and detail attributed to him; but his denial was set down, it appears, to faithfulness to an oath. He subsequently presented through his sisters several petitions to the king, praying that he might either be released from confinement or brought to a public trial. Having received no answer to his petitions he made application for a Habeas Corpus: and shortly after this had been granted he was removed without previous notice, and without any communication being made to his friends, to a rock opposite Plymouth, called St. Nicholas's Island. His close confinement here soon produced an effect upon his health, and upon petition he was allowed to be removed to Plymouth. Shortly after he became deranged, owing, as has been suggested, to a medicine recommended to him for the cure of the scurvy, but more probably from the effect of his severe imprisonment. Lord Bath, the governor of Plymouth, then made intercession with the king, and Harrington was released. On being removed to London, and obtaining the best medical advice, he rallied considerably as regards bodily health, but his mind was never again right. At his advanced age, and in this unsatisfactory state of health, he married. He died of palsy on the 11th of September 1677, in the sixty-seventh year of his age.

The 'Oceana,' which is Harrington's chief work, is an imaginary account of the construction of a commonwealth in a country of which Oceana is the imaginary name. It opens with an exposition of the grounds and arguments for a commonwealth; and the principles which are there established are afterwards sought to be applied in detail. Harrington lays great stress on a doctrine which he enunciates thus: that dominion follows the balance of property; by which he means that the form of government in a state must depend on the mode in which property is distributed therein. Proceeding on this doctrine, he requires what he calls an equal Agrarian law as the foundation of his commonwealth. Its other chief features are popular election of councillors by ballot, and the going out at certain periods of a certain number of these councillors, which is also managed by ballot.

HARRIOT, THOMAS, an eminent mathematician and astronomer, was born at Oxford in the year 1560. He took his degree of Bachelor of Arts in 1579, and in 1584 he accompanied Sir Walter Raleigh in his expedition to Virginia, where he was employed in surveying and mapping the country, and upon his return to England in 1588 he published his 'Report of the New found land of Virginia, the commodities there found to be raised, &c.' Harriot was introduced by Sir Walter Raleigh to the Earl of Northumberland, whose zeal for the promotion of science had led him to maintain several learned men of the day, such as Robert Hues, Walter Warner, and Nathaniel Torporley. This enlightened nobleman received Harriot into his house, and settled on him an annual salary of 300*l.*, which he enjoyed to the time of his death, in July 1621. His body was interred in St. Christopher's Church, London, and a monument erected to his memory, which, with the church itself, was destroyed by the great fire of 1666. During his lifetime Harriot was known to the world merely as an eminent algebraist; but from a paper by Zach in the 'Astronomical Ephemeris' of the Royal Academy of Sciences at Berlin for the year 1788, it appears that he was equally deserving of eminence as an astronomer. The paper referred to contains an account of the manuscripts found by Zach at the seat of the Earl of Egremont, to whom they had descended from the Earl of Northumberland. From it we learn that Harriot carried on a correspondence with Kepler concerning the rainbow; that he had discovered the solar spots prior to any mention having been made of them by Galileo, Scheiner, or Phrysius: also that the satellites of Jupiter were observed by him January 16, 1610, but their first discovery is generally attributed to Galileo, who states that he had observed them on the 7th of that month. A correspondence with Kepler on various optical and other subjects is printed among the letters of Kepler. Ten years after Harriot's death his Algebra, entitled 'Artis Analyticae Praxis, ad Equationes Algebraicas nova, expedita, et Generali Methodo, resolvendas,' was published by his friend Walter Warner. It is with reference to this particular work that Des Cartes was accused of plagiarism by Wallis, whose admiration of its author was so high, that he could not even see the discoveries of Vieta anywhere but in the 'Praxis' of Harriot. This charge however has sunk with time, though the French writers still continue to answer it. The geometry of Des Cartes appeared in 1637, six years after the publication of Harriot's Algebra. (Hutton, *Dictionary; Mathematical Tracts*, vol. ii., &c.; Montucla, *Histoire des Mathématiques*, tom. ii., p. 105.)

HARRIS, JAMES, born July 20, 1709, was the eldest son of James Harris, Esq., of Salisbury, by the Lady Eliz. Ashley Cooper, sister of Lord Shaftesbury, the author of the 'Characteristics.' He was educated at the grammar-school in his native place, and passed thence to Wadham College, Oxford. In his twenty-fifth year he lost his father, and thereby became independent in fortune, and able to devote his time to studies more congenial to his taste than the law, in which he had been engaged. For fourteen years of his life he did little else than study the Greek and Latin authors with the greatest diligence, and his works show how deeply imbued he was with their spirit. In

1745 he married the daughter of John Clarke, Esq., of Sandford, near Bridgewater, by whom he had five children. In 1761 he was returned for Christchurch, which seat he retained till his death. In 1762 he was appointed to the post of a lord of the Admiralty, and next year to that of a lord of the Treasury, which he held for two years, when his party went out of office. In 1774 he became secretary and comptroller to the queen. He died in 1780.

Harris is best known by his 'Hermes, or a Philosophical Inquiry concerning Language and Universal Grammar,' a work which Lowth, with abundant extravagance, characterised as one of the most beautiful pieces of analysis which had appeared since the days of Aristotle. The real merit of this work of Harris is perhaps best expressed in the following few words from the first sentence of his sensible preface: "The chief end proposed by the author of this treatise in making it public has been to excite his readers to curiosity and inquiry." A careful perusal of the treatise cannot fail to make a man think more accurately, though he may, as he ought to do, reject some of the writer's premises, and consequently many of his conclusions.

Harris's 'Hermes' was published in 1751. Some years before, he had written three treatises, on Art, on Music, Painting, and Poetry, and on Happiness; and in 1775 he published his 'Philosophical Arrangements,' a part of a large work on the Aristotelian Logic. His last work is called 'Philological Enquiries;' it does not however answer to its title, as it is in fact a history of literature subjoined to dissertations on criticism. It is considerably interlarded with quotations from the authors of antiquity, but not nearly to such an extent as his other works.

His private character appears to have been excellent, and his son's [MALMESBURY, EARL OF] admiration for him proves that his moral nature was so perfect as to secure the respect of those who had the best opportunity of judging it.

HARRIS. [MALMESBURY, EARL OF.]

HARRIS, JOHN, D.D., born about 1667, died September 7, 1719, a voluminous writer, in the list of whose works we find numbers of sermons, treatises on algebra and fluxions, geometry, trigonometry, astronomy, and navigation. He also wrote 'Remarks on some late papers relating to the Universal Deluge and the Nat. Hist. of the Earth;' 'Navigantium atq. Itinerantium Bibliotheca, or a complete collection of Voyages and Travels,' &c., 1705, 2 vols., fol., reprinted with additions and corrections in 1744 and 1764; 'Lexicon Technologicum, or an Universal English Dictionary of the Arts and Sciences, explaining not only the terms of Arts, but the Arts themselves,' 2 vols., fol., 1704-10. From this, says Watt, "have originated all the other dictionaries of arts and science and cyclopedias that have since appeared;" and it is as the originator of this important and useful class of works that his memory best deserves to be preserved. 'History of Kent,' 2 vols. fol., 1719. Harris was secretary and vice-president of the Royal Society, and possessed considerable church preferment, but was reduced to poverty by neglect of his affairs. He died in want, and was buried at the expense of his friends.

*HARRIS, JOHN, D.D., Principal of New College, St. John's Wood, the chief seminary of instruction for the ministry amongst the English Independents, is a native of Ugborough, in Devonshire, where he was born in 1804. In his twentieth year he became a student at Hoxton Independent College, and after completing his course of study for the ministry, accepted an invitation to be pastor of the Independent Church at Epsom. Though esteemed as a pastor, and popular as a preacher, it was chiefly by his writings that Mr. Harris became known to the public. His first production, 'The Great Teacher,' was very favourably received; but the work by which he acquired most fame was entitled 'Mammon, or Covetousness the sin of the Christian Church,' written in competition for a prize of 100 guineas offered by Dr. Conquest of London. Mr. Harris's essay was the successful one, and when published the sale amounted in a very short time to about 30,000 copies. Subsequently, the author of 'Mammon' wrote several works in competition, and was equally successful, as in 'Britannia,' written on behalf of the spiritual interest of British seamen, and the 'Great Commission,' a work on the subject of Christian Missions. He also published 'The Christian Citizen,' an enlarged edition of a sermon preached for the London City Mission. In 1838 he received from an American college the diploma of D.D. In the same year he became the head of Cheshunt College, the training seminary for students of the Countess of Huntingdon's connexion. The friends of the Independent cause having resolved to unite some of their smaller divinity colleges into one, in order to increase their usefulness, the New College was built in St. John's Wood, and Dr. Harris was invited to become Principal, a post which, since 1850, he has filled with much efficiency. Dr. Harris married in 1838 Miss Wrangham, a niece of Archdeacon Wrangham. His more important works, published of late years, are three octavo volumes, intended to form part of a series extending to eight volumes in all;—The Pre-Adamite Earth; Man Primeval; Patriarchy, or the Family: its Constitution, and Probation.

*HARRIS, SIR WILLIAM SNOW, is a member of the College of Surgeons, but is chiefly known for his researches in meteorology, and his demonstration of the course of action of the electric fluid in thunderstorms, as well as of the modification in the form and construction of lightning conductors, required to ensure protection for ships

and buildings. He was born at Plymouth in the year 1791. His researches have gone to remove certain popular errors as to what have been called 'conductors' and 'non-conductors' of electricity, and to show the inutility of the old form of lightning-rod in the majority of cases; it being necessary, in place of such mere form, to link into one great chain all the metallic bodies employed in the construction of a building,—providing, in connection with these, conductors between the highest parts and the ground,—the single conductor, in one highest part, being possibly insufficient to divert the course of the fluid, and protect the whole fabric. These general principles have been largely applied to the protection of the ships of the Royal Navy during the last five-and-twenty years, under his advice and direction; and, laying aside the opinions which had been commonly received, the masts themselves of a ship have all been rendered perfectly conducting, by incorporating with the spars capacious plates of copper,—whilst all the large metallic masses in the hull have been tied as it were into a general conducting chain, communicating with the great conducting channels in the masts, and with the sea. This may be considered as the greatest experiment ever made by any country in the employment of metallic conductors for ships; and the result has been to secure the navy from a destructive agent, and to throw new light upon an interesting department of science. Sir W. S. Harris was employed to affix the lightning conductors to Buckingham Palace upon his system. He is also the inventor of a new steering compass. He has received the Copley medal of the Royal Society, of which he is a fellow; in 1845 the late Emperor of Russia presented to him a vase; and in 1847 he was knighted in acknowledgment of his scientific services. He is the author of several papers and tracts on electricity and magnetism, and on the danger by lightning to the British navy, and of a work on thunderstorms; and he has given reports on meteorology to the British Association for the Advancement of Science.

HARRISON. [HOLINSHED.]

HARRISON, JOHN, was born at Faulby, near Pontefract, in Yorkshire, in the year 1693. He was the son of a carpenter, which profession he also followed during several years. In 1700 the family removed to Barrow, in Lincolnshire. Harrison early displayed an attachment to mechanical pursuits, and his attention was particularly directed to the improvement of clocks. After many failures and many minor improvements, he at length succeeded in constructing a pendulum, the excellence of which depended on the different degrees in which metals are expanded or contracted by variations of temperature. This important principle is now employed in the construction of the balance-wheels of chronometers, and is that on which the accuracy of those timekeepers mainly depends.

In the year 1714 an act was passed offering a reward of 10,000*l.*, 15,000*l.*, and 20,000*l.* respectively, for a method of ascertaining the longitude within 60, 40, or 30 miles. In 1735 Harrison came up to London with a timepiece which he had constructed. Having obtained certificates of its excellence from Halley, Graham, and others, he was allowed, in 1736, to proceed with it to Lisbon in a king's ship, and was enabled to correct the reckoning a degree and a half. On this the commissioners under the act gave him 500*l.* to enable him to proceed with his improvements. After constructing two other timepieces, he at last made a third, which he considered sufficiently correct to entitle him to claim a trial of it, and the commissioners accordingly, in 1761, sent out his son William in a king's ship to Jamaica. On his arrival at Port Royal, the watch was found to be wrong only 5½ seconds; and on his return to Portsmouth, in 1762, only 1 minute 54½ seconds. This was sufficient to determine the longitude within 18 miles, and Harrison accordingly claimed the reward. After another voyage to Jamaica and some further trials, an act was passed, in 1765, which awarded the 20,000*l.* to Harrison, one-half to be paid on his explaining the principle of construction of his time-piece, the other half as soon as it was ascertained that the instrument could be made by others. After some delays and disputes, Harrison, in 1767, received the whole sum of 20,000*l.*

Next to the principle of the different expansibility of metals, which is applicable both to the pendulums of clocks and the balance-wheels of watches, the most important of the many inventions and improvements which in the course of fifty years he introduced, is perhaps that of the going fusee, by which a watch can be wound up without interrupting its movement.

He died at his house in Red Lion Square in 1776, in his eighty-third year. His phraseology is said to have been uncouth. On mechanics and subjects connected with that science he could converse with considerable clearness; but he found great difficulty in expressing his sentiments in writing, as is evident in his 'Description concerning such Mechanism as will afford a nice or true Mensuration of Time.' In the last volume of the *Biographia Britannica*, published in 1766, there is a memoir of Harrison drawn up from materials furnished by himself. See also Hutton's *Mathemat. Dict.* and the *Gallery of Portraits*, vol. v., p. 153.

HARRISON, THOMAS, generally called 'Harrison of Chester,' from his residence in that city, was born at Wakefield in Yorkshire, in 1744. While yet little more than a mere lad, he was sent to Italy, then considered almost the only efficient school for architectural study. During his stay at Rome, where he remained for several

years, he made designs for improving and embellishing the Piazza del Popolo, which obtained for him both a gold and silver medal from Pope Ganganeli; and he was also complimented by being elected a member of the Academy of St. Luke. On his return, one of his first works was a bridge of five arches over the Lune, at Lancaster, at which place he was subsequently employed upon various alterations and improvements in the castle. At Chester, he erected the pile known as the castle, which includes a jail, shirehall, and military barracks. The Chester county courts was considered at the time a very fine and correct specimen of the Grecian Doric style, and the portico certainly does produce more effect than ordinary in regard to columniation, for though only hexastyle, it has twelve columns, there being a second row of six columns behind those in front. The bridge which he erected across the Dee near Chester castle, consisted of a single arch of 200 feet span, being the largest stone arch which had been constructed. It is a very handsome structure. Mr. Harrison executed several works at both Liverpool and Manchester; in the former place the Athenæum, and the tower of St. Nicholas' church; in the latter, the Exchange buildings (since greatly enlarged and altered), the theatre (burnt down in 1843, and now succeeded by the new structure by Messrs. Irwin and Chester, opened September 29, 1845); and the library and reading-room called the Portico. The Hill column at Shrewsbury, the triumphal arch at Holyhead, and the jubilee tower erected on Moel Famma in commemoration of the fiftieth year of the reign of George III., are all by Harrison. He also built for the Earl of Elgin his new mansion of Broome Hall, in Scotland, in the Grecian Doric style, which seems to have been equally the favourite one of his noble employer and himself. Harrison died at Chester, March 29, 1829.

HARRISON, WILLIAM HENRY, President of the United States, was born in Virginia, 9th February 1773. His father was Benjamin Harrison, who was a member of the first Congress which met at Philadelphia in 1774, was one of those who signed the Declaration of Independence, and was afterwards governor of Virginia, his native state. He died in 1791. William Henry was educated at Hampden Sydney College, in Virginia, for the medical profession; but soon after the death of his father he joined a force which was raised to defend the Ohio territory against the Indians; and the next six years of his life were spent in military service. He was present, in the capacity of lieutenant of artillery, and distinguished himself at what is called the battle of the Miami, in which a signal victory was obtained over the Indians. After this he was placed in command of Fort Washington, one of the most important defences of the western frontier. In 1797, this war having been brought to an end, he resigned his commission, and was appointed secretary and ex officio lieutenant-governor of the north-western territory, then comprehending all the country to the north-west of the river Ohio. In 1799, when the north-western territory was admitted to what is called the second grade of territorial governments, entitling it to a legislative body composed of representatives chosen by the people, he was elected a member of the territorial congress. In 1801, when Indiana was erected into a territorial government, Harrison was appointed governor, and this situation he held till 1813. He distinguished himself both in the war with the Indians under Tecumseh in 1811, and in that with the English in 1812 and 1813. In both these wars he held the rank of a general. In 1816 he was returned to the House of Representatives as one of the members for Ohio. In 1824 he was elected to the Senate of the United States. In 1828 he was sent as minister from the United States to Columbia, but was recalled on account of a difference of opinion with General Jackson. By all these military and civil services General Harrison had acquired great popularity; and in 1840 he was elected president; but he died, at the official residence in Washington, on the 4th of April 1841, just one month after his installation in his new dignity, being the first president who had died in office. Harrison was a valuable public servant and an able man; but like all the recent American presidents he was not chosen from among the intellectually great men of America; and he was far inferior in mental characteristics to his predecessors in the presidential office—Washington, Adams, Jefferson, and Madison. In his 'Essay on the Aborigines of the Ohio valley,' which was published in the 'Transactions of the Historical and Philosophical Society of Ohio,' vol. i., 1839, he has made some interesting remarks on ancient Indian mounds and on the original state of the forests of America.

HARRY, BLIND, as he was commonly called, or Henry the Minstrel, lived towards the close of the 15th century. Major, the Scottish historian, remembered him to have been alive in his own boyhood, and he was born about the year 1470, according to Warton. The work for which Blind Harry is celebrated is a poem on the adventures of Wallace. It is in eleven books, in the heroic metre. Readers of Walter Scott will remember a note to one of his poems where he relates from Blind Harry the account of Wallace's meeting with Fawdoun in the 'Gask Hall.' There are many other very spirited descriptions in the poem, particularly those of fighting and war. Blind Harry is chiefly remarkable as affording in a small way a modern and true parallel to the account, true or false, which we have of Homer. (Warton, vol. i.; Jameson, *The Bruce and Wallace*, preface passim.)

* HART, SOLOMON ALEXANDER, R.A., professor of painting
NOG. DIV. VOL. III.

in the Royal Academy, was born at Plymouth, Devonshire, in 1806. At the age of fourteen he came to London in order to be placed as a pupil with Mr. Warren the line engraver, but some two or three years later he entered the schools of the Royal Academy with a view to adopting painting as his profession. For awhile he practised as a miniature painter, but he definitely abandoned that for painting in oil on the favourable reception of his first picture exhibited at the British Institution in 1828. The work which first attracted public attention however, partly no doubt from the uncommonness of the subject, though it was a most promising production, was a representation of a circumstance in the Jewish worship—'The Elevation of the Law,' exhibited at the gallery of the Society of British Artists in 1830: it was purchased by Mr. Vernon, and is now in the Vernon Collection. Mr. Hart now turned to British history and romance, showing, without any striking triumph, steady increase, each year, of technical skill, and artistic intelligence. In 1835 he was elected an associate, in 1840 a member of the Royal Academy. Since then Mr. Hart has been one of the most regular contributors to the academy exhibitions, and every year nearly he has sent several pictures. His works have been characterised by careful painting, conscientious study, a rich, yet grave, and occasionally almost sombre tone of colour, great technical knowledge, and manipulative skill, correct costume, and appropriate expression. Few contemporary artists have embraced so wide a range of subjects. We mentioned that he first attracted attention by depicting Jewish ceremonial observances: after for some time painting historical and poetic themes he returned with increased power to this class of subjects, among which are some of his most successful works—such as the 'Simchath Torah, or Festival of the Law,' in 1845 and 1850,—two gorgeous pourtrayals of the interior of Jewish synagogues, at the most imposing of their rites; another entitled a 'Scene in a Polish Synagogue,' &c. He has also painted several Italian and other cathedral interiors during the celebration of Romish ceremonies. Another class of pictures is taken from, or suggested by the Old Testament, as in his 'Hannah the Mother of Samuel and Eli the High Priest,' 'Solomon pondering the Flight of Time' (1853); 'Righteousness and Peace,' &c. Again he has sought to indicate a moral lesson by pictorial satire, as in his pair of Oxford Men (1852) 'The Student preparing for Honours,' and 'The Student preparing to be Plucked.' Then there has been an interesting biographical series, including such subjects as 'Galileo observing the Oscillations of the Lamp in the Cathedral at Pisa'; 'Milton visiting Galileo in the prison of the Inquisition'; 'The Parting of Sir Thomas More and his Daughter'; 'The three Inventors of Printing, Gutenberg, Fust, and Schöffer, studying the invention of Moveable Types.' Again there have been more strictly historical subjects, such as 'The Captivity of Ecelino, tyrant of Padua'; Shaksperian ones like 'Othello and Iago,' 'Jessica,' &c.; and more homely ones, such as 'Hop Picking.' It will be seen even by this very incomplete enumeration, that not only is Mr. Hart's range of subjects unusually wide, but that the choice is far removed from the ordinary routine. It ought perhaps to be added that he has painted several large show portraits for public buildings, such as the Duke of Sussex and Sir Anthony Rotshchild for the Jews' Hospital; Sir Moses Montefiore for another Jewish institution; and Alderman Salomons (Lord Mayor) for the Guildhall.

In 1854 Mr. Hart was elected to succeed Mr. Leslie, as professor of painting at the Royal Academy; and his lectures, reported in the 'Athenæum,' show that he not only possesses adequate professional learning for the office, but that by his earnest inculcation of intellectual exertion, of the necessity of a wide range of study, constant reference to the fundamental principles of art, observation of the predominant sentiment and essential characteristics of a composition, and of reflection, discrimination, and self-reliance in choice of subjects, he is a valuable guide-monitor to the enthusiastic student at the commencement of his career.

HARTE, WALTER, was educated at Marlborough School and Oxford. The dates of his birth and academic life are uncertain; he seems to have been born about 1700, and to have graduated as M.A. of St. Mary's Hall on the 21st of January 1730, according to the 'Catalogue of Oxford Graduates.' At an early age he became acquainted with Pope, whose style he imitated; and in return the great poet corrected his admirer's verses. With this advantage, Harte published 'Poems on Several Occasions,' 1727; 'Essay on Satire,' 1730; 'Essay on Reason,' 1735, to which Pope is said to have contributed very considerably; 'Essay on Painting,' date unmentioned; 'The Amaranth,' 1767, his last work. As a poet however he is not distinguished from other once successful but now forgotten imitators; but he has made a valuable addition to our literature in his 'History of the Life of Gustavus Adolphus,' 2 vols. 4to, 1759; republished in 8vo, corrected and improved, in 1763. An affected, harsh, and pedantic style has done much to throw discredit and neglect on this laborious and able work. It was translated into German, with preface, notes, and corrections, by J. Gottl. Böhme. Harte left unfinished, in manuscript, a 'History of the Thirty Years' War.' The account of his life is soon told. He took orders, acquired reputation as a preacher, was appointed principal of St. Mary Hall, and through the interest of Lord Chesterfield, whose son's tutor he had been, canon of Windsor. He died at Bath in 1774.

HARTLEY, DAVID, was born on the 30th of August 1705, and

was the son of a clergyman of Armley in Yorkshire. Having been first educated at a private school, he entered, at fifteen years of age, at Jesus College, Cambridge, and became in time a Fellow of that society. Scruples, which would not allow him to subscribe the Thirty-nine Articles, prevented him from afterwards entering the Church, as had been originally intended, and he applied himself to the medical profession. In this profession he practised with success, and attained to considerable eminence.

He commenced the composition of the work by means of which he has become universally known—the ‘Observations on Man, his Frame, his Duty, and his Expectations’—at the age of twenty-five. It had been the subject of his thoughts even previously to this. He tells the world in his preface, that the fundamental idea of the work, the possibility of explaining all states of mind by association, was first suggested to him by Mr. Gay’s admirable ‘Essay on the Fundamental Principle of Virtue or Morality,’ prefixed to Law’s translation of Archbishop King’s ‘Origin of Evil.’ Although begun so early as 1730, the work was not finished until sixteen years after, and it was ultimately published in 1748.

Dr. Hartley was twice married, and had children by both marriages. He practised medicine successively at Newark, Bury St. Edmunds, in London, and at Bath, where he died on the 25th of August 1757, at the age of fifty-two years.

Combining as he did with his profession the pursuit of learning, Dr. Hartley enjoyed through life the friendship of many distinguished literary men of his time. Among these may be mentioned Bishops Law, Butler, Warburton, and Hoadley, Dr. Jortin, Young the poet, and Hooke the Roman historian. One of his children thus writes concerning the qualities of mind and heart which endeared Dr. Hartley to his private friends: “His thoughts were not immersed in worldly pursuits or contentions, and therefore his life was not eventful or turbulent, but placid and undisturbed by passion or violent ambition. From his earliest youth his mental ambition was pre-occupied by pursuits of science. His hours of amusement were likewise bestowed upon objects of taste and sentiment. Music, poetry, and history were his favourite recreations. His imagination was fertile and correct; his language and expression fluent and forcible. His natural temper was gay, cheerful, and sociable. . . . The virtuous principles which are instilled in his works were the invariable and decided principles of his life and conduct.”

The chief end and great achievement of Hartley’s great metaphysical work is the application of the principles of association to all our states of mind, or, as he himself calls them, not perhaps very happily, “our intellectual pleasures and pains.” But before proceeding to set forth and apply the principle of association, he attempts to explain physically sensations and ideas, which he resolves into vibrations of the medullary substance. The first hints of this his doctrine of vibrations were derived, he tells us, from Sir Isaac Newton; but, while such speculations as these do not properly belong to the province of the psychologist, it is obvious that they can never rest upon any better foundation than conjecture. The commencement therefore of Hartley’s work detracts from rather than enhances its value. But the doctrine of vibrations being dismissed, the principle of association, of which little more than hints had previously been given by Hobbes and Locke, is explained and applied by Hartley with a fullness and acuteness which will ever render the work valuable. The second part of the work is wholly occupied with natural and revealed religion.

HARTSOEKER, NICOLAS, a Dutch natural philosopher, was born at Gouda in 1656: his father, who was a minister of the Reformed religion, intended that he should enter the Church as a profession; but a taste for the sciences, which the youth early evinced, prevented this intention from being carried into effect. From the money which was allowed him by his father, young Hartsoeker saved money enough to pay the fees of a teacher of mathematics; and he passed the greater part of each night in studying the subjects connected with the instruction which he received by day.

An accidental circumstance is said to have directed his attention to the construction of optical instruments: having presented a filament of glass to the flame of a candle, he was surprised to observe that the extremity, when melted, assumed a spherical form; and he immediately conceived the idea of using such spheres as object-glasses for microscopes. In an account which he published in 1678 of the instruments thus formed, he asserts that he discovered the animalcules which exist in animal fluids [LEUWENHOEK]; and, with the like instruments, Latorre is said to have first perceived the red globules in blood.

In 1674 Hartsoeker was sent to pursue his theological studies at Leyden; and in that city he became known to Huyghens, who encouraged him in the prosecution of his microscopical observations. The two philosophers subsequently went together to Paris, where Hartsoeker was introduced to Cassini, who recommended him to exercise his ingenuity in the formation of object-glasses for telescopes; and it appears that, after several fruitless essays, he succeeded in obtaining some which were superior to any that had been before executed. These were of about 600 feet focal length; and in order that they might have truly spherical forms, he first, by means of sand, made a very shallow excavation in a plate of glass; then giving, by the like means,

a slight convexity to one side of the plate of which the intended object-glass was to be formed, he placed the convex side of the latter in the cavity of the other, and by friction brought the contiguous surfaces of both plates to equal and consequently spherical figures. In 1694 he published his ‘Essai de Dioptrique,’ 4to, Paris, in which, besides treating of the science, he attempted to give a general theory of the laws of nature respecting the hardness, elasticity, transparency, &c., of bodies. These subjects were afterwards explained in detail in his ‘Principes de Physique,’ which he published in 1696. The work was criticised by a writer in the ‘Journal des Savans’ in the same year, and Hartsoeker seems to have revenged himself by making a violent attack on the ‘Mémoires de l’Académie des Sciences.’ The attack however remained unnoticed. It appears to have been the character of Hartsoeker to seek occasions of entering into discussions with his friends; and he at length lost the good opinion of the patient Leuwenhoek by urging captious objections to the results of some of his experiments.

Having become embarrassed in his circumstances, Hartsoeker was obliged, in 1696, to quit Paris. He retired to Rotterdam, where he published the work above mentioned; and he afterwards removed to Amsterdam. At this time he was introduced to the Czar Peter, then travelling incognito, and he was appointed to give the monarch lessons in mathematics. His conversation was so agreeable to the czar that the latter invited him to Russia. Hartsoeker however declined leaving Amsterdam, and the magistrates of the city built for him an observatory in one of the bastions.

The elector palatine having repeatedly offered Hartsoeker the place of professor of mathematics and philosophy at Düsseldorf, he at length accepted it, and in the year 1704 he went to reside in that city. While he held this post he made several journeys to different parts of Germany in order to visit the learned men of the country; and at Hanover he was presented to the elector by the celebrated Leibnitz. On his return to Düsseldorf he caused three burning-lenses similar to those of Tschirnhausen to be executed. On the death of the elector palatine, Hartsoeker, declining the solicitation of the landgrave of Hesse-Cassel that he would reside in that city, retired to Utrecht, where he died in 1725. He had been admitted a foreign associate of the Académie des Sciences of Paris in 1699; and he was also a member of the Academy of Berlin.

Hartsoeker is said to have entertained at one time an opinion that there existed in every animal a plastic soul which was charged with the preservation and development of the individual. He is said to have maintained also, and the opinion was probably founded on a more refined idea expressed by Plato in the *Timæus*, that from the divinity descended a succession of intelligent beings, the lower orders of which directed and preserved the universe; he had moreover some wild notions respecting an empire which he imagined to exist in the interior of the moon.

In 1722 Hartsoeker published a work entitled ‘Recueil de plusieurs Pièces de Physique, où l’on fait principalement voir l’Invalidité du Système de Newton.’ He also caused a letter to be printed in the ‘Journal des Savans,’ containing some absurd remarks on the hypothesis of the English philosopher. He treated Leibnitz no better, attacking with great violence his system of ‘monads’ and of a ‘pre-established harmony.’ He would never admit the advantages of the ‘Infinitesimal Calculus,’ and persisted in considering it as an unintelligible jargon by the aid of which certain learned men sought to increase their reputation. He is characterized by J. Bernoulli as a superficial and an arrogant man; but his violence is supposed to be less owing to envy than to a morbid taste for dispute.

HARUN-AL-RASHID. [ABBASIDES.]

HARVEY, WILLIAM, was born at Folkstone on the 1st of April 1578, and after having been some years at the grammar-school of Canterbury, was admitted at Caius College, Cambridge, in 1593, being then in his sixteenth year. Having devoted himself to the study of logic and natural philosophy for six years in that university, he removed to Padua, at that time a celebrated school of medicine, where he attended the lectures of Fabricius ab Aquapendente on anatomy, of Minardus on pharmacy, and of Casserius on surgery. He was admitted doctor of medicine there, and returned home at the age of twenty-four. At thirty he was elected Fellow of the College of Physicians, and shortly after appointed physician to St. Bartholomew’s Hospital. On the 4th of August 1615, he was chosen by the college to deliver the Lumleian lectures on anatomy and surgery, and upon this occasion he is supposed to have first brought forward his views upon the circulation of the blood, which he afterwards more fully established, and published in 1628.

The importance of this great discovery was such, that it will be necessary to investigate from the writings of the author the steps by which it was attained. We are informed by Boyle in his ‘Treatise on Final Causes,’ that in the only conversation which he ever had with Harvey, he was told by him that the idea of the circulation was suggested to him by the consideration of the obvious use of the valves of the veins, which are so constructed as to impede the course of the blood from the heart through those vessels, while they permit it to pass through them to the heart. Before the time of Harvey the opinions on the circulation were numerous and inconsistent. The blood was supposed to be distributed to the various parts of the body by

means of the veins, and that intended for the nutrition of the lungs by the action of the right side of the heart. According to the same doctrines the arteries were destined for the conveyance of the vital spirits, which were formed in the left side of the heart from the air and blood derived from the lungs. These vital spirits were supposed to be taken in by the arteries during their diastole, and distributed by them during their systole, whilst the vapours or fuligines, as they are called by Harvey, were returned to the lungs by the action of the left ventricle. Opinions did not agree upon the mode in which the blood found its way to the left side of the heart, for whilst some supposed that it was conveyed with the air from the lungs, others maintained that it transuded by certain imaginary pores in the septum between the ventricles. These opinions, it is evident, rested more upon imagination than any careful observation of facts. Those of Harvey, on the contrary, were drawn from the most accurate dissections of dead and living animals, and supported by arguments depending entirely upon the anatomical structure and obvious uses of the parts. The result of these observations is thus stated by him. The heart has periods of action and of rest, but in warm-blooded animals its motions are so rapid, that the different steps of them cannot be distinguished. In cold-blooded animals they are more slow, and in warm-blooded also after the examination of its action, by opening the chest in a living animal, has been continued some time. During its action the heart is raised, and its point tilted forward so as to strike against the parietes of the chest. It contracts in every direction, but more especially on its sides; it also becomes harder, as other muscles do during their contraction. In fishes and cold-blooded animals the heart may be observed to become paler during its systole, and assume a darker colour during its diastole. If a wound be made in the ventricle, the blood is ejected from it during its contraction. From these facts Harvey concluded that the essential action of the heart is its systole, and not its diastole, as was supposed by physicians before his time, and that the result of this contraction is the expulsion of the blood into the pulmonary artery and aorta. The diastole of the arteries or pulse is synchronous with and caused by the propulsion of the blood during the systole of the ventricle, and is a passive, and not, as was previously supposed, an active operation of the vessels. If the motions of the heart be carefully observed for some minutes, it will be seen first that the two auricles contract simultaneously, and force the blood contained in them into the ventricles; and secondly, that the ventricles in their turn assume the same action, and propel most of the blood into the pulmonary artery and aorta, from which it is prevented from returning by the valves situated at the entrance of those vessels. The author next proceeds to describe the manner in which the blood passes from the right to the left side of the heart.

During fetal life, says he, this is sufficiently evident. Part of the blood passes directly from the right to the left auricle through the foramen ovale, whilst the rest is conveyed into the right ventricle, and by its contraction forced into the pulmonary artery, and so through the ductus arteriosus into the descending aorta; for, as he observed, the lungs do not admit of its passage through them in the fetus. In the adult a new condition is introduced, namely the function of the lungs, by which, as Harvey observed, the question was so much obscured that physicians were unable to give a correct explanation of the phenomena. However, the consideration of the obvious use of the valves of the pulmonary artery had led Galen to maintain that a portion of the blood contained in that vessel passed through the lungs into the pulmonary veins, but this passage he supposed to depend more upon the action of the lungs themselves than of the heart. Harvey carried out this argument still further, and maintained from it that the whole of the blood which is propelled from the right side passes through the lungs to the left side of the heart. In like manner he showed that the blood is propelled from the left ventricle into the arteries and so distributed to all parts of the body. He next proceeded to give approximate calculations of the quantity of blood which passes from the veins through the heart in a given time. This he showed to be so much more than is required for the nutrition, or can be supplied to the veins by the absorption of alimentary substances, that the surplus must of necessity return through the various tissues of the body to the veins again. He then argued from the construction of the valves of the veins that the course of the blood in them must be from the smaller to the larger divisions, and thus to the heart again. These views he still further confirmed by reference to the now well-known effects of ligatures placed on a limb with different degrees of tightness. If the ligature be so placed as to compress the veins alone, they become swelled and tumid beyond the ligature, and quite empty between it and the heart, whilst the pulsations of the artery remain unaltered. If it be drawn a little tighter the pulsations of the artery cease beyond, but are felt more violent than usual just within the ligature.

Such is a brief abstract of the principal steps in this the greatest and most original discovery in physiology, which was so directly opposed to all the previous notions of physicians, that its author might well observe, "Adeo nova sunt et inaudita ut non solum ex invidia quorundam metum malum mihi, sed verarum ne habeam inimicos omnes homines: tantum consuetudo aut semel imbibita doctrina alioque defixa radicibus quasi altera natura, apud omnes

valet, et antiquitatis veneranda suspicio cogit." This anticipation proved correct; for Harvey afterwards complained to one of his friends, that his practice fell off considerably after the publication of his treatise 'On the Circulation of the Blood,' and it is well known that the doctrine was not received by any physician who was more than forty years old. His opinions were violently opposed by Primrosius, Parisanus, Riolanus (1645), and others. Parisanus was ably refuted by his friend Dr. George Ent, Fellow of the College of Physicians, and other advocates of Harvey's views appeared on the Continent. The only man who was honoured by a reply from Harvey himself was Riolanus, professor of anatomy in Paris, in answer to whom he published two letters. In 1652 Harvey had the satisfaction of seeing one of his early opponents, Plempius, professor at Louvain, declare himself a convert to his opinions, and by his example many more were induced to withdraw their opposition. In the whole of this controversy, says Sprengel ('Hist. of Med.,' sect. xii, c. 1), the discretion and rare modesty of Harvey afford the best model for naturalists and scientific writers.

Harvey had been so much disgusted by the disputes in which he was involved on the publication of his views on the circulation of the blood that he had determined to publish nothing more, and it was only at the earnest request of his friend Dr. Ent that he was induced to allow his 'Exercitationes de Generatione' to be printed. This work consists partly of a commentary upon the writings of Aristotle and Fabricius ab Aquapendente on the same subject, and partly of details of his own observations and experiments. The earlier 'Exercitationes' contain a description of the organs of generation in the common fowl, of the formation of the egg and its extrusion from the body, and of the use and nature of its various parts, as well as the changes which it undergoes during the process of incubation. He then proceeds to enter upon some discussions on the nature of the act of generation, and of the degree in which the male and female respectively contribute to its performance, in the course of which he examines the opinions of Aristotle upon this abstruse subject, and advances some of his own. The concluding treatises contain a description of the analogous processes in the deer.

Without venturing upon an abstract of the whole contents of these papers, we shall endeavour to give some idea of the knowledge possessed by Harvey, and especially of his own discoveries and additions to this most interesting branch of physiology. He described the organs of generation in the fowl: he observed that the vitellus or yolk is at first in vascular connection with the parent, that this connection is afterwards broken off, and that in its passage through the oviduct the layers of albumen are added, and that before its final extrusion from the body of the mother the hard shell was formed: he asserted that all these parts, even the shell itself, are formed from the same substance under the influence of the assimilative power of the egg itself, and are not mere secretions from the organs of the parent, as was previously supposed: he was the first to describe accurately the two layers of albumen, and to show that each is contained in its own proper membrane: he was aware that the shell is porous, and admits of the respiration of the chick through it: he described the chalazae at each end of the egg, and showed that they exist in the unimpregnated as well as the impregnated egg; whereas it had been previously supposed, and especially by his master Fabricius, that these parts represent the germ from which the future chick was to be formed. The greatest discovery however made by Harvey in this branch of physiology was the use and importance of the 'cicatricula,' which he showed to be the true germ in which all the future changes take place, and for the increase and nutrition of which all the other parts of the egg are destined. He showed that it is present before the yolk has left the ovary, and pointed out the error of Fabricius, who considered it the remains of the pedicle by which the vitellus was attached to the ovary: he was aware that eggs occasionally contain a double yolk, and asserted that twins are produced from such eggs, but that they do not survive. The fifteenth and seven following 'Exercitationes' contain a description of the changes which the egg undergoes from the first to the fourteenth day of incubation. He described minutely the changes which take place in the cicatricula at the end of the second day. These observations appear to have been quite original:—"At this time it attains the size of the finger-nail nearly; two and sometimes three concentric layers may be observed in it. The central one is the most transparent of the two. In the middle of it is a white speck, which from its appearance may be compared to a cataract in the centre of the pupil of the eye. During this day the central layer especially enlarges and entrenches upon the external one." This description appears to accord with that of the 'area pellucida,' to which so much importance is attached by later writers on this subject. "At the end of the third day a pulsating spot may be observed in the centre of the 'cicatricula,' which forms the rudiment of the future heart." He observed that the pulsations may be called forth afresh, when languid or intermitted, by the employment of various stimuli: he showed that the liver is formed round the umbilical vein, but he does not seem to have been aware that the liver, as well as all the other glands whose ducts communicate with the intestinal canal, is a prolongation or growth from the intestinal sac: he described five umbilical vessels, of which three are veins and two arteries, one of the veins being distributed to the albumen, the other four vessels to the vitellus. The first-mentioned

vein goes to the vena cava, the other two to the vena porta, just before it enters the liver. The arteries are branches of the common iliac. On this point, though his observations are correct as far as they go, his knowledge fell short of that of later inquirers; for he does not appear to have had any very accurate acquaintance with the uses of the allantois. He was aware that the vitellus is drawn into the intestine of the chick shortly before hatching, and serves for its early nutriment; and in this relation he well compared it to the milk. This fact was known to Aristotle. He corrected the error of Fabricius, who supposed that the egg is chipped by the hen, and showed on the contrary that this process is performed by the chick itself.

His observations on the process of generation in *Mammalia* were confined chiefly to the deer species, of which he was enabled to obtain numerous specimens by the liberality of Charles I., who allowed him to take them from the royal parks. He supposed conception to take place either in the uterus or its horn. This view, as is now well known, is incorrect. His description of the vessels and of the placenta is of considerable value.

Harvey noticed the late union of the lateral parts of the upper lip, and assigned it as a cause of the frequency of hare-lip. He claims to have been the first to discover the connection between the bronchi and the abdominal cells in birds, and to show that in all birds, serpents, oviparous reptiles, quadrupeds, and fishes, kidneys and ureters exist—a fact unnoticed by Aristotle and all succeeding writers. This account is, we apprehend, sufficient to show the extent and importance of the discoveries of Harvey in this branch of physiology, and to make us withhold our assent to the assertion of Sprengel (sect. 12, ch. 6), that the treatise 'De Generatione' is unworthy of the discoverer of the circulation.

In 1623 Harvey was appointed physician extraordinary to James I., with a promise of succeeding on the first vacancy to the physicianship in ordinary, the duties of which he actually performed. He was afterwards physician to Charles I., and was in the habit of exhibiting to him and to the most enlightened persons of his court the motion of the heart and the other phenomena upon which his doctrines were founded. During the civil war he travelled with the king, and while staying for a short time in Oxford was made by him master of Merton College, and received the degree of Doctor of Medicine. He held the mastership however for only a few months, when Brent, who had been expelled by the king for favouring the parliamentary cause, was replaced by that party, which had now gained the ascendancy. Soon after his house was plundered and burned by the same party, and unfortunately several unpublished works, of which we have only notices in his other writings, were destroyed. The latter years of his life were chiefly spent at his country-house at Lambeth, or at his brother's near Richmond. In 1654 he was elected President of the College of Physicians, but in consequence of his age and infirmities he was induced to decline that honourable office. He testified his regard however for the society by presenting them with his library, and conveying over to them, during his lifetime, a farm which had been left him by his father. He died on the 3rd of June 1657 in the eightieth year of his age, and was buried at Hempstead in Essex, where a monument was erected to his memory.

The best edition of Harvey's works, which were written in correct and elegant Latin, is that published by the College of Physicians in 1 vol 4to in 1766, with an engraving by Hall from the portrait by Cornelius Jansen, in the college library. They consist of the 'Exercitatio de Motu Cordis et Sanguinis,' 'Exercitationes duae Anatomicae de Circulatione Sanguinis, ad J. Riolanum, Fil.;' 'Exercitationes de Generatione Animalium,' 'Anatomia Thomae Parri;' and nine Letters to celebrated contemporaries on different anatomical subjects. Among the works destroyed were—'Observationes de usu Lienis;' 'De Motu Locali;' 'Observationes Medicinales—De Amore Libidine et Coitu Animalium;' 'De Insectorum Generatione;' 'De Quantitate Sanguinis Singulis Cordis Pulsationibus Protrusa;' and 'Tractatum Physiologicum.' Two other manuscript works by him are preserved in the Library of the British Museum; one, 'De Musculis et Motu Animalium Locali;' the other, 'De Anatomie Universalis;' in the latter of which, bearing date April 1618, the principal propositions of the doctrine of the circulation are contained.

(Life, prefixed to his works; Sprengel, *History of Medicine*.)

* HARVEY, WILLIAM, remarkable in English art as a designer for engravings, especially for engravings on wood, was born at Newcastle-upon-Tyne in 1796. At the age of fourteen he was apprenticed to Thomas Bewick, who was also born at Newcastle, and was there apprenticed to an engraver. [Bewick.] Bewick has been truly described as "the reviver of wood-engraving," which had almost become a lost art. But his great natural genius as a designer raised him far above the technical excellence of the engraver. When William Harvey became his pupil, Bewick had attained a great reputation. The productions of his workshop included the humblest as well as the highest branches of wood-cutting, from the grocer's tobacco-papers, to the exquisite 'Quadrupeds' and 'Birds,' which he designed and engraved with admirable taste and fidelity. Under such a master young Harvey had the best preparation for his future labours. He became one of the most valued assistants of his instructor in his latter years; and engraved the larger portion of the cuts of the 'Fables,' which were published in 1818. Many of the drawings on the wood

were made by him. Mr. Harvey came to London in 1817, to extend his knowledge of art. Under the generous care of Haydon he went through a course of anatomical study, in company with the Landseers, Lance, and others; maintaining himself by designs for wood-engravers, and working hard as an engraver. From Haydon's picture of 'Dentatus' he produced one of the largest and most elaborate wood-engravings; executed with a breadth and finish that have rarely been equalled. But at this period, 1821, the demand for wood-cuts was comparatively small. Such illustrations were principally confined to school-books, and very few persons were engaged in the profession. In 1824 Mr. Harvey ceased to be an engraver, and elevated himself to that branch in which he has been occupied for more than thirty years—that of a designer. The extent of his labours in connection with illustrated books exhibits one of the most remarkable examples of industry in the history of art. But the number of his designs is less surprising than their variety. With that accurate observation of the habits of quadrupeds, which he probably derived from his early studies with Bewick, his zoological illustrations would alone command admiration. But in the higher orders of design, whether strictly historical or purely imaginative, the resources of his prolific genius appear rarely to have failed, however hurried the demands upon his taste and invention. The abundance of his works has necessarily involved conventional forms which detract from his originality in some cases. To enumerate even the works wholly illustrated by himself would occupy a considerable space. We may mention amongst his earlier labours the illustrations to Dr. Henderson's 'History of Wines,' 'The Tower Menagerie,' 'The Zoological Gardens,' and Northcote's 'Fables.' Amongst his later 'The Pilgrim's Progress.' Perhaps the book upon which his fame as a true artist will mainly rest is 'The Thousand and One Nights,' translated by Mr. Lane. In the combination of the most luxuriant fancy with the strictest accuracy of costume, the splendour and grace of oriental life were never more happily presented than in the hundreds of designs in these three volumes. Many of the imaginative designs to Mr. Knight's 'Pictorial Shakspeare' are also favourable specimens of his ability. As a designer upon wood, Mr. Harvey has given a powerful impulse to the excellence of an art now so widely employed. He has always known its limits and capabilities; and in this technical superiority above other designers, he has contributed to form many of the best of existing engravers.

HARWOOD, EDWARD, a biblical and classical scholar of the last century, was born in Lancashire in 1729 and educated as a dissenting minister. In that capacity, after going through various other employments, he accepted the charge of a congregation at Bristol, in 1766, which however, at the end of five years, he was obliged to quit, in consequence of reports (unfounded it is said) touching his religious opinions, which gave offence to his congregation, and also of a slur cast on his moral character. He then removed to London, devoted the rest of his life to private tuition and literary labour, and died in distress, January 14, 1794. He used to say that he had written more books than any living author, except Dr. Priestley. (For the list, see Watt, 'Bibl. Britann.')

His reputation as a scholar rests chiefly on his 'View of the various editions of the Greek and Roman Classics,' 1775, fourth and best edition 1790. It has been translated into German and Italian. His 'Biographia Classica, the Lives and Characters of the Greek and Roman Classics,' 1778, a new edition of an old book, with additional matter, is another useful work. Dr. Harwood also published an 'Introduction to the Study of the New Testament,' 1767; a 'New Translation of the New Testament,' 1768; a new edition of the Greek Testament, with English Notes, 1776, &c.

HASDRUBAL, the name of several Carthaginians.

1. Hasdrubal, the son-in-law of Hamilcar. [HAMILCAR.]

2. Hasdrubal, the son of Hamilcar and brother of Hannibal. [HANNIBAL.]

3. Hasdrubal, who commanded the Carthaginians in their last war against the Romans, B.C. 146.

HASSE, ADOLPH, a composer of great celebrity during the early part and middle of the last century, was born at Bergedorf, near Hamburg, in 1705. When very young, he distinguished himself as a superior tenor singer, but soon left Germany for Italy, and became first the disciple of Porpora, then of Alessandro Scarlatti. In 1725 he produced an opera, 'Sesostrate,' at Naples, which was followed by others in different parts of Italy. In 1738 Hasse, being then in London, was engaged by the noblemen hostile to Handel to compose for the opposition Italian theatre, at which he brought out with success his 'Artaserse.' He could not however be persuaded to remain in London, the head-quarters of a cabal he did not approve, but went to Dresden, where he remained several years. It was there, in 1745, that Frederick of Prussia heard his 'Arménio,' which so pleased that warlike, musical, and commonly parsimonious prince, that he sent the composer 1000 dollars and a diamond ring. In 1760, at the bombardment of Dresden, Hasse lost all his property, including his valuable manuscripts, by fire. In 1763 he was obliged, by changes made in the court of Dresden, to leave that city, and proceed to Vienna. In that capital he wrote several operas. He finally retired to Venice, where he produced a grand 'Te Deum,' which was performed before the pope in the church of Santo Giovanni. He died in 1783. Some years previous to his decease he composed a 'Requiem' for his own funeral, which was duly applied to the intended purpose, and is a work affording evidence

of his powers in an advanced period of life. Hasse is certainly entitled to be considered as one of the best composers of his day. Some of his productions, and among these his 'Pellegrini' and two Litanies, are much admired by unprejudiced judges; but many of his operas have sunk into an oblivion by no means unmerited.

HASSELQUIST, FREDERIC, a Swedish naturalist, and pupil of Linnæus, was born at Törnvala, in East Gothland, on the 3rd of January 1722, old style. His father, Andrew Hasselquist, a poor curate, having died young, without having made any provision for his family, his wife's brother, a clergyman of the name of Pontin, took charge of young Hasselquist's education, and placed him with his own children in the school of Linköping. After the death of his benefactor, Hasselquist was transferred to the university of Upsal, where he entered in 1741. He there acquired a taste for natural history, became a pupil of the great Linnæus, and was led very particularly to apply himself to the study of the properties of plants. An inaugural thesis, called 'Vires Plantarum,' which appeared in 1747, evinced him to be a young man of a strong original turn of mind, and worthy of his master. He showed how puerile were the notions at that time entertained regarding the medical properties of many plants, how much the whole of vegetable materia medica stood in need of reformation; and he pointed out a philosophical mode of investigating the facts connected with it, by insisting upon the old doctrine of 'like forms, like virtues.' This truth, which is one of the most important among those connected with the practical application of botany to useful purposes, had been so obscured by want of science in the age immediately preceding Linnæus, that it had ceased to be a point of belief, and was rather set down as a fanciful speculation of forgotten theorists. Hasselquist however maintained its accuracy, and with so much skill that he may be said to have established it upon a solid foundation, from which it could never afterwards be shaken. This, and his general proficiency in other branches of science, procured Hasselquist some of the royal stipends provided for travelling students, and he was thus eventually enabled to carry into execution a favourite project of visiting the Holy Land for the laudable purpose of investigating its natural history. Having sailed from Stockholm in August 1747, he proceeded to Smyrna, thence to Egypt, and afterwards to the Holy Land. His constitution sunk however under the exertions of his enterprising spirit, and he died at Smyrna, on his return homewards, on the 9th of February 1752, in the thirty-first year of his age. The result of his investigations of these, at that time little known countries, was given to the world by Linnæus in the year 1757, under the name of 'Itin. Palæstinum.' This work showed that the author had combined with energy and industry great attainments in the sciences of his day. It is rich in observations upon the quadrupeds, birds, reptiles, fishes, insects, mollusca, plants, minerals, and materia medica of the countries he visited, and is to this day a standard work of reference. His science was not the flimsy, superficial, and unintelligible gossip of most modern travellers, but the sound matter-of-fact, precise, and definite information of which use may be made so long as science endures, whatever changes it may undergo in its forms. His name is perpetuated in botany by having been given to a curious genus of Egyptian Apiceæ.

HASTINGS, WARREN, a memorable name in the history of British India, was born in the middle rank of life in 1733, and after receiving the usual education at Westminster school, went out in 1750 as a writer in the service of the East India Company. His first advancement was due to his own industry and discernment, which led him to master the Persian and Hindustanee languages, a study at that time almost universally neglected; and he was therefore chosen for more than one useful and honourable employment, commercial and diplomatic, in the interior. After residing about fourteen years in India, he returned home with a moderate fortune, intending apparently to pass the remainder of his life in tranquillity. In 1769 however he unexpectedly received the appointment of second in council at Madras, and in 1772 was appointed to the highest office in the Company's service; that of President of the Supreme Council of Bengal. His powers were enlarged by the alteration of the Indian constitution by act of parliament, in virtue of which he became, January 1, 1774, governor-general and supreme head of all our Indian dependencies. Affairs were at this time in great disorder. The territories of the Company had been greatly extended by the conquests of Clive and his successors: but their dominion, authority, and influence were still unconsolidated, and were exposed during the government of Mr. Hastings to great danger from the inveterate enmity of Hyder Ali, rajah of Mysore, supported by the Mahrattas, and others of the native powers. That he did many things under the pressure of circumstances, which nothing but expedience could justify is hardly denied by his defenders or himself: indeed it seems to have been part of his defence, that Indian statesmen were not to be bound or judged by European rules of justice or morality. Right or wrong, he weathered the dangers to which the British Empire in India were exposed; and if he left the provinces under his charge wasted and depopulated, the increased revenue more than counterbalanced by the increased debt, he also left the power of our enemies broken, our own consolidated, and an easier task to his successors than fell to his own share.

Notwithstanding his services, Hastings gave satisfaction neither to

the Home administration nor to the Court of Directors. The public ear was offended by rumours of cruelty, corruption, and unjust aggression; the directors censured the lavish and corrupt expenditure, and the presumptuous independence of his conduct. Repeated attempts were made to obtain his dismissal, but these were uniformly defeated by the Court of Proprietors. Thus supported, he carried matters with a high hand; neglected or positively refused to obey the orders sent by the Directors; overruled the opposition of the Council, of which a majority was, in the first instance, opposed to his views [FRANCIS, SIR PHILIP]; and practically exercised an absolute and irresponsible power until February 1785, when he resigned his office and set sail for England, well aware that a storm awaited his arrival.

As soon as Mr. Hastings had arrived, Mr. Burke intimated his resolution of instituting an inquiry into the late governor-general's conduct. Proceedings however were not commenced until the session of 1786, in the course of which articles of impeachment were brought forward by Mr. Burke, charging him with numerous acts of injustice and oppression committed against native princes and people, dependants or allies of the Company; with the impoverishment and desolation of the British dominions; with the corrupt and illegal reception of presents himself; with the corrupt exertion of his great influence by conniving at unfair contracts, and granting inordinate salaries, and with enormous extravagance and bribery, intended to enrich his dependants and favourites. The several accusations were finally confined to four heads: the oppression and final expulsion of the rajah of Benares; the maltreatment and robbery of the Begums (or princesses) of the house of Oude; and the charges of receiving presents and conniving at unfair contracts and extravagant expenditure. The sessions of 1786-87 having been consumed in preliminary proceedings, the House of Lords assembled in Westminster Hall, February 13th, 1788, to try the impeachment, and on the 15th, the preliminary forms having been gone through, Burke, in the name of the Commons of England, opened the charges against the prisoner in a comprehensive, elaborate, and most eloquent speech [BURKE, EDMUND] which lasted upwards of three days. He was assisted in the management of this most arduous cause by Fox, Sheridan, Grey, and others. The sessions of 1788, 1789, and 1790 were consumed in going through the case for the prosecution. In 1791 the Commons expressed their willingness to abandon some part of the charges, with the view of bringing this extraordinary trial sooner to an end; and on the 2nd of June, the seventy-third day, Mr. Hastings began his defence. This was protracted till April 17, 1795, on which (the 148th) day he was acquitted by a large majority on every separate article charged against him.

There seems no doubt but that public opinion changed greatly during the trial; and that Mr. Hastings came to be regarded as an oppressed, instead of an offending man. This feeling was probably caused in a great measure by the suspicious appearance of so great a delay of justice, and the skilful manner in which Mr. Hastings and his counsel threw all the blame on the managers of the prosecution, when in truth the smallest share of it seems to have belonged to them. The extreme violence of their invective was perhaps calculated to hurt their cause, and the upper ranks, more especially the powerful interests connected with India, were disposed to look jealously at so close a scrutiny into the conduct and gains of an official man.

Mr. Hastings attempted to refute the charges of extortion by publicly asserting in the most solemn manner, that never at any time of his life was he worth 100,000*l*. The law-charges of his defence amounted to 76,080*l*. In March 1796 the Company granted him an annuity of 4000*l*. for twenty-eight years and a half, and lent him 50,000*l*. for eighteen years, free of interest. He retired completely from public life, to an estate which he purchased at Daylesford, in Worcestershire, formerly in the possession of his family. He died in August 22nd, 1818, having been raised to the dignity of privy-councillor not long before.

On his real character as a man and a statesman it is somewhat hard to decide. That his talents and his services were alike eminent, is admitted; that the means which he used were often most culpable, appears to be equally certain. His apology is to be found in the necessities of his situation, in the general neglect of justice in our dealings with the Asiatic princes, and the notorious laxity of Anglo-Indian morality, where making a fortune was concerned, in those days. Mr. Mill, after exhibiting without reserve or favour the errors and vices of Mr. Hastings' administration, thinks it necessary to recommend him to the favourable construction of the reader, on the ground that he "was placed in difficulties and acted on by temptations, such as few public men have been called on to overcome;" and he adds, "It is my firm conviction that if we had the advantage of viewing the conduct of other men, who have been as much engaged in the conduct of public affairs, as completely naked and stripped of all its disguises as his, few of them would be found whose character would present a higher claim to indulgence; in some respects, I think, even to applause. In point of ability he is beyond all question the most eminent of the chief rulers whom the Company have ever employed; nor is there any of them who would not have succumbed under the difficulties which, if he did not overcome, he at any rate sustained. He had no genius, any more than Clive, for schemes of policy, including large views of the past, and large anticipations of the future; but he

was hardly ever excelled in the skill of applying temporary expedients to temporary difficulties; in putting off the evil day, and in giving a fair complexion to the present one. He had not the forward and imposing audacity of Clive; but he had a calm firmness, which usually by its constancy wore out all resistance. He was the first, or among the first, of the servants of the Company who attempted to acquire any language of the natives, and who set on foot those liberal inquiries into the literature and institutions of the Hindoos, which have led to the satisfactory knowledge of the present day. He had that great art of a ruler, which consists in attaching to the governor those who are governed; and most assuredly his administration was popular, both with his countrymen and the natives in Bengal." (Book v., ch. 8.) The estimate of his character by Macaulay in his famous Essay is more favourable, but, on the whole, perhaps, not more so than was merited.

HAUGHTON, WILLIAM, a dramatic writer, was probably somewhat the junior of Shakspeare. In Henslowe's Diary, under the date of November 1597, he is called 'Young Haughton'; and his name occurs frequently in that curious record, till the end of the year 1600, but not later. In March 1599 Henslowe lent him ten shillings to pay a debt, for which he then lay in the Clink prison; and constant advances of small sums, in earnest of the price of dramas which he was writing for the old manager, show him to have been as poor or improvident as most of his fellow-playwrights. He wrote several plays unassisted; in others his coadjutors were Chettle, Day, and still more frequently Dekker, with whom indeed he seems to have stood in particularly close relations. In 1600 there was licensed a tragedy of his, not preserved, called 'Ferrex and Porrex'; and Mr. Collier has conjectured that Haughton's 'Devil and his Dam,' described as in progress about the same time, may have been an alteration of 'Grim, the Collier of Croydon.' The same critic is more confident in believing that 'The Spanish Moor's Tragedy,' for which, in February 1600 Henslowe made to Dekker, Haughton, and Day a payment of three pounds to account, was the wild tragedy called 'Lust's Dominion,' which was printed for the first time in 1657, and has been inserted (without reason) in the recent edition of Marlowe's works. But the only extant plays in which Haughton was certainly concerned are two. 1. He was sole author of the lively comedy called 'Englishmen for My Money; or, a Woman will have her Will,' which (under the latter title) appears in Henslowe's book in 1598. It was printed in 1616, 1626, and 1631, and has been reprinted in a small collection called 'The Old English Drama,' 1830, 4 vols. 12mo. 2. Dekker, Haughton, and Chettle were jointly the authors of 'The Pleasant Comedie of Patient Grisail,' entered at Stationers' Hall in March, 1600, printed in 1603, and reprinted from a very rare copy by the Shakespeare Society in 1841.

HAUKAL, ABUL KASEM MOHAMMED IBN, a celebrated Arabic traveller and geographer. The few particulars we possess concerning his life are derived from his own work. From this we learn that he paid great attention to the study of geography from his earliest years, and collected all the books he could obtain which treated of foreign nations; that partly with a view to obtain farther information, and partly to avoid the tyranny of the reigning sultan, and to improve his own fortune by trade, he set out from Baghdad, A.H. 331 (A.D. 942-3), in order to visit foreign countries. He does not tell us into what countries he travelled; but we learn from his own account that he was in Mesopotamia A.H. 358 (A.D. 968-9); in Africa A.H. 360 (A.D. 970-1); in Sicily A.H. 362 (A.D. 972-3); and in Mecca A.H. 364 or 5 (A.D. 974-5 or 975-6).

Haukal's work on geography is entitled 'A book of Roads and Kingdoms.' He states in the preface that he composed the work to give a description of all the countries in which the Mohammedan religion prevailed, together with the revenues, natural productions, and commerce of each. After giving a general view of the earth, and a brief description of the nations which do not profess the Mohammedan religion, he first describes Arabia, since it contains Mecca and the Caaba, and afterwards the seas and other countries subject to Mohammedana. The description of each country is accompanied by a map; but Abulfeda, who frequently quotes Haukal in his treatise on Geography, complains that the names are inaccurately spelled, and that the latitudes and longitudes are not put down in these maps. Haukal mentions the names of other writers on Geography, from whom he derived great assistance; namely, Ibn Khurdadbeh, Al Jihani, and Abul Faraj Kodama Ibn Jafar, whose works he always carried with him in his travels.

Manuscripts of Haukal's work on geography are rarely met with even in the East; there is a copy in the Bodleian Library at Oxford, and another at Leyden. From the latter MS. Uylenbroeck has given an interesting account of the work in his 'Itacæ Pernicæ Descriptio; præmissa est Dissertatio de Ibn Haukali Geographi codice Lugduno-Batavo,' 4to., Lug. Bat. 1822; to which we are indebted for the greater part of the preceding remarks.

Ouseley published, from what he conceived to be a Persian translation of the Arabic of Haukal, a work entitled 'The Oriental Geography of Ebn Haukal, a traveller of the 10th century,' Lond. 1800; and De Sacy gave a further account of this work in the 'Magasin Encyclopédique,' vol. vi. pp. 32-76, 151-180, 307-333. But Uylenbroeck has shown, in the work already referred to, that the Persian treatise trans-

lated by Ouseley cannot be regarded as either a translation or an abridgement of the Arabic of Haukal, since, independently of other differences, it appears to have been written in the beginning of the 4th century of the Hegira, while Haukal's work was not composed till A.H. 366 or 367. But he considers it probable from many circumstances that the Persian work was one of those which Haukal made use of in compiling his Geography, and that it was written by Ibn Khordadbeh.

HAUKSBEE or HAWKSBE, FRANCIS, was born in the latter part of the 17th century. The exact year of his birth is unknown, and also that of his death; but it appears from the minutes of the Royal Society that he was admitted a Fellow of that body in 1705, at which period it is probable he was appointed to the office of curator of experiments to the Society. Previous to the time of Hawksbee, electricity could not be said to exist as a science. Dr. Gilbert of Colchester had published a book on magnetism about the beginning of the 17th century, wherein he gave a list of certain substances which, when rubbed, acquire the property of attracting light bodies; and similar phenomena had likewise been observed by Boyle, but with the exception of these insulated facts nothing was known concerning electricity. Even the electrical discoveries of Mr. Hawksbee were not of any great importance in themselves, but, as Dr. Thomson observes in his 'History of the Royal Society,' "they constituted the beginning of the science, and, by drawing the attention of philosophers to that particular subject, were doubtless of considerable service in promoting electrical investigations." Between 1705-11, there appear several papers in the 'Transactions of the Royal Society,' giving a detailed account of his experiments. In 1706 he had recognised the electricity of glass by friction, and was thence led to the first rudiments of the electrical machine. In 1709 he published his 'Physico-Mechanical Experiments on various subjects; touching light and electricity producible on the attrition of bodies,' London, 4to., which was shortly after translated into Italian by Thomas Derham. The work was also translated into French by M. Bremond, but the latter having died before completing the translation, the publication was delayed till 1754, when it was revised and edited by M. Desmarest, who added the more recent discoveries of Hawksbee, and the yet more important ones of Mr. Gray. In addition to the works already mentioned, Hawksbee has left 'Proposals for a Course of Chemical Experiments,' London, 1731, 4to.; 'An Essay for introducing a Portable Laboratory,' London, 1731, 8vo.; besides numerous papers on various philosophical subjects in the Society's 'Transactions.'

HAUTEFEUILLE, JEAN DE, a French mechanic, was born at Orleans, March 20, 1647. His father, who was a baker, being accustomed to supply with bread the master of the house at which the Duchess of Bouillon then resided, prevailed upon this person to recommend the youth to the notice of that lady. The duchess having consented to see him, an interview took place, when the lady was so well satisfied with the young man that she engaged to pay the expense of his education; and, on his entering into the ecclesiastical state, she retained him in her service. He never after quitted his benefactress, who conferred upon him several benefices, and at her death she bequeathed to him a pension.

The Abbé Hautefeuille, such was his designation, devoted himself to the study of subjects connected with physical science, and to the construction or improvement of instruments; but he is distinguished chiefly by the claims which he advanced in 1675 to the honour of having invented a spring-balance for watches. This contrivance consisted of a straight spring of steel which he applied so that it served to regulate the movements. About the same time Huyghens invented for the like purpose, a spring, which he made of a spiral form: it happened however that Hautefeuille had communicated his invention to the Académie des Sciences of Paris in the preceding year; therefore when Huyghens applied to the French Government to be allowed the exclusive privilege of using it, he was opposed by Hautefeuille, and he subsequently withdrew his application. It is remarkable that Dr. Hooke had, about the year 1658, invented a balance-spring for watches, but he spent several years in improving his escapement, and his watches were not made public till about the same year that the inventions of Hautefeuille and Huyghens were in use in Paris.

The other inventions, or rather projects of Hautefeuille are numerous, but few of them appear to have been brought to perfection. He published in 1692, at Paris, a work entitled 'Recueil des Ouvrages de M. de Hautefeuille,' which contains an explanation of the effects of speaking-trumpets; an account of a pendulum clock in which the weight was to be raised by the action of the atmosphere; a method of raising water by means of fired gunpowder; and an account of some improvements in telescopes in which the field of view was to be increased by means of a concave mirror; also some observations on machines for raising water; a description of a pump which was to act without friction; and an account of a contrivance for mounting telescopes of great length.

Hautefeuille published a method of defining the declination of a magnetic needle (1633); an account of a magnetic balance (1702); with accounts of a micrometrical microscope, and of an instrument for observing the altitudes of celestial bodies. He also published, in 1719, a work entitled 'Nouveau Système du Flux et Reflux de la Mer,' in which the phenomena of the tides are made to depend upon a parti-

cular motion which he ascribes to the earth; but the best of his works is his 'Dissertation sur la Cause de l'Écho,' which had been read before the Academy of Bordeaux in 1718, and was published in that city in 1741.

Hautefeuille appears to have been in haste to publish his ideas as soon as they arose in his mind, without waiting to put them to the test of experiment; and consequently most of his projects are crude conceptions which have not led to any object of practical utility. The opinion entertained of him by his countrymen is manifest from the fact that he was never admitted a member of the Académie des Sciences, though he ardently desired that honour. He died October 18, 1724, being then seventy-seven years of age.

HAÛY, RENÉ-JUST, ABBÉ, a distinguished French mineralogist, was born February 23, 1743, at St. Just, in the present department of Oise. He commenced his studies at the college of Navarre, to which college he was appointed professor in 1764, and subsequently also to that of the Cardinal Le Moine. His attention was first drawn to the subject of mineralogy by attending the lectures of M. Daubenton, but the accidental fracture of a beautiful specimen belonging to his friend M. France de Croisset is said to have led him to the discovery of the geometrical law of crystallisation. Haüy was anxiously employed in collecting the scattered fragments of the crystal which he had broken, when M. Croisset, whom the accident had rendered almost inconsolable, desired he would not give himself that trouble, and directed a domestic to remove the pieces, which, in his own opinion, were no longer of any value. But Haüy, who regarded them with extreme attention, requested permission to remove them himself, remarking that the conformity of the superposed plates of crystalline matter with the planes of the central prism or nucleus had revealed to him a secret which he wished more fully to explore. From this moment he applied himself sedulously to the development of the truth which his genius had detected, and his efforts were rewarded with the success they merited. He was the first to show that the structure of crystalline substances was regulated by laws as invariable as those to which organised bodies are subjected, and thus crystallography for the first time assumed the character of a regular science. His theory rests upon the supposition that all the crystalline forms belonging to any single species of mineral are derivable from some one simple form which may be regarded as the type of the species; it likewise supposes that the angles at which the planes of crystals can be inclined to each other are confined within certain limits, an erroneous supposition which may probably be attributed to the imperfection of the instruments employed to measure them. In compliance with the request of Messrs. Daubenton and Laplace, Haüy communicated the result of his researches to the Royal Academy, and was elected a member of that society in 1783.

During the Revolution he was thrown into prison for refusing to take the oath of obedience required of the priest, but the exertions of Geoffroy Saint-Hilaire, one of his pupils, and the remark of a citizen, that "it were better to spare a recalcitrant priest, than to put to death a quiet man of letters," obtained his release, and probably saved his life. In 1794 he was appointed conservator of the mineralogical collections of the School of Mines, and the following year he received the appointment of secretary to the commission of weights and measures. Under the consulship of Napoleon he became professor of mineralogy at the Museum of Natural History, and professor of the Faculty of Sciences at the Academy of Paris. Haüy died at Paris, June 3, 1822. Besides numerous memoirs upon mineralogy and electricity, inserted in the 'Journal des Mines' and the 'Annals of the Museum of Natural History,' he has left the following works:—'An Essay on the Structure of Crystals,' 1 vol., 1784; 'Exposition of the Theory of Electricity and Magnetism,' 1 vol.; 'Treatise on Mineralogy,' 4 vols., 1822; 'Treatise on Physics,' 2 vols., 1821; 'Treatise on Crystallography,' 2 vols., 1822; and some others.

HAVERCAMP, SIGEBERT, was born at Utrecht in 1683. He studied philology at Leyden under Gronovius, whom he succeeded as professor of Greek. He was also appointed afterwards professor of history and eloquence. He died on the 25th of April 1742.

Havercamp edited many of the classical writers with numerous notes, which were principally selected from former commentators. Of these the most important are 'Tertulliani Apologeticus,' 8vo, Leyd., 1718; 'Lucretius,' 2 vols., 4to, Leyd., 1725; 'Josephus,' 2 vols., fol., Amst., 1726; 'Eutropius,' 8vo, Leyd., 1729; 'Orosius,' 4to, Leyd., 1738; 'Sallust,' 2 vols., 4to, Amst., 1742; 'Censorinus,' 8vo, 1743. He was also the author of many original works, of which the most important are, 'A Universal History,' fol., 1736, in Dutch; 'Introductio in Historiam Patriæ à primis Hollandiæ comitibus,' 8vo, Leyd., 1739; 'Sylloge scriptorum qui de lingua Græcæ veræ et recta pronuntiatione commentaria reliquerunt,' 2 vols., Leyd., 1736-40; 'Dissertationes de Alexandri Magni Numismate,' 4to, Leyd., 1722; 'Thesaurus Morellianus,' 2 vols., fol., 1734; 'Introductio in Antiquitates Romanas,' 8vo, Leyd., 1740. The list of Havercamp's writings shows that he was a laborious scholar; but many of his works bear traces of having been written in a hasty and careless manner.

HAWES, STEPHEN, author of 'The Pastime of Pleasure,' lived at the beginning of the 16th century, but the date of his birth and death are alike uncertain. He calls himself "gentleman and grome of the chamber to the famous Prynce and seconde Salomon, Kyng

Henry the Seuenth." He was a native of Suffolk, and refers in his poems to Lydgate as his master. His accomplishments made him a favourite with Henry VII., who had some taste in literature, particularly French, in which Hawes's travels had given him uncommon skill, and poetry such as that of Lydgate and Chaucer, in the repetition of which Hawes was a great proficient.

His 'Pastime of Pleasure' is an allegorical poem, "containing the knowledge of the seven sciences and the course of Man's life in this world." Grand Amour goes through the town of Doctrine, where he meets the Sciences, becomes enamoured of La bell Pucel, whom he marries, and with whom he spends his life. It is by courtesy to metre, and scarcely for any other cause, that we call 'The Pastime of Pleasure' a poem. It seems to belong to that period when the epic element (the poetry of action) had been worn out, but having long held undisputed sway in the romances, as action itself had in real life, compelled those who lived in a more thoughtful and therefore lyrical age to clothe their reflective poetry in an epic dress.

Another poem, 'The Temple of Glas,' is ascribed to Hawes, but there are almost equally strong reasons for believing it to be Lydgate's, as Hawes himself tells us that Lydgate composed a work under that name, and there is something about the run of the verses which reminds us rather of Lydgate than of Hawes.

HAWKESWORTH, JOHN, LL.D., was a successful writer of the last century. The date of his birth (1715 or 1719) and the occupations of his early life are variously stated: in so short a notice, all that is essential to record is, that he was bred to some mechanical occupation, and therefore deserves the more credit for his talent and industry in supplying the defects of a rude and illiterate education. His first appearance was as a contributor to the 'Gentleman's Magazine,' in which he succeeded Dr. Johnson as compiler of the parliamentary debates in 1744. In 1752, encouraged by the success of the 'Rambler,' he undertook, assisted by Johnson, Warton, and one or two others, a series of essays, called the 'Adventurer.' They extended to the number of 140 (70 of which are ascribed to Hawkesworth himself), were received with great approbation, and contributed much to the increase of his reputation and friends. Herring, archbishop of Canterbury, was so much pleased with the work, that he procured a degree in civil law for the conductor. In 1761 he published an edition of Swift, with a life prefixed, to the merits of which Dr. Johnson has borne handsome testimony in his 'Lives of the Poets.' On the return of Capt. Cook from his first voyage of discovery in the South Seas, it being thought desirable to entrust the task of compiling an account of the voyage to a literary man rather than to one of the travellers, Dr. Hawkesworth's reputation as an able writer obtained for him the commission. He completed the task in three vols., 4to., 1773 [Cook], illustrated with maps and plates at the expense of government, including the prior voyages of discovery of Byron, and of Wallis and Carteret, and received for recompense the liberal sum of 8000*l*. The work however did not give satisfaction: the warmth of his descriptions of manners, in some respects, was thought to verge upon immorality; and exceptions were taken to some religious speculations, which were at any rate very much out of place. The chagrin occasioned by these censures is said to have shortened the author's life, but as he died in November of the same year, the statement is probably incorrect; the effect of criticism on a practised author is seldom so rapid and deadly. The accounts of Cook's subsequent voyages were written by Cook himself, and gained more in simplicity and correctness than they lost in literary elegance. Dr. Hawkesworth translated 'Telemachus,' and wrote 'Almorán and Hamet,' an eastern romance, which was much admired. He was a regular contributor to the 'Gentleman's Magazine.' He was a great imitator of the style of Johnson, but he wanted depth and range of thought to support his weighty words.

HAWKINS, SIR JOHN, a distinguished seaman of the reign of Elizabeth, was born at Plymouth, about 1520. His youth was spent in trading to Spain, Portugal, and the Canaries; and the information and experience which he thus obtained made him well aware of the gain to be derived from supplying the Spanish colonies with slaves from Guinea. With the assistance of some merchants, he fitted out a small squadron in 1562, and obtained, partly by purchase, partly by force, a cargo of 300 negroes, whom he carried to Hispaniola, and there sold. This, we believe, was the first adventure of Englishmen in that inhuman traffic. He made a second voyage in 1564, and a third in 1567: the latter turned out unfortunately. All trade between the Spanish settlements and foreigners being prohibited by the mother-country, though often, from interested motives, connived at by those in power, he was at last attacked by the Spanish authorities in the port of S. Juan de Ulloa, and saved but two ships of his squadron, with which, after suffering great hardships, he returned to England in January 1563. This seems to have been his last commercial enterprise. The queen's approbation of his services, and sanction of that abomination, which, after the lapse of more than two centuries, the tardy voice of Europe has branded as piracy, was conveyed in the expressive grant to wear at his crest "a demy-moor in his proper colour, bound with a cord." In 1573 Hawkins was appointed treasurer of the navy. In 1588 he served as rear-admiral against the Spanish armada [see notice of the Armada under ELIZABETH]; and his bravery on this occasion was rewarded by Elizabeth with the honour of knight-

lood. Being sent with Frobisher in 1590 to intercept the Plate fleet and harass the trade of Spain, he failed in the first object, but succeeded in the second. In 1595 he was appointed, jointly with Drake, to command a more important expedition against the Spanish settlements in the West Indies. The enterprise proved fatal to both these hitherto successful commanders. They disagreed upon the conduct of operations, and soon separated. [DRAKE.] Hawkins died November 21, 1595, chiefly, it was supposed, through annoyance and agitation; and Drake expired in the following month. Sir John Hawkins sat in parliament for Plymouth, and founded an hospital at Chatham for poor and sick seamen.

HAWKINS, SIR JOHN, the senior of the two chief historians of music, the friend and executor of Dr. Johnson, and a descendant of the Sir John Hawkins who commanded the Victory, as rear-admiral, at the destruction of the Spanish armada, was born in 1719. His father, a surveyor and builder, at first brought his son up to his own profession, but eventually bound him to an attorney, "a hard task-master and a penurious housekeeper." At the expiration of the usual term, the clerk became a solicitor, and succeeded in establishing himself in a respectable business, while by his character and acquirements he gained admission into the company of men eminent for their accomplishments and intellectual attainments. He was an original member of the Madrigal Society, and at the age of thirty was selected by Mr. (afterwards Dr.) Johnson as one of the nine who formed his Thursday-evening Club in Ivy-lane. About this time he contributed much to the *Gentleman's Magazine*, and other periodicals of the day. He also wrote the poetry of the cantatas set by the blind composer, Stanley, from which he derived considerable profit.

In 1753 Mr. Hawkins married Sidney, the second daughter of Peter Storey, Esq., with whom he received an independent fortune, which was greatly augmented in 1759 by the death of his wife's brother, and he in consequence retired from all professional avocations. Upon retiring from the law Mr. Hawkins purchased a house at Twickenham; and being in 1771 inserted in the commission of the peace for the county of Middlesex, he immediately became a most active magistrate. Among other useful acts, he wrote 'Observations on the state of the Highways, and on the Laws for amending and keeping them in repair;' subjoining the draft of a bill which passed into law. In 1764 he successfully opposed the attempt made by the corporation of London to throw on the county two-thirds of the expense of building the gaol of Newgate. For this service he was, in 1765, elected chairman of the Middlesex quarter sessions. When the riots at the Brentford election took place in 1768, he was active in their suppression; and the dispersion of the Spitalfields weavers in 1769, who had collected in a threatening manner, is mainly ascribed to his decision and boldness. For these services he received, in 1772, the honour of knighthood.

Sir John Hawkins now set seriously about finishing the work he had for some time projected on the 'History of Music.' He went to Oxford, and there remained for some time, to examine the books in the Bodleian and other libraries, connected with his inquiry. He was accompanied by an artist, whom he engaged to make drawings of the portraits in the music-school, all of which were engraved for his History. He also consulted all the eminent living musical authorities. In 1776 appeared, in five quarto volumes, the work on which he had been sixteen years engaged, under the title of 'A General History of the Science and Practice of Music,' which he dedicated to George III. Its reception by the public was worse than cold. Its research and accuracy were indeed obvious to those qualified to form an opinion on the subject; but five large volumes were alarming to the public, and he closed it at the death of Handel, leaving untouched those matters in which the living many were most interested. Moreover, on the appearance of the History, Sir John was immediately attacked in the 'St. James's Evening Post,' by Stevens, the commentator on Shakspeare, in a very virulent manner; and literary men generally joined in depreciating it. Subsequently it was assailed by the ridicule of Dr. Lawrence, in the 'Probationary Ode.' The consequence of these persevering efforts to destroy a useful, though ill-written and excessively tedious history, was, that it fell nearly dead from the press. The work however now fetches a price beyond that at which it was published; is found in every musical library; and is a very serviceable book of reference.

While pursuing his historical inquiries, Hawkins accumulated a fine musical library; and it was his good-fortune to become possessed, by purchase, of several scarce and valuable theoretical treatises on the science itself, which were collected by the celebrated Dr. Pepusch, F.R.S. This collection he, after the completion of his work, presented to the British Museum, where it remains.

In 1760 Hawkins published his edition of Walton's 'Angler,' with notes, of which three or four editions have since appeared. On the death of Dr. Johnson, in 1784, Sir John undertook, in consequence, it is supposed, of some conversation between them, to write the life of his friend, and to become editor of a complete collection of his works. In this task, as in his 'History of Music,' it was his fate to meet with unexpected competition and severe criticism. But he had scarcely entered on the work when his whole library—a library which no expense could replace—was destroyed by fire. In 1787 he closed his literary career, by the publication of his 'Life of Dr. Johnson,'

and an edition of his works—a task for which he was wholly unqualified. In May 1789, Sir John Hawkins suffered a paralytic attack, which from the first was considered of a fatal nature. It increased on the 21st of the same month, when he expired. His remains lie in the cloisters of Westminster Abbey. He left two sons and one daughter. The latter is well known in the literary world: she wrote, among other things, some dull and pompous novels, and some ludicrously patronising and querulous 'Anecdotes' of Dr. Johnson, which are inserted in her 'Memoirs,' 2 vols. 8vo, 1827.

HAWKSMOOR, NICHOLAS, the architect of many buildings of note in the early part of the 18th century, was born in 1666, and at the age of seventeen became the pupil of Sir Christopher Wren. Beyond this we possess very few personal details relative to him. His works, if they do not display a very refined taste, give evidence of talent and a certain degree of originality. Like that of Vanbrugh, with whom he is said to have been associated both at Blenheim and Castle Howard, his style partook of the massive and heavy, combined with a certain coldness and baldness. Of this we have proof in the church of St. George's in the East, Ratcliffe Highway, commenced by him in 1715, which is no less ponderous in its ensemble than hard and dry in its details, besides being extravagant and anomalous. That of St. Mary Woolnoth's in Lombard-street is very much better; there is a certain degree of originality, richness, and picturesque character in the north side, which, until alterations made a few years back, was the only one exposed to view. The interior, which is lighted chiefly by a square dome or lantern extending over the centre above three Corinthian columns at each angle, and having a large semi-circular window on each of its sides, is one of the best specimens of church architecture of that day, though the effect is greatly impaired by the pewing and galleries. But it is chiefly as the architect of St. George's, Bloomsbury, that Hawksmoor is entitled to notice, that being a work which of itself ought to confer a lasting reputation. It is true, Walpole has stigmatised the steeple as "a masterstroke of absurdity," and adopting that smartly expressed opinion others have continued to repeat his censure. It is however, in the style to which it belongs, one of the happiest as well as most original in its idea; picturesque and graceful in outline; well combined together; consistent though varied; with a due expression of solidity, remote from heaviness on the one hand, and on the other from that species of lightness which, though a merit in Gothic, becomes a fault in Roman architecture. One leading fault imputed to this steeple is that it is surmounted by a statue of George II., which gave rise to an epigram that had perhaps quite as much influence in exciting a prejudice against the structure as Walpole's dictum. Yet, apart from the question of the good taste or propriety of so decorating the leading feature of a building dedicated to religious worship, if there be any inconsistency or absurdity in terminating the steeple by a statue, it is at least equalled by that of erecting a column, for no other purpose than to elevate a statue upon it: because in the latter case the figure, though put almost out of sight, is presumed to be the principal object, while in the other it is intended to be no more than an ornamental accessory and termination to the structure. The portico of this church, which is, like that of St. Martin's, a hexastyle Corinthian, is very little inferior to it in execution, and displays itself still more advantageously, being considerably raised above the street by a flight of steps, enclosed by pedestal walls, which gives it an air of considerable dignity. St. Anne's, Limehouse, is another church by Hawksmoor, which deserves more praise than has fallen to its share; and it has the advantage over St. George's, Bloomsbury, in having a more decidedly ecclesiastical character. With much that is incorrect, and with very little that is positively beautiful, its ensemble has an air of grandeur frequently missed where it seems to have been more studiously aimed at.

Among his other works were Easton Neston, in Northamptonshire, and a mausoleum at Castle Howard. He was also employed to repair the west front of Westminster Abbey. The south quadrangle and street front of Queen's College, Oxford, have by some been attributed to him, though they are generally supposed to have been the work of Wren. That he did much at All Souls College, in the same university, is unquestionable, and Dallaway informs us that he had seen a very grand design by him for rebuilding Brazenose College, somewhat in the style of Greenwich Hospital, where he had at one time the appointment of clerk of the works. Besides this he gave a design for the Radcliffe Library, but that of Gibbs obtained the preference. He died in March 1736, at the age of seventy.

* HAWTHORNE, NATHANIEL (the name properly being HATHORNE), American author, born at Salem, Massachusetts, about 1809. He was contemporary with Longfellow at Bowdoin College, and graduated as early as 1825. His earliest literary productions, contributed to various periodicals, were collected in two series, under the title of 'Twice-told Tales,' in 1837 and 1842. After this, in 1843, his habits of retirement led him to occupy a mysterious residence, some particulars of which he has given in 'Mosses from an Old Manse,' published in 1845. In the same year he edited the 'Journal of an African Cruiser.' At this period Mr. Hawthorne held a position in the Custom House, Boston, whilst that department was under the charge of Mr. Bancroft, and his situation here forms the introduction to 'The Scarlet Letter,' published by him in 1850. In this work is shown a deep knowledge of human nature, but so

intermingled with the fancies of a wild imagination as to be most unreal, and to leave the reader in doubt as to what the author does know and feel. In the following year Mr. Hawthorne wrote some juvenile books—'The Snow Image,' 'Collected Tales,' and 'True Stories from History and Biography'; also 'The House of the Seven Gables,' a work which divides his fame with 'The Scarlet Letter,' and has precisely the same characteristics of style. Some years previously Mr. Hawthorne had joined the singular enterprise of a few literary colonists calling themselves the Brook Farm Community, a society proceeding on ideas in some measure suggested by or derived from the doctrines of Fourier. They "sought the better life" in tilling the fields, and found them harder than society itself. Mr. Hawthorne's experiences, again coloured by an active imagination, were given to the world in 1852, in 'The Blithedale Romance,' in which it is easy to trace characters resembling Mr. Hawthorne, Mr. Dana, and the late Margaret Fuller Ossoli. He also published a 'Life of General Pierce,' and 'A Wonder Book,' a second series of which, called 'Tanglewood Tales,' was published in 1853. On the accession of General Pierce to the presidency in 1852, Mr. Hawthorne was appointed consul for the United States at Liverpool; but in England, although his writings are extensively read, the author is very little known. This is entirely owing to a modest and retiring temperament, avoiding anything like publicity or homage.

* HAY, DAVID RAMSAY, is the author of some able works on decoration, and on the principles of form and colour applicable to various branches of art. Engaged at Edinburgh in the business of house-painting, he is one of the very small number of persons following a commercial pursuit connected with building, who may claim to rank as artists—art involving the exercise of original mind and the power to discover and unfold the beautiful in various forms and new relations. Mere house-painting not only requires greater manual skill and chemical knowledge than are ordinarily given to it, but it may be properly regarded as an art, like those higher branches called painting and sculpture.

Mr. Hay was born in Edinburgh in the year 1798. His father dying young, his mother and her family were left wholly unprovided for. He had however the good fortune to be named after a kind friend of the family—the proprietor of the 'Edinburgh Evening Courant'—through whom he received sufficient education to be enabled to act as a 'reading-boy,' with the view of being ultimately bred to the printing business. This employment however did not suit Mr. Hay's taste; he was often caught pencil in hand; and after having several times incurred the displeasure of the foreman for interfering with his love of drawing the boys of the establishment, the young artist, with his benefactor's sanction, at the age of fourteen, left the printing-office, and engaged himself as an apprentice to Mr. Gavin Bengo, a house-painter in Edinburgh. There he learned the rudiments of the trade. He then set to work painting and copying pictures. One of his productions meeting the eye of Mr. (afterwards Sir Walter) Scott, the latter engaged him to paint a portrait of his favourite cat. Scott was pleased with the production, kindly interested himself in the artist, and often talked with him about his (Mr. Hay's) prospects in life: the result was that, by Scott's advice, Mr. Hay devoted his abilities to decorative house-painting rather than to a field of greater ambition. The story has been often told, and Scott's opinion quoted as applicable to art-education, which, as afforded in schools of design, there was at one time an apprehension might tend to the production, in place of superior art-workmen, of inferior painters and sculptors. Scott, as inducement, promised his *protégé* the painting of the house at Abbotsford, then building; and by the same advice Mr. Hay joined with Mr. William Nicholson, a portrait-painter, but who was also connected with the house-painting business. In 1824 the decoration of Abbotsford was commenced under Scott's own supervision, and not according to present principles of taste. In 1828 (about which time he began business on his own account) Mr. Hay published his first work, entitled 'The Laws of Harmonious Colouring,' &c., a work which has gone through six editions, the last, in 1847, being in fact a new work, with a section on 'The Practice of House-Painting.' The work has the merit of priority in the exposition of much of the science of colour, to which increased attention has been called by recent writers. During the progress of the editions referred to, and since, Mr. Hay has not only given his time to the duties of an extensive business, but has prosecuted with arduous theoretical inquiries in varied fields. In 1842 he published 'The Natural Principles and Analogy of the Harmony of Form'; in 1843, 'Proportion, or the Geometric Principle of Beauty Analysed'; in 1844, 'An Essay on Ornamental Design, in which its true principles are developed and elucidated,' &c.; in 1845, 'The Principles of Beauty in Colouring Systematised'; in the same year the first edition, and in 1846 the second edition, of 'A Nomenclature of Colours,' wherein he gives upwards of 200 examples of colours, and their various hues, tints, and shades; in 1846 also he published 'First Principles of Symmetrical Beauty'; in 1849 he issued a work 'On the Science of those Proportions by which the Human Head and Countenance, as represented in Ancient Greek Art, are distinguished from those of Ordinary Nature'; in 1851, 'The Geometric Beauty of the Human Figure Defined,' to which is prefixed 'A System of Æsthetic Proportion applicable to Architecture and the other Formative Arts'; in 1852,

'The Natural Principles of Beauty as developed in the Human Figure'; in 1853, 'The Orthographic Beauty of the Parthenon referred to a Law of Nature,' to which he has prefixed 'A few Observations on the Importance of Æsthetic Science as an Element in Architectural Education'; in 1855, 'The Harmonic Law of Nature applied to Architectural Design'; and in 1856, 'The Science of Beauty as developed in Nature and applied in Art.' These works are all illustrated, in some cases profusely, and have been most favourably received. In connection with the practical process of house-painting, Mr. Hay has made several improvements. The decorations of the meeting-hall of the London Society of Arts were designed and executed by him about the year 1846.

HAYDN, JOSEPH, the father of modern orchestral music, the most original and imaginative of composers, was born at Rohrau, about 15 leagues from Vienna, on the 31st of March 1732. His parents were humble; his father was a small wheelwright, and his mother, previous to her marriage, was cook to the lord of the village; but both, true Austrians, were musical. The former had a fine tenor voice, and could play on the harp, the latter sang, and, with the aid of a relation, they got up little concerts on Sunday afternoons, in which the young Haydn, when five years of age, pretended to join them with two pieces of wood cut in imitation of a violin and bow. The accuracy with which his motions kept time with the domestic music attracted the notice of a cousin, a schoolmaster at Haimburg, and a good musician, who made an offer, which was readily accepted, to take the child into his house as a scholar. Under the friendly roof of that kinsman he learned music as an art, soon became capable of using a real violin, and acquired some knowledge of Latin. He was also taught to sing in the parish church, where he was heard by Herr Reuter—kapellmeister of the cathedral of St. Stephen at Vienna, who was travelling in search of boys for the use of his choir—and immediately engaged as a chorister in the metropolitan church of the empire.

Under Reuter, Haydn continued till he arrived at the age of thirteen, practising almost incessantly, but receiving only such instructions from his master as qualified him for the duties of the choir. At that period, failing, for want of sufficient knowledge, in an attempt at composition, and being destitute of the means of obtaining the assistance of a master, he contrived to procure the well-known treatise on counterpoint by Fuchs, with one or two other works on the theory of music, by means of which, and his own indefatigable industry, he speedily surmounted the first difficulties encountered by a youthful composer. He now made himself known to the famous Porpora, who was living in the hotel of the ambassador from Venice, and by very assiduous attentions to the old musician gained much knowledge from him, particularly in singing, in which he made such progress that the ambassador having heard him took him into his service, and bestowed on him a trifling salary. But at the age of seventeen his soprano voice left him, and with it fled the present means of living. His father could render him no assistance, and, sorely distressed, he was offered an asylum in the house of Keller, a wig-maker, who had often been charmed by his vocal powers. The hospitality was accepted, and Haydn was in obscurity enabled to pursue his studies. But his residence with the friendly tradesman powerfully influenced his future domestic life. Keller had a daughter, who was offered to the young musician in marriage. He gave his promise to her, which after a time he honourably fulfilled; the union however did not contribute to the happiness of either party, and ended in a separation not very long after it had taken place.

By giving a few lessons in music, and occasionally performing in the orchestra for what he could get, Haydn supplied himself with absolute necessities; and frugality being one of the German virtues, he managed to preserve a tolerably decent appearance till fortune first began to smile on him, by leading him into the house of the Abate Metastasio, where he gave instructions to the poet's niece, and gained not only a thorough acquaintance with the Italian language, but a general knowledge of literature, and the most useful advice on the subject of setting words to music, from the imperial laureate. This connection also introduced him to the Count Martzin, a noble patron of music, into whose service he entered in 1759; and hence, in 1761, he passed into that of the rich Prince Esterhazy, to whom he remained attached, as Maestro di Capella, to the end of his life.

Comfortably settled in the palace of Eisenstadt, in Hungary, enjoying in moderation his favourite diversions of hunting and fishing, and relieved from care for the future, Haydn there composed all the great works which he produced prior to the year 1791, and under advantages which few, if any, have possessed: he had a full choice band, living under the same roof with him, at his command every hour in the day; he had only to order, and they were ready to try the effect of any piece, or even of any passage, that, quietly seated in his study, he might commit to paper. Thus at leisure he heard, corrected, and refined whatever he conceived, and never sent forth his compositions till they were in a state to fearlessly challenge criticism.

We now arrive at that period in the life of Haydn in which were produced most of those works that have raised his fame to the high point it has attained. In 1790 Salomon, the celebrated violinist, having determined to give a series of subscription concerts in London,

went to Vienna to engage either Haydn or Mozart, not only to produce certain compositions in aid of his design, but to superintend in person the performance of them. It was mutually agreed by the three parties that Haydn should be the first to visit London, and that Mozart should follow the year after; but it was destined that the latter should not live to fulfil his part in the agreement. In 1791 Haydn arrived, and produced during that and the following year, at 'Salomon's Concerts,' in the Hanover-square Rooms, six of his 'Twelve Grand Symphonies,' which immediately made an extraordinary sensation in the musical world, and have ever since rather increased than diminished in public estimation. Here also he composed, by agreement with Corri and Dussek, music publishers, his two sets of English canzonets, which for originality, for musical expression of every kind, and for richness and propriety of accompaniment, have no rivals. Besides these, his prolific imagination gave birth to many quartets, sonatas, &c.

In 1794 Haydn accepted a second engagement from Salomon for the same purpose. He reached London in January, and in the course of that and the succeeding season brought forth the remaining six of his Grand Symphonies, with the same brilliant result. For these twelve symphonies, and for superintending their performance, he received a sum—including two benefit concerts, the profits guaranteed by Salomon—amounting to 1550*l.* To this is to be added, as the fruits of his visits to England, what he gained by his canzonets and other compositions: it was therefore with reason he declared that in London he discovered the real value of the reputation he enjoyed in Germany. His reception here was of the most flattering kind: the University of Oxford conferred upon him the degree of Doctor in Music; at the tables of the Prince of Wales and the Duke of York he was a frequent guest; and nearly all classes vied in showing him attention. The satisfaction which he felt he gratefully acknowledged and evinced in a diary he kept while in England, a translation of a part of which (a curious document), with notes, appears in the fifth volume of the 'Harmonicon.'

In 1798 Haydn gave to the world his oratorio 'The Creation,' the greatest of his works, though composed in his sixty-fifth year. It is enough to say of this fine production of his advanced years, that it is not unworthy to rank with the finest oratorios of Handel. The design was suggested, his biographer M. Beyle tells us, by an English gentleman named Lidley (Liddell, we suspect, is the true name). The German text however, and the barbarous English translation (which to our shame is still in use), were furnished by the Baron von Swieten. Two years after this he composed 'The Seasons,' a work of little less originality than 'The Creation,' but not exhibiting, nor intended to exhibit, the same depth of thought. The subject is not of so grave a nature, and is treated with more freedom. The last offsprings of his genius were two sets of quartets, "which betray no abatement of his vigour; on the contrary, the second of his Op. 80 is perhaps the most original and exquisitely finished of all the works of the kind that ever proceeded from his pen."

When Haydn's 'Creation' reached Paris the Institut National elected him a member, an honour contested with him by some of the greatest men of the time in Europe; and honours and marks of the highest respect flowed in upon him during his remaining years from all the leading societies and musical professors of Europe. His death is supposed to have been accelerated by the bombardment of Vienna, which powerfully agitated his weakened frame, though it must be mentioned, to the honour of Napoleon, that he issued strict orders that the abode of Haydn should be respected; and when the troops entered the city, a French guard was placed at his door to protect him from every kind of injury. He died on the 29th of May 1809, and was privately buried at Gumpendorff, his country then suffering all the horrors of war, and the capital of the empire being in possession of the enemy. He left no children. His works are astonishingly numerous, embracing every class. Among them are 116 symphonies, 83 violin quartets, 60 pianoforte sonatas, 15 masses, 4 oratorios (including the 'Seven Last Words'), a grand Te Deum, a Stabat Mater, 14 Italian and German operas, 42 duets and canzonets, upwards of 200 concertos and divertissements for particular instruments, &c. &c. Many of these, but not the most valuable, were irretrievably lost in the fire which consumed the palace of his patron at Eisenstadt: the best are out of the reach of danger; they have been printed and reprinted in half the capitals of Europe.

HAYDON, BENJAMIN ROBERT, was born January 25th 1786 at Plymouth, where his father was a bookseller. Haydon was educated first at the Plymouth grammar-school and afterwards at the Plympton grammar-school, where Sir Joshua Reynolds had received his education. Haydon's father drew a little himself, and had a taste for art, and was delighted with his son's skill in drawing; but he wished him, as there was no other son, to adopt his business, and Benjamin was accordingly apprenticed. But the youth hated the business, and expressed his resolution to become a painter so determinedly, that after much opposition his father consented, and in May 1804 he started for London. Through Prince Hoare, a friend of the family, he got introductions to Northcote and Opie, and afterwards to Fuseli, keeper of the Royal Academy, by whom he was readily admitted as a student at the Royal Academy; and thus at the age of eighteen, an enthusiast for Raffaele, Michel Angelo, and high art, Benjamin Haydon commenced his career.

Here he drew with great earnestness, and soon acquired great readiness of hand. He also spent much time in dissecting and the study of anatomy generally, of which he obtained a very fair amount of knowledge. But his studies were too desultory and interrupted, and there can be little doubt that the weakness of his sight—he had while a youth been for a short time quite blind—was a great hindrance to successful study in both form and colour. At the academy, Wilkie, Jackson, and others subsequently famous, were his fellow-pupils, yet he seems to have been generally regarded as one of the most promising students in the institution, while he was a great favourite with his companions there.

Haydon exhibited his first picture at the Royal Academy in 1807. The title alone will show the daring of the young painter, 'Joseph and Mary resting with our Saviour after a day's journey on the road to Egypt.' Mr. Hope, author of 'Anastasis,' became the purchaser of this picture. The reputation which the artist gained by it gave him increased energy and ambition. 'Dentatus' was the subject chosen by him next year; and from this period Haydon dates the commencement of a quarrel with the Royal Academy, whom he accused of illiberality or mismanagement in hanging his 'Dentatus' where it could not be seen, and of a fear of historical painting as the cause of their refusal to admit him as an associate, while they admitted less skilful artists. The 'Dentatus' was purchased by Lord Mulgrave, and in the following year was exhibited in the British Institution, where it received the praises of the public, and the prize of the committee. About this time the Elgin Marbles were first exhibited in London, and Haydon's enthusiasm about them was boundless. For a time he did scarce anything but draw, write, and talk about them; and to the last he was glad to believe that to his earnest pleas with men in power the purchase of them for the nation was partly due.

Haydon now got diverted from steady application to painting by his fondness for controversy; and the attacks he published on the Royal Academy, by estranging from him some personal friends among artists and the patrons of art, greatly exasperated his temper, and there can be little doubt produced a lasting ill effect on his fortunes. From this time his life was to a great extent one of strife, and of constant struggle with pecuniary difficulties. Still he was at no time without friends. Sir G. Beaumont gave him a commission for a subject from Macbeth, and his 'Judgment of Solomon' was bought by Mr. Elford and Mr. Tingcomb for 700 guineas; his 'Alexander returning in triumph, after vanquishing Bucephalus,' found a purchaser at 500 guineas in the Earl of Egremont; and his 'Venus and Anchises' was purchased for 200 guineas by Lord de Tabley. Another application for admission to the Academy resulted again in disappointment.

His next great work was 'Christ's Entry into Jerusalem,' begun in 1814, but not exhibited until 1820, when it formed part of an exhibition of his own in Bond Street. The picture did not sell, but this did not prevent him from painting 'Christ in the Garden,' and 'Christ Rejected.' In May 1821 he married. His 'Raising of Lazarus' was painted in 1823. About 1815 he began to receive pupils, his first being the Landseers—Edwin, Charles, and Thomas—and his purpose being "to form a school, and to establish a better and more regular system of instruction than even the Academy offered." With many drawbacks he made a good teacher, and some of our best living painters numbered among his pupils, but he was ill fitted to carry on such an institution with the necessary regularity. He also became connected with Mr. Elmes in the conduct of the 'Annals of the Fine Arts,' and that publication became a vehicle for constant attacks by him on the Royal Academy, and eulogies (probably by Mr. Elmes) on Haydon and his pupils. But the school could not so prosper, the writing brought in no money, and his painting, when not neglected, was not of a kind to find ready patronage. He got deeper and deeper into debt, and became an inmate of the King's Bench prison. Here he found a subject for a successful picture in the 'Mock Election,' which took place within those walls in July 1827. George IV. purchased this work for 500 guineas. Haydon followed up the subject in his 'Chairing the Members,' which was sold for 300 guineas to Mr. Francis of Exeter. He had previously regained his liberty with the assistance of friends. Another picture of the same period was his 'Pharaoh dismissing Moses after the Passover,' for which he obtained 500 guineas from Mr. Hunter, an East India merchant.

Haydon's next subjects, after making an unsuccessful attempt to obtain employment as a portrait painter, were 'The Great Banquet at Guildhall' at the passing of the Reform Bill, and 'Napoleon musing at St. Helena.' the former was considered a failure, but the other met with great success. 'The Duke on the Field of Waterloo' fell far short of this, both in merit and public estimation. Again in 1836 he became a prisoner for debt in the King's Bench, but after a time he was able to effect a settlement with his creditors. He now engaged with great zeal in lecturing on painting at various literary institutions in London and the provinces, and his lectures were everywhere attended with signal success.

The determination of the government to decorate the interior of the new houses of parliament with pictures opened a new and grand field before the imagination of Haydon. He had petitioned, written, and lectured in favour of so adorning our public buildings, and impressed with a very high notion of his own capacity for executing such works, his sanguine temperament never permitted him for a moment to doubt

that he would be one of the painters selected for the task. Accordingly, finding that fresco was the vehicle in favour with the authorities, he set himself to acquire mastery over the use of that material, and when the cartoon competition was summoned, he addressed himself eagerly to the preparation of a cartoon. The judges gave in their award however, and his name was not among the successful competitors, even of the third class. It was a death blow to all his hopes; and though he struggled bravely against the disappointment, he never really recovered the shock. His last works were 'Uriel and Satan,' 'Curtius leaping into the Gulf,' 'Alfred and the Trial by Jury,' 'The Burning of Rome,' and numerous repetitions of his 'Napoleon.' 'Alfred,' and 'The Burning of Rome,' were exhibited in 1846 at the Egyptian Hall. The exhibition failed, and added to the embarrassment of his pecuniary affairs. Haydon's mind now entirely gave way under his misery. He died by his own hand, June 22, 1846. It should be added that a post mortem examination showed that there had been long standing disease of the brain. He left a wife and family, for whom a public subscription was immediately got up. It is not a little to the honour of Sir R. Peel, that, at what was perhaps the most busy and exciting period of his parliamentary career, he had found time just five days before the painter's unhappy death, to think of the artist, to whom he inclosed a cheque for 50*l.* Haydon's 'Lectures' are almost his only contributions to literature. Considerable difference of opinion exists as to his merits as a painter. The exaggeration and hardness, which it must be admitted disfigured his general style, are ascribed to his early intimacy with and imitation of Fuseli, but unjustly; they are Haydon's own, the result partly of insufficient study, partly of incomplete artistic education, more of his peculiar physical temperament, and habit of working. But he had many merits, and he did much to raise the character of English art, and to extend an interest in and a love of it. For a fair, and far from partial review of the character of Haydon as a man and an artist, the reader is referred to the concluding pages of the third volume of Taylor's 'Life of Benjamin Robert Haydon,' 2nd ed., 3 vols., 1853.

HAYLEY, WILLIAM, best remembered as the friend and biographer of Cowper, during the end of the past and the beginning of the present century enjoyed a considerable reputation, less perhaps from his sterling merit as a poet, than from his combining a very respectable share of taste, talent, and devotion to art and literature, with an easy fortune, and a certain position in society. Of epitaphs and other occasional verses he was a frequent, willing, and elegant author; but the credit acquired by this ephemeral branch of composition is as fleeting as it is commonly excessive. Mr. Hayley was born at Chichester, in 1745, and studied in Trinity Hall, Cambridge, intending to practise as a barrister. Finding the law not to his taste, he settled on his paternal estate of Earham, in Sussex, in 1774, a name memorable by its frequent occurrence in the history of Cowper, with whom the proprietor became acquainted in 1792. Hayley died November 20, 1820. Of his numerous poetic works, the 'Triumph of Temper,' 1781, has been the most popular, probably in consequence of the domestic interest of the subject. The 'Essay on Painting,' 1778, and 'Essay on History,' 1781, addressed respectively to his friends, Romney the painter, and Gibbon, though really of little value, rank among his best productions. We may add, as the most important of his other numerous works, the 'Essay on Epic Poetry,' 1782; 'Life and Poetical Works of Milton,' 1794-99; 'Essay on Sculpture,' 1800, addressed to his friend Flaxman; 'Life of Cowper,' 1802. (*Life of Hayley*, by himself, 1823.)

HAYMAN, FRANCIS, R.A., perhaps the best historical painter in England before the arrival of Cipriani, was born at Exeter about the commencement of the 18th century. He was the scholar of Robert Brown, and was in early life much employed by Fleetwood, the proprietor of Drury Lane old theatre, and by Tiers, the proprietor of Vauxhall. He also made many designs for booksellers, the best of which are the illustrations to Sir Thomas Hanmer's 'Shakspere.' He was the first librarian to the Royal Academy. Among his brother artists he was highly esteemed as a jovial companion, and many anecdotes are recorded of his wit as well as geniality. He died from gout, increased if not induced by his convivial habits, in 1776. (*Edwards, Anecdotes of Painters, &c.; Somerset House Gazette*, 1824.)

HAZLITT, WILLIAM, the son of a Unitarian minister of the same name, was born at Maidstone on the 10th of April 1778. When he was five years old his father transferred the scene of his ministerial exertions to America, and remained with his family in the United States for two years. On his return to England the father became pastor of the Presbyterian congregation at Wem in Shropshire; and it is here that the work of Hazlitt's education was commenced. At the age of nine he was put to a day-school at Wem. Some letters written by him, between the ages of nine and twelve, which have been preserved, indicate a very forward mental development; and in addition to these specimens of private correspondence, there is a letter, which he published at the age of thirteen, in a newspaper, in defence of Dr. Priestley, which, if printed exactly as he wrote it, displays considerable knowledge as well as literary skill. In 1793 Hazlitt was entered as a student of the Unitarian college at Hackney, in order to be educated for his father's profession. But for this profession he had no liking; and he devoted himself, while at the college, principally to moral and political philosophy, comparatively neglecting theological pursuits.

He returned home in 1795, having determined, much against his father's wishes, to change his profession.

Hazlitt had from a very early age shown a love of pictures and a taste for drawing, and it was now determined that he should follow the profession of a painter. He commenced with great ardour and assiduity, continuing to cultivate metaphysics in his intervals of leisure. We are told by his son that the first rough sketch of the essay on the 'Principles of Human Action' was thus begun at the age of eighteen. In 1802 he visited Paris for the purpose of studying the paintings in the Louvre; and on his return to England in the next year he made a professional tour through some of the midland counties and the manufacturing towns, and painted a considerable number of portraits; but he did not persevere. His notion of success was so exalted, and his fastidiousness so great, that he could never satisfy himself, and, as he did not succeed in satisfying anybody else, he determined on again changing his plans.

He now proceeded, in the autumn of 1803, to the metropolis to start as a literary adventurer. He commenced his almost endless series of publications with the essay on the 'Principles of Human Action,' and on which, we are told by his son, he always prided himself as much as on any other of his numerous works. As a metaphysical essay it is however of little value, though to a certain extent ingenious and acute; while, so far as the merits of composition are concerned, it is inferior to his writings on miscellaneous literary subjects. This essay was published anonymously in 1805, and was followed up quickly by other works. In 1808 he married a Miss Stoddart, the sister of Dr. (afterwards Sir John) Stoddart; and after his marriage retired into Wiltshire, where he continued without intermission his literary pursuits. In 1811 he returned to London, and we find his residence in a house in York-street, Westminster, which had been once inhabited by Milton, and which then belonged to Bentham. His admiration for genius led him to erect, in the garden of this house, a tablet, "inscribed to the Prince of Poets:" and he was afterwards much scandalised by a plan of Mr. Bentham's to cut down two beautiful cotton-trees which inarched this tablet, and to expose the garden and the tablet to the continual inroad of the members of a Chrestomathic school. The passage however in the 'Spirit of the Age,' in which Hazlitt speaks of this contemplated profanation, as he deems it, is perhaps not altogether free from an affected sentimentality.

In 1813 Hazlitt delivered a course of lectures at the Russell Institution, on the history of English philosophy; and subsequently he lectured on the English poets generally, the comic poets, and the poets of the age of Elizabeth, in separate courses, at the Surrey Institution. He acted for a short time also as reporter to the 'Morning Chronicle,' and after giving it up he still wrote occasionally in that paper, and also in the 'Examiner.' He was also, in the latter part of his life, a contributor to the 'Edinburgh Review,' and to some smaller magazines. His life was indeed one unintermitting course of literary exertion; and his labours brought him in a considerable income, which however his imprudence always quickly dissipated. In 1822 he was divorced from his wife, and two years afterwards he married a second time. He died on the 18th of September 1830 of cholera.

Hazlitt's principal works, besides those which have been already mentioned are the 'Round Table,' in which he was assisted by Mr. Leigh Hunt; the 'Table Talk'; the 'Plain Speaker,' which three are collections of essays in two volumes each; the 'Characters of Shakspere's Plays'; the 'Spirit of the Age,' which is a series of interesting sketches of his most distinguished contemporaries; his 'Political Essays,' which are collected from different newspapers and magazines, and published in one volume, with a preface, by Hone; and the 'Life of Napoleon,' which Hazlitt himself looked upon as his great work, and which was his last. The article Fine Arts, in the 'Encyclopædia Britannica,' and the 'Life of Titian,' to which the name of Northcote is appended, were also written by Hazlitt.

The principal merits of Hazlitt as a writer are force and ingenuity of illustration, strength, terseness, and vivacity. Another characteristic, which, by excess, often becomes a fault, is abundance of quotation. And while, as has been said, one good quality frequently exhibited in his writings is terseness, it often happens that he is chargeable with the opposite faults of verbiage and diffuseness. There is also a want of repose in his style, which prevents its pleasing for a long time, and which, despite the excellence of particular passages, tends to leave an unsatisfactory general impression. Hazlitt's chief title to fame is derived from his essays on subjects of taste and literature, which are deservedly popular. For an historian he was too prejudiced, to say nothing of the unfitting luxuriance of his style; and he was not clear-headed enough for a metaphysician.

Shortly after Hazlitt's death, two volumes of his 'Literary Remains' were published by his son, with a short life; and a uniform edition of his principal works has since been carefully edited by his son, William Hazlitt, who is also favourably known by various other literary labours, chiefly translations and compilations.

* HEAD, SIR EDMUND WALKER, 8th Baronet, son of the Rev. Sir John Head, 7th Baronet, was born in 1805 at Warton Place, near Maidstone, Kent. He was educated at Oriel College, Oxford, where, in 1827, he was first class in classics. He was elected a fellow of Merton College, and took his degree of M.A. in 1830. In 1834 he was university examiner. He married in 1836, and succeeded his father in 1838.

In December 1841 he was appointed one of the three Poor-Law Commissioners, having for some time previously been one of the assistant-commissioners. In October 1847 he was appointed Lieutenant-Governor of the British colony of New Brunswick, an office which he held till September 1854, when he was made Governor-General of Canada, with a salary of 7000*l*. His son, John Head, born in 1840, is his heir.

Sir Edmund Head wrote the article 'Painting' for the 'Penny Cyclo-pædia.' He afterwards wrote a 'Hand-Book of the History of the Spanish and French Schools of Painting, intended as a Sequel to Kugler's Hand-Books of the Italian, German, and Dutch Schools of Painting,' 12mo, London, 1848, a work which, from its portable size, as well as its careful research and abundant information, is of great service to the tourist who is desirous of studying the masterpieces of the painters of Spain and France. Sir Edmund observes, in the Preface to his work, that his reason for writing it was the brief and imperfect manner in which Kugler had treated the Spanish, French, and English schools. Sir Edmund Head also edited, and supplied with notes and a preface, the 'Hand-Book of Painting: the German, Flemish, Dutch, Spanish, and French Schools; partly translated from the German of Kugler by a Lady,' 2 vols. 8vo, London, 1854, illustrated edition.

* HEAD, SIR FRANCIS BOND, Baronet, brother of Sir George Head, was born in 1793, at the Hermitage, near Rochester, Kent, where his early years were passed. He entered the army, married the daughter of Lord Somerville in 1816, and was a captain in the corps of engineers, on duty at Edinburgh, in 1825, the year of mining speculations, when it was proposed to him to take charge of an association for working the gold and silver mines of the South American provinces of Rio de la Plata. He accepted the offer, sailed from Falmouth, and arrived at Buenos Ayres. Accompanied by a surveyor, an assayer, and seven miners from Cornwall, provided with suitable means of conveyance, he proceeded to the gold mines of San Luis, and thence to the silver mines of Upsallata, beyond Mendoza, about 1000 miles from Buenos Ayres. Leaving his party at Mendoza, at the foot of the Andes, he returned on horseback across the Pampas to Buenos Ayres by himself, performing the distance in eight days. Letters received at Buenos Ayres made it necessary that he should go immediately to Chili, and accordingly he again crossed the Pampas, and joining his party at Mendoza, they crossed the Andes to Santiago, and thence proceeded in different directions about 1200 miles to inspect gold and silver mines. Having concluded his report on the last mine, the party recrossed the Andes, and Captain Head rode across the Pampas to Buenos Ayres, leaving the rest to follow him. When they arrived, he dismissed some of the miners and returned with the rest to England. He rode in this rapid manner upwards of 6000 miles, living chiefly on dried beef and water, and sleeping out on the ground. After his return to London, he published 'Rough Notes taken during some rapid Journeys across the Pampas and among the Andes, by Captain F. B. Head,' 12mo, 1826. This lively and graphic narrative attracted universal attention, and was read with great interest.

In December 1828 Captain Head attained the rank of Major. In 1830 appeared 'The Life of Bruce, the African Traveller, by Major F. B. Head,' 18mo, London, which was followed by a series of humorous sketches under the title of 'Bubbles from the Brunnen of Nassau, by an Old Man,' 8vo, 1833. In November 1835, while performing the duties of assistant poor-law commissioner in the Kent district, he received a summons at midnight from Lord Glenelg, then colonial minister, requiring his immediate attendance in London. When he waited upon the minister, he was offered the situation of lieutenant-governor of Upper Canada, as successor to Sir John Colborne, who had been dismissed. With some reluctance he accepted the appointment, with the promise of a baronetcy. There was at that time much dissatisfaction in the Canadas, and differences of opinion soon occurred between the lieutenant-governor and the English ministry as to the measures which ought to be adopted. He was created a baronet in the spring of 1837; in the same year an insurrection, abetted and aided by the Americans, broke out in Upper Canada, which after a short struggle, was suppressed by the colonial militia. In September 1837 he sent in his resignation, which was accepted, and on the 23rd of March 1838, he was released from his duties by the swearing in of his successor, Sir George Arthur. After his return to England he published a 'Narrative,' 8vo, 1838, in justification of his measures. He returned to the political state of the Canadas and his own proceedings while there, in his 'Emigrant,' 12mo, 1846, of which he says, "as the common crow is made up of a small lump of carrion and two or three handfuls of feathers, so is this volume composed of political history, buoyed up by a few light sketches, solely written to make a dull subject fly." In 1850, after Louis Napoleon had become president of the French Republic, and there were vague rumours of an invasion, Sir Francis Head published 'The Defenceless State of Great Britain,' 8vo, a work which, together with much that was true, contained many erroneous statements, and a good deal of exaggeration. In the month of May 1851 he collected his 'Faggot of French Sticks,' 2 vols. 8vo, an exceedingly interesting description of places, scenes, and modes of living in Paris and its vicinity. In 1852 he published 'A Fortnight in Ireland,' 8vo, of which about two-thirds consist of an account of his residence in Dublin and his tour in the

west of Ireland, lively and graphic as usual; the other third is a description of the degraded state of the poor in Ireland, and an attack on the Irish Roman Catholic priesthood. He has a pension of 100*l*. a year for his services to literature. Sir Francis Head is one of the most amusing of tourists. His descriptions of scenes, objects, and characters, are distinct and striking; his style is full of vivacity, sparkling with illustrations and delicately tinted with humour. His heir is Frank Somerville Head, his son, who is on the Bengal establishment of the civil service of the East India Company.

HEAD, SIR GEORGE, Knight, was born in 1782 at the Hermitage, a few miles north from Rochester, in Kent. James Roper Head, father of Sir George Head and Sir Francis Bond Head, was descended from Fernando Mendez, a Jew, who came from Portugal to England, and was physician to King Charles II. The father of James Roper Head, married a daughter of the Rev. Sir Francis Head, Bart., and assumed the name of his wife's father.

George Head spent his early years at his father's residence, the Hermitage, and was afterwards educated at the Charter House School, London. Early in 1808 he obtained a captain's commission in the West Kent Militia, and having obtained leave of absence, in the spring of 1809 went to Portugal, where he accepted the humble situation of a commissariat clerk, and joined the British army under Lord Wellington at Badajoz. He was afterwards appointed to the commissariat charge of a brigade. After Massena had retreated from the lines of Torres Vedras, and the battle of Fuentes d'Onor had been fought, May 5, 1811, he was appointed deputy commissary general, and attached to Sir Brent Spencer's division of the army. In May 1813 he was directed to proceed to Momento da Beira to undertake the commissariat department of the third division under Sir Thomas Picton. He was present at most of the great battles in the Peninsula, as well as the concluding victories in France, after which he returned to England. Of this active period of his life he wrote an interesting narrative, which is attached to his second 'Home Tour.'

In the autumn of 1814 George Head received orders to proceed to Canada, and having landed at Quebec, was sent to Lake Huron to superintend the commissariat department of a naval establishment intended to be formed on the Canadian lakes. Peace however was soon afterwards made with America, and in ten months he was again in England. In 1816 he was sent to Halifax in Nova Scotia, and remained there five years on the peace establishment. After his return to England he described his experiences and adventures in America in his 'Forest Scenes and Incidents in the Wilds of North America, being a Diary of a Winter's Route from Halifax to the Canadas, and during Four Months' Residence in the Woods on the Borders of Lakes Huron and Simcoe, by George Head, Esq.,' 12mo, London, 1829. In 1831 he received the honour of knighthood. Encouraged by the favourable reception of his 'Forest Scenes,' he published 'A Home Tour through the Manufacturing Districts of England in the Summer of 1835, by Sir George Head,' 12mo, 1836, which was followed by another volume, 'A Home Tour through various Parts of the United Kingdom; being a Continuation of the Home Tour through the Manufacturing Districts: also Memoirs of an Assistant-Commissary General, by Sir George Head,' 12mo, 1837. The first Tour includes most of the larger manufacturing towns of the northern part of England; the second, the Isle of Man, part of Scotland, the Channel Islands, and part of Ireland. They contain a large amount of information carefully collected and clearly stated concerning the places visited and the manufactures carried on in them. Both Tours were reprinted in one volume in 1840. In 1849 he published 'Rome, a Tour of Many Days.' He was also the author of several articles in the 'Quarterly Review,' and translated from the Italian the 'Historical Memoirs of Cardinal Pacca,' 12mo, 1850, and from the Latin, 'The Metamorphoses of Apuleius,' 8vo, 1851. He died in London, May 2, 1855, unmarried.

HEARNE, THOMAS, an eminent English antiquary and editor of books and manuscripts, was born at White Waltham, in Berkshire, in 1678, where his father was the parish clerk. In 1692, under the patronage of Francis Cherry, Esq., of that place, with whom he had lived as a servant, he was placed at the Free-school of Bray; and subsequently, in 1695, at that gentleman's expense, was entered of Edmund Hall, Oxford, where Dr. White Kennet, afterwards bishop of Peterborough, was his tutor. Dr. John Mill, who was principal of the hall, and Dr. Grabe, gave Hearne much employ in his younger days in the collation of manuscripts. He became B.A. in 1699. In 1701 he received his first employment in the Bodleian Library, of which Dr. Hudson had just been chosen keeper. He was afterwards made janitor of the library, and in 1712 succeeded to the place of second librarian. In January 1715 he was elected architypographer and esquire beadle of civil law in the university, which post he held with his under-librarianship till the month of November following, when, finding the two places untenable together, he resigned the beadle's place, and soon afterwards his post in the Bodleian Library, on account of the oaths to the government, with which he could not conscientiously comply. He continued a non-juror to the last, much at the expense of his worldly interest. In the latter part of his life he resided principally at Edmund Hall, preparing and publishing his various works; but his constant recurrence to Jacobite sentiments,

even in the prefaces to publications which could have no connection with them, kept him as constantly at variance with his neighbours in the university; and he underwent more than one prosecution. Hearne's temper was naturally irritable, and he was far from being either an amiable or a happy man. His life however was one of unwearied literary industry, and English antiquaries and historians will be for ever indebted to him. He died on the 10th of June 1735, in consequence of a cold, succeeded by a fever which was improperly treated.

Hearne's publications, almost exclusively printed by subscription at Oxford, were very numerous. Among the most valuable were, an edition of *Livy*, 6 vols. 8vo, 1708; the 'Life of Alfred the Great,' from Sir John Spelman's manuscript in the Bodleian Library, 8vo, 1710; Leland's 'Itinerary,' 9 vols. 8vo, 1710; Leland's 'Collectanea,' 6 vols. 8vo, 1715; the 'Acts of the Apostles,' in Greek uncials, from a very ancient manuscript in Archbishop Laud's collection, 8vo, 1715; Livius Foro-Julienais's 'Life of Henry V.,' 8vo, 1716; Alured of Beverley's 'Annals,' 8vo, 1716; Roper's 'Life of Sir Thomas More,' 8vo, 1716; Camden's 'Annals,' in Latin, 3 vols. 8vo, 1717; 'William of Neubridge,' 8vo, 1719; the 'Textus Roffensis,' 8vo, 1720; Fordun's 'Scotichronicon,' 8vo, 1722; 'History and Antiquities of Glastonbury,' 8vo, 1722; Heming's 'Chartulary,' 8vo, 1723; 'Robert of Gloucester's Chronicle,' 2 vols. 8vo, 1724; 'Peter Langtoft's Chronicle,' 2 vols. 8vo, 1725; 'Adam of Domerham,' 2 vols. 8vo, 1827; the 'Liber Niger Scaccarii,' 2 vols. 8vo, 1728; 'Hemingford's History,' 2 vols. 8vo, 1731; Otterbourne and Whethamstede's 'Chronicles,' 2 vols. 8vo, 1733; the 'Annals of Dunstable,' 8vo, 1733; and 'Benedict, Abbot of Petersborough,' 2 vols. 8vo, 1735.

Hearne left his manuscript collections by will to Dr. William Bedford, of whom they were purchased by Dr. Richard Rawlinson for 100 guineas, and by him bequeathed, together with his own manuscripts, to the Bodleian Library. Hearne's manuscript Diary, in 150 small paper books, is amongst them.

Several of Hearne's pieces were reprinted at different times, and in 1810 the project was entertained of reprinting the whole series in a uniform manner; but after the publication of four volumes, containing 'Robert of Gloucester' and 'Peter Langtoft's Chronicle,' the scheme was abandoned.

(*Lives of Leland, Hearne, and Wood*, 8vo, Oxford, 1772; Nichols, *Literary Anecdotes of the Eighteenth Century*; Chalmers, *Biog. Dict.*, &c.)

HEBER, REGINALD, second Bishop of Calcutta, was born on the 21st of April 1783, at Malpas, Cheshire, of which place his father was for many years co-rector. The family was of considerable antiquity in the county of Yorkshire, and on the death of an elder brother without heirs-male, the father of Reginald Heber succeeded him as lord of the manor of Marton, Yorkshire, and patron of the rectories there, and to estates at Hodnet, Shropshire, which had come into the possession of the family by intermarriage. By his first marriage, with Mary, co-heiress of the Rev. Martin Baylie, rector of Wrentham, Suffolk, he had one child, Richard, who for some time was representative in parliament of the University of Oxford, and is known as a great collector of books; and by his second marriage, with Mary, daughter of Cuthbert Allanson, D.D., he had three children—Reginald, the subject of the present notice, Thomas Cuthbert, and Mary.

At a very early period of his childhood Reginald Heber was remarkable for his piety and for his eager thirst for knowledge. An excellent memory enabled him to recollect through life whatever he read with almost verbal accuracy. He gave early indications of his poetical talents, and at seven years old he had translated Phædrus into English verse. At eight he was sent to the grammar-school of Hawkhurst under Dr. Kent, and in his thirteenth year he was placed in the school of a clergyman near London. He remained here about three years, and in November 1800 was entered at Brasenose College, Oxford. In his first year at the university he gained the prize for Latin verse, the subject of his poem being on the commencement of the new century. In the spring of 1803 he wrote his prize poem, 'Palestine,' which has obtained a permanent place in English literature. His career at Oxford was one continued course of success. From the modesty of his manners, his gentleness of disposition, and the charm of his conversation, his society was courted by persons of all ages. In his studies he evinced no taste for the exact sciences, but the ancient languages he studied with larger views than was then usual with young men at the universities. In 1804 he became a Fellow of All Souls. The year after he had taken his degree he gained the Bachelor's prize for an English prose essay on the 'Sense of Honour.' About the middle of 1805, in company with his friend Mr. John Thornton, son of the member for Surrey, he set out on a continental tour. They proceeded through Russia, the Crimea, Hungary, Austria, and Prussia, and returned to England in October 1806.

In 1807, before he had obtained his degree of M.A., he took orders, and was instituted by his brother Richard to the family living at Hodnet. Here, as he himself described, he was in a "half-way situation between a parson and a squire." Never however were the duties of a parochial clergyman discharged with more exemplary zeal and benevolence; and Heber's conduct in his parish has often been

pointed at as displaying in the greatest perfection all the best characteristics of a Church of England priest. In April 1809 he married Amelia, youngest daughter of Dr. Shipley, dean of St. Asaph. While discharging the duties of his parish with so much earnestness, he was ardently attached to the pursuits of literature. He was a frequent contributor to the 'Quarterly Review' from its commencement. In 1812 he commenced the preparation of a 'Dictionary of the Bible,' on which he laboured with much delight; but other duties compelled him to suspend this work, and no part of it was ever published. In the same year he published a small volume of 'Poems and Translations for Weekly Church Service.' The composition of his 'Hymns,' with a view of improving the psalmody and devotional poetry used in churches, was also a favourite recreation. He was an elegant versifier, and continued to indulge his poetical talents even while engaged in visiting his diocese in India. He had a great distaste for controversial theology, and only once was engaged in a discussion of this kind, in reply to what he conceived were the unwarrantable imputations of a writer in the 'British Critic.' His life was diversified by an occasional visit to his friends in other parts of England, or to his father-in-law in Wales, and by correspondence with a few friends. His political views were those of the High Church and Tory party, but quite devoid of bitterness. In 1815 he was appointed Bampton lecturer, and the subject he selected was 'The Personality and Office of the Christian Comforter.' In 1817, Dr. Luxmore, the bishop of St. Asaph, appointed Heber to a stall in that cathedral, at the request of his father-in-law, the dean. In 1819 he edited the works of Bishop Jeremy Taylor. His other works consist of 'Parish Sermons,' preached at Hodnet; and Sermons preached in India. In April 1822 he was elected preacher of Lincoln's Inn, for which he had formerly been an unsuccessful candidate.

On the 2nd of December, in the same year, his friend and connection, the Right Honourable Charles W. Williams Wynn, who was at the time president of the Board of Control, consulted him confidentially respecting the appointment to the vacant see of Calcutta, but did not offer him the appointment. There was every probability in fact that in the course of a few years Heber would obtain a mitre at home. But in another communication the vacant see was offered to him, and, without pressing him to accept it, Mr. Wynn expressed the opinion that in no position would Heber's talents find so ample a field or be so beneficial as in India. Twice the offer was declined, on account of his wife and child; but immediately after the second refusal he wrote (January 12th, 1823) stating his willingness to go to India. He congratulated himself upon the fact that no worldly motives led him to this decision. The prospects of usefulness in so grand a field as India overbore all pecuniary considerations, and they had no influence in determining his conduct when the proposition of going to that country was first made to him. Besides, he had often expressed his liking for such a sphere of action, and he had "a lurking fondness for all which belongs to India or Asia." On the 22nd of April he saw Hodnet for the last time, and, after having been consecrated, he embarked for his diocese on the 16th of June 1823.

The diocese of Calcutta extended at this time over the whole of India, and embraced Ceylon, the Mauritius, and Australasia. In India the field of the bishop's labours was three times larger than Great Britain and Ireland. The number of chaplains who constituted his staff at Bengal was fixed at twenty-eight, but this number was never completed, and of the number who were appointed several were on furlough. The bishop had no council to assist him, was required to act on his own responsibility, and to write almost every official document with his own hand. On the 15th of June 1824, Bishop Heber began the visitation of his vast diocese. He visited nearly every station of importance in the upper provinces of Bengal and north of Bombay, and after an absence from Calcutta of about eleven months, during which he had seldom slept out of his cabin or tent, he arrived at Bombay. The Journal which he kept during his visitation, and which has been published in three octavo volumes (and since reprinted so as to form two volumes of Murray's 'Home and Colonial Library'), shows the extent of his observations on general subjects and the graphic power which he possessed of describing the novel scenes in which he was placed. From April to August he remained at Bombay to investigate and superintend the interests of the western portion of his diocese. On the 15th of August he sailed for Ceylon, and after remaining there some time he proceeded to Calcutta, which he reached on the 21st of October. If it had been possible to have educated his children in India, he was now prepared, he states, to end his days amongst the objects of his solicitude. In February 1826 he left Calcutta for Madras to visit the southern provinces. On the 1st of April he arrived at Trichinopoly, and on the 3rd, after investigating the state of the mission and confirming fifteen natives, on whom he bestowed the episcopal benediction in the Tamul language, he retired to use a cold bath, in which he was found dead about half-an-hour afterwards. Within less than three weeks he would have completed his forty-third year.

The candour, modesty, and simplicity of Bishop Heber's manners, his unwearied earnestness and his mild and steady zeal, combined with his talents and attainments, had inspired veneration and respect not only amongst the European but the native population of India. It was said by those who were capable of judging, that few persons, civil

or military, had undergone so much labour, traversed as much country, seen and regulated so much in so short a time. On the announcement of his death the most eminent men at each of the three Presidencies and in Ceylon united in showing their regret at the loss which they had sustained. At Calcutta it was agreed to erect in the cathedral a monument to his memory, which was afterwards executed by Chantry. A monument, also by Chantry, was erected in St. George's Church, Madras, in testimony of the public regret. At Bombay it was resolved to establish, in Bishop's College, Calcutta, one or more scholarships under the title of 'Bishop Heber's Bombay Scholarship.' Mural tablets were erected in the churches of Trichinopoly and at Colombo in Ceylon. His friends in England placed a monument in St. Paul's Cathedral; and in Hodnet church there is a tablet to his memory, the inscription on which was written by Southey.

(*Life of Reginald Heber*, by his Widow, 2 vols. 4to, London, 1830. This work contains Selections from his Correspondence, Unpublished Poems, and Private Papers; the Journal of his Tour in Russia, &c., and a History of the Cossaks. *Last Days of Bishop Heber*, by the Archbishop of Madras.)

HEBERDEN, WILLIAM, M.D., was born in London in 1710. In 1724 he was sent to St. John's College, Cambridge, of which, six years afterwards, he was elected a fellow. He studied medicine in Cambridge and London, and after taking his degree practised as a physician, and delivered an annual course of lectures on materia medica in that university. In 1746 he was elected a Fellow of the Royal College of Physicians, and soon after left Cambridge, and commenced practising in London, where he at once met with the greatest success, and obtained the highest reputation. After thirty years' extensive practice, finding his health declining, he gradually withdrew himself from his profession to retirement in Windsor, where he died in 1801. In 1750 he was elected a Fellow of the Royal Society, and in 1778 an associate of the Royal Society of Medicine in Paris.

It was at the suggestion of Dr. Heberden that the publication of the *Medical Transactions* of the College of Physicians was commenced. He contributed many valuable papers to the first volume, which appeared in 1768, and to two succeeding volumes: among them may especially be noticed his paper on the Angina Pectoris, a disease not previously described, and that on the Chicken-pox, which he first distinguished from the Small-pox. He contributed also some papers to the 'Transactions of the Royal Society;' but his principal work was the 'Medical Commentaries,' which he wrote in 1782, and which was published after his death. It is written in very elegant Latin, and contains the practical results of his lengthened experience. Compiled from observations which he had always been in the habit of writing by the bedside of his patient, it affords sufficient evidence of an accomplished and observing mind, and of very extensive practical knowledge. (Memoir prefixed to the 'Commentaries'.)

HECATÆUS of Miletus, son of Hegeander, and one of the earliest Greek prose writers, was born probably about B.C. 550. He was present at the deliberation of the Ionians (B.C. 501), and attempted to dissuade them from revolting against the Persian king. (Herod., v. 36.) He is also mentioned by Herodotus (v. 125) as being alive at the time of the flight of Aristagoras, B.C. 497. His works, which consisted of histories, genealogies, and geographical pieces, were held in considerable esteem by the ancients. Herodotus (vi. 137) quotes one of his historical works. Strabo (i. p. 12, Casaubon) complains that his geographical works only contained the descriptions of the poets written in prose; but he is mentioned by Ammianus Marcellinus (xiii. 8.) in conjunction with Eratosthenes and Ptolemy. Hecateus appears, like Herodotus, to have visited distant countries for the purpose of acquiring information respecting the history, customs, and physical peculiarities of foreign lands. Herodotus (ii. 143) gives an account of a conversation of Hecateus with the priests at Thebes in Egypt, which was apparently derived from his works.

The fragments which remain of the writings of Hecateus have been published by Creuzer in his 'Historicorum Græcorum Antiquissimorum Fragmenta,' 8vo, Heidel., 1806; by Klausen, 'Hecatei Milesii Fragmenta,' 8vo, Berl., 1831; C. and J. Muller, 'Fragm. Hist. Græc.,' Paris, 1841; and in the 'Museum Criticum,' vol. i. p. 88-101, Camb., 1814.

HECTOR (*Ἕκτωρ*), the greatest of the Trojan heroes who figure in our accounts of the Trojan war. He was the son of Priam and Hecuba, and married to Andromache. The poet of the 'Iliad' describes him not only as a bold and gallant warrior whom Achilles himself dreaded to approach, but as a hero ennobled by all the more tender and humane virtues, so that it almost seems as if the poet had developed his character with more care than that of any other hero, not even excepting Achilles. Hector is the favourite of his parents, and himself a happy husband and father. The reader need only be reminded of the beautiful passages in the 'Iliad' (vi. 369, &c.), where Hector, before going to battle, takes leave of his wife and child, and where (xxiii.), amid the lamentations of his parents, he prepares himself for the contest with Achilles. Wherever the battle is fiercest, Hector is foremost, and, protected by the gods Ares (Mars) and Apollo, he fights victoriously against the bravest of the Greeks, such as Ajax, Nestor, Diomedes, and Teucer. He was foremost among those who stormed the Greek camp, and advanced as far as the place where their

ships were stationed. Patroclus then came forward and drove the Trojans back to their city, but was slain by Hector. This calamity roused Achilles from his inactivity, and, thirsting to avenge the death of his friend, he sought Hector, who, though implored by his parents to save himself, resolved to engage with his enemy. Achilles thrice chased him round the walls of Troy, and finally pierced him with his spear. Hector's body was tied to the conqueror's chariot and dragged to the camp of the Greeks; at the funeral solemnities of Patroclus, it was dragged thrice around his tomb, and then thrown away to be devoured by the dogs; but at length Achilles gave up the body to Priam, who appeared as a suppliant before him and begged for it. The remains of Hector were buried at Troy, where funeral sacrifices were offered to Hector as a hero; at a later time however his remains are said to have been conveyed to Thebes, in pursuance of an oracle. (Pausanias, iii. 18. 9; ix. 18. 4.)

HEEM, JAN DAVITZE DE, one of the most distinguished of the Dutch fruit and flower painters, was born at Utrecht about 1600, and died at Antwerp in 1674.

His son Kornelis, or Cornelius, was likewise an excellent painter in the same department.

HEEMSKERK, MARTEN, a celebrated Dutch painter, who was born at Heemskerk, near Haarlem, in 1498: he was the son of a peasant farmer, Jacob Willemsz van Veen, but he is known only by the name of his birthplace. Marten was employed by his father in common farm labour, which was particularly distasteful to him. He had given evidence of a talent for the art of design, and his mother was favourable to his plan of becoming a painter. As he was returning home one evening with a pail full of milk upon his head, lost in a reverie about his future prospects, he came unconsciously in contact with a tree; the milk was lost, and to Marten's dismay he saw his father hastening up to him with a stick in his hand. His mind was instantly made up; he fled to Delft, obtained admission into the house of a painter of the name of Jan Lucas, and became himself a painter. He studied afterwards with Jan Schoorel, at Haarlem, and his earliest works of distinction were painted in the style of that master. After painting for some years at Haarlem with great success, he set out, in 1532, for Rome, but before he left he presented the Painters' Company at Haarlem with a picture of 'St. Luke painting the Virgin Mary,' a picture which is much praised by Van Mander, and was long preserved with great care at Haarlem. In Rome, Marten, known as Martin Tedesco, distinguished himself as an imitator of Michel Angelo; the jealousy of the Italians however it is said forced him to return to his own country, after a stay of three years in Italy.

Heemskerk's early admirers were not at all pleased with the new style which he imported from Italy; he however found many new admirers, and he executed numerous works in this new style. In his earlier paintings he belonged to the school of the Van Eycks: his style was simple, earnest, and in character natural; in his later paintings he imitated in a manner the antique and the cinquecento style of Italy, but he caricatured the antique, and caught only the defects of the modern. There are scarcely any works by Heemskerk now at Haarlem; some were carried to Spain during the Spanish war, and many were destroyed by the iconoclasts in the riots of 1566. A 'Last Judgment' by him is at Hampton Court; and there are several of his earlier works in the Pinakothek, at Munich, which however show that he was not one of the best of the Van Eyck school. He died very rich, and, though twice married, childless, at Haarlem, in 1574. The engravings after his works, by various masters, amount to many hundreds.

(Van Mander, *Het Leven der Schilders*, &c.; Schopenhauer, *Johann Van Eyck und seine Nachfolger*.)

HEERE, LUCAS DE, a distinguished painter and poet, was born at Ghent in 1534. His father, Jan de Heere, was a good sculptor, and his mother excelled in miniature painting. Lucas was placed with Frans Floris, after he had made sufficient progress with his father to benefit by the instruction of Floris.

De Heere painted in France; and he was in England in the reign of Queen Elizabeth, whom he painted several times. There is a flattering allegory of her by him at Hampton Court: it represents Elizabeth as queen, attended by two maids of honour, coming into the presence of Juno, Minerva, and Venus; the first is put to flight, the second is astonished, and the last blushes; as is pretty broadly indicated by some Latin verses, probably by De Heere himself, written on the frame. In 1570 Lucas was employed to paint a gallery for Edward, earl of Lincoln, lord high admiral, in which he was to represent the costumes of different nations. For England, says Van Mander, he painted a naked man surrounded by all sorts of woollen and silk stuffs, with a pair of scissors and a piece of chalk; and when the admiral asked him to explain it, Lucas said that he could not paint the Englishman in any particular costume, as he changed it daily; he therefore painted him naked, gave him stuff and shears, and left him to make his own clothes. This however, as Walpole has pointed out, was not an original device; it is prefixed by Andrew Borde, or Andrea Perforatus as he calls himself, to his 'Introduction to Knowledge.'

The principal of Lucas's poetical works was the Garden of Poetry, 'Boomgaard der Poesijë;' he commenced also in verse the 'Lives of the Painters,' but this is lost. He died at Ghent in 1584: he used for

a monogram an H and E joined, and he used also sometimes the following moral anagram of his own name, 'Schade leer u' (injuries teach you). De Heere was the master of Van Mander.

(Van Mander, *Het Leven der Schilders, &c.*; Walpole, *Anecdotes of Painting, &c.*)

HEEREN, ARNOLD HERMANN LUDWIG, was born at Arbergen, a village near Bremen, on the 25th of October 1760. His father, who was pastor at Arbergen, and a man of extensive knowledge, gave him his first instruction in religion, Latin, and mathematics. His further education, until his sixteenth year, was intrusted to private tutors; but in 1776 his father was appointed preacher at the cathedral of Bremen, and young Heeren entered the domschule or gymnasium of Bremen to prepare himself for the university. He states that the exercises in Latin disputations at school, and the intercourse with the wealthy merchants of Bremen, exercised a great influence upon the development of his mind and upon the manner in which he afterwards viewed and described the phenomena of history and of human life. In the autumn of 1779 he went to the university of Göttingen with the intention of devoting himself to the study of theology, but the influence of Heyne, one of whose lectures he attended, wrought a complete change, and Heeren was soon engaged exclusively in philological pursuits. However he soon felt that philology, in the narrower sense of the term, was not his vocation, for the things about which he read in the ancients interested him more than the languages themselves. Heyne did all he could to win Heeren for philology, and for a short time he succeeded. In 1784 Heeren took his degree of doctor in philosophy, and on that occasion wrote a dissertation 'De Chori Græcorum tragici natura et indole, ratione argumenti habita.' In the year following he published a new edition of the rhetorician Menander, and formed the plan of a new edition of the 'Eclogæ' of Stobæus. The preparations that he had to make for this work convinced him that verbal criticism was not congenial to his mind. He had commenced giving lectures at Göttingen as privatdocent, but the opposition between his actual pursuits and what he felt to be his vocation became more and more painfully felt. He resolved to visit Italy, and principally Rome. One of the main objects of this journey was to collate the various manuscripts of Stobæus, but this did not prevent his paying attention to a variety of other subjects, which had more interest for him. His stay in many of the principal towns of Germany, France, and Italy was of great advantage to him; the future historian became acquainted with the world at large; he saw with his own eyes some of the countries to whose history a great part of his future life was to be devoted, and formed friendships with men of the highest eminence, such as Zoëga, Filangieri, and Cardinal Borgia, in the intercourse with whom his mind became expanded and enriched with new ideas.

On his return to Göttingen in 1787, he was appointed professor extraordinary in the philosophical faculty, and henceforth his life flowed undisturbed by any changes of fortune; being possessed of wealth, he was enabled to continue his philological and historical studies without anxious cares; he enjoyed the favour and friendship of the highest in rank and literature, and in 1796 he married a daughter of Heyne, who remained his devoted and sympathising companion throughout his life. All his energies were divided between his professional studies and duties, and the production of those works which have secured him a place among the best historians. His lectures had from the first an historical tendency, and if it had not been for the edition of Stobæus, which he had undertaken, he would have confined himself exclusively to lecture on history. At length in 1799 he was appointed ordinary professor of history, as the successor of Gatterer. His reputation as a scholar and historian was already established, for the first two volumes of his Stobæus had appeared in 1792 and 1794 (the third and last was published in 1801); in 1793 and 1796 he had published the first two volumes of his 'Ideen über die Politik, den Verkehr und den Handel der vornehmsten Völker der alten Welt' (the third and fourth volumes appeared in 1812 and 1815), which is his principal work, and the one on the completion of which he looked as the main object of his life; a fifth edition in 5 vols. appeared in 1824, &c. In 1799 he published the first edition of his manual of ancient history ('Handbuch der Geschichte der Staaten des Alterthums'). A fifth appeared in 1826. It must be remembered that in addition to these works, which followed one another in rapid succession, and of which each has its own merits, he had for some years been editing, conjointly with his friend Tychsen, a journal on ancient literature and art ('Bibliothek der alten Literatur und Kunst'), and had written a great variety of essays for other periodicals, and for the 'Transactions of the Royal Society of Göttingen.' In addition to all this, he began about the year 1800 to study the history of the middle ages and of modern times, and also lectured upon these subjects with as much applause as he had before obtained by his lectures on ancient history. It is further worth mentioning that Heeren's activity as an author was always in the closest connection with that of a lecturer, and before he wrote a work on any subject he had at least once or twice lectured on it in the university. Hence he always appears a master of his subject, and was enabled to give to his productions that finish and perfection which make them popular in the best sense of the term, and which is certainly a rare characteristic of German writers. An important work relating to the

history of modern times, and which is thought by some to be the best of his productions, bears the title 'Handbuch der Geschichte des Europäischen Staatensystems und seiner Kolonien,' Göttingen, 1809; a fourth edition appeared in 1822. A work on the influence of the Crusades ('Sur l'influence des Croisades,' Paris, 1808) was crowned by the Academy of Inscriptions. A collection of his minor historical works, in 3 vols. ('Kleine historische Schriften'), appeared from 1803 to 1808, and another embracing all his historical works, in 15 vols., from 1821 to 1826. Most of his works have been translated into English and Dutch; and some of them are still regarded as standard works of their kind. On the death of Eichhorn, in 1827, he undertook the editorship of the 'Göttingische Gelehrten Anzeigen,' which, together with his professional duties, took up so much of his time that he was unable to complete his great work on the politics and commerce of the states of antiquity, although considerable preparations had already been made for it.

Heeren's merits were universally acknowledged. The academies of St. Petersburg, Berlin, Munich, Stockholm, Dublin, and Copenhagen showed him their respect by electing him a member. He was also a member of the Asiatic societies of London and Calcutta. In 1827 or 1828 Heeren, in conjunction with Ukert, formed the plan of editing a series of works, containing the histories of the states of Europe. The best historians of Germany were induced to write histories for the series, which however was left incomplete at Heeren's death. Among the works included in this series are some of the highest eminence, such as Lappenberg's 'History of England,' and Geijer's 'History of Sweden.' Heeren died at Göttingen, on the 6th of March 1842.

The great merits of Heeren's works, especially of those relating to antiquity, are these: they are usually the result of a diligent study of the ancient writers themselves, and represent the nations in their political and commercial relations in a very lively manner. His works are written in a clear style, so as to be intelligible to any person of moderate education, and the influence which they have exercised is, for this very reason, very considerable. His works are not indeed without their defects, and many of them no longer satisfy the demands of our age; but it must not be forgotten that Heeren was the first historian, at least in Germany, who breathed life into the history of antiquity, saw in it something more than a mere succession of battles and defeats, and made his readers familiar with the more peaceful pursuits of the ancients and their principles of government. In his private life he is said to have been a man of the most gentle and benevolent disposition.

HEGEL, GEORGE WILLIAM FREDERICK, was born at Stuttgart on the 27th of August 1770, and was educated at the gymnasium of his native city. At the age of eighteen he proceeded to Tübingen to join the classes of theology and philosophy, where he had for his class-fellow the illustrious Schelling. Dissatisfied with the prevailing system of metaphysics, Hegel sought to supply its deficiencies by the works of Plato, Spinoza, and Kant; and in the conviction that a truly philosophical comprehension can only be educed by an enlarged and diversified inquiry, he combined with a knowledge of philosophy a profound acquaintance with the natural and political sciences. Upon being admitted to the degree of doctor in philosophy, he accepted an engagement as private tutor, in which capacity he lived for some years first in Switzerland, and afterwards at Frankfurt-on-the-Main, until, on the death of his father in 1800, he was enabled by the inheritance of a small patrimony to devote himself without restraint to the study of philosophy. He accordingly proceeded to Jena, where Schelling was teaching his system of 'Absolute Identity,' and of which Hegel was at this period one of the warmest partisans. Here he composed as an academical exercise the essay 'De Orbitis Planetarum' (Jena, 1801), and shortly afterwards his first philosophical work, entitled 'On the Difference of the Systems of Fichte and Schelling,' which treatise, notwithstanding the sincerity with which Hegel then advocated the views of the latter, contained the germ of that dissent which was afterwards expanded into a peculiar theory. He was also associated with Schelling in conducting the 'Critical Journal of Science,' and among the most important of the articles contributed by him is that 'On Faith and Science,' which contains a luminous review of the doctrines of Kant, Jacobi, and Fichte, whose several systems are represented as nothing more than so many forms of a purely subjective philosophy.

In 1806, when Schelling went to Würzburg, Hegel was appointed to supply his place as lecturer. The duty of communicating his views to others necessarily imparted to them distinctness and precision; and now for the first time Hegel openly avowed his dissatisfaction with the system of Schelling. The difference between the ideas of the master and disciple was marked still more strongly in the 'Phenomenology of Mind,' which was published at Bamberg, whither Hegel had retired after the battle of Jena. This work he used to call his 'Voyage of Discovery,' as indicating the researches he had passed through in order to arrive at a clear knowledge of the truth. It contains an account of the several grades of development through which the 'self,' or 'ego,' proceeds: first of all from consciousness into self-consciousness; next into reflecting and active reason, from which it becomes philosophical reason, self-cognisant and self-analysing, until at last, rising to the notion of God, it manifests itself in a religious form. The title 'Phenomenology' points out the limits

of the work, which is confined to the phenomena of mind as displayed in the elements of its immediate existence, that is, in experience. It traces the course of mind up to the point where it recognises the identity of thought and substance, of reason and reality, and where the opposition of science and reality ceases. Henceforward mind develops itself as pure thought or simple science, and the several forms it successively assumes, which differ only in their subject-matter or contents, are the objects of logic, or 'dialectic.'

During his retirement at Bamberg, Hegel conducted the political journal of that town with great ability, and with an honesty and candour rare in the journals of that period, until he was called in 1808 to preside over the gymnasium of Nürnberg. The duties of this situation he discharged with as much energy as skill, and he effected several valuable reforms both in the discipline and the studies of the school. In 1812 he published his 'Logic,' which was designed, with the 'Phenomenology,' to complete the whole body of science. Hegel employs the term logic in a very extended sense. He does not confine it, as is usually the case, to the account of the abstract forms of thought and the laws of the enchainment and development of ideas, but understands thereby the science of the self-sufficient and self-determining idea—the science of truth and of reality. From his fundamental principle, that thought and substance are one and identical, it followed that whatever is true of the former is true also of the latter, and consequently the laws of logic become ontological. From this point of view Hegel describes in this work the progress of reason; how, by virtue of a peculiar and inherent impulse, it passes constantly onwards, until at last it returns into itself. The general merits of this work were at once admitted, and the high powers of philosophical reflection which it evinced were acknowledged by the offer of a professorship at Heidelberg. His first course of lectures was attended by a numerous and distinguished class, attracted by the profoundness and originality of his views, notwithstanding the great obscurity of his style. By the publication of the 'Encyclopædia of Philosophical Sciences,' in 1817, his reputation as a philosopher was established, and Hegel was invited by the Prussian government to fill the chair at Berlin, which had remained vacant since the death of Fichte in 1814. This work, being designed as a manual for his class, takes a general view of his whole system, and exhibits in the clearest manner the ultimate tendency of his views. Considering logic as the base of all ontology, and starting from the idea in itself or potentially, he considers it as the essence and primary substance. He then examines thought as at first existing in itself, then in *other* or in nature; next in the mind of the individual, in a purely subjective point of view; and then objectively, in its outward realisation; and lastly, as he terms it, absolutely, that is, as manifesting itself in art, religion, and philosophy. From 1817 until death terminated his career there is nothing to relate in the life of Hegel beyond the constantly-increasing celebrity of his lectures and the publication of several works. He successively published the 'Philosophy of Jurisprudence,' two new editions of the 'Encyclopædia,' the first volume of the second edition of his 'Logic,' and several articles in the 'Annals of Scientific Criticism,' which he had established as an organ of his system, and of its application to every branch of art and science. He fell a victim on the 14th of November to the cholera which ravaged Berlin in 1831, and was, in compliance with his express desire, buried by the side of Fichte.

The history of philosophy from its earliest origin to its latest development forms so perfect and compact a whole, that no single part can be separately considered without losing something of its value and significance. This difficulty is greatly increased in the case of a philosophy which gives itself out not only as the completion of its immediate forerunner, but as the sum and result of all anterior systems. Accordingly our general view of the Hegelian system will be unintelligible unless preceded by a rapid sketch of the states of philosophy out of which it grew. The transcendental idealism of Kant formed the transition from the *empiricism* of the 18th century, and effected, as it were, a compromise between the ancient realism and the scepticism of Hume. To the system of Kant succeeded the pure and absolute idealism of Fichte, destined to be displaced in its turn by Schelling's system of absolute identity and intellectual intuition, which was itself to be further modified and developed by the *dialectical momentum* of Hegel. Essentially the systems of Hegel and Schelling are both founded on the same principle, namely, the absolute ideality of thought and being; for there is evidently but little difference between the doctrine of Schelling, which supposed that the human mind contains within it the fullness of reality and truth, the consciousness of which it may attain to simply by contemplating its own nature, and that of Hegel, according to whom the *concrete notion*, or the reason, comprises within itself all verity, and that in order to arrive at the science thereof it is only necessary to employ logical thought, or dialectic. The difference is purely a difference of method. For the cold and narrow abstractions, the rigorous formalism, of Fichte, Schelling had substituted a sort of poetical enthusiasm, and banishing from philosophy the scientific form it had received from Wolff, had introduced into it the rapturous mysticism of the intellectual intuition. Hegel however, insisting that the scientific system is the only form under which truth can exist, re-established the rights and utility of method by his doctrine of the *dialectical momentum*, or development of the idea. Indeed with Hegel the method of philosophy is philosophy

itself. This he defines to be the knowledge of the *evolution of the concrete*. The concrete is the idea, which, as a unity, is diversely determined, and has in itself the principle of its activity. The origin of the activity, the action itself, and the result, are one, and constitute the concrete. Its movement is the development by which that which exists merely potentially is realised. The concrete in itself, or virtually, must become actual; it is simple, yet different. This inherent contradiction of the concrete is the spring of its development. Hence arise differences, which however ultimately vanish into unity. There is both movement, and repose in the movement. The difference scarcely becomes apparent before it disappears, whereupon there issues from it a full and concrete unity. Of this he gives the following illustration:—the flower, notwithstanding its many qualities, is one; no single quality that belongs to it is wanting in the smallest of its leaves, and every portion of the leaf possesses the same properties as the entire leaf. He then observes, that although this union of qualities in sensible objects is readily admitted, it is denied in immaterial objects, and held to be irreconcilable. Thus it is said that man possesses liberty; but that freedom and necessity are mutually opposed; that the one excluding the other, they can never be united so as to become concrete. But according to Hegel, the mind is in reality concrete, and its qualities are liberty and necessity. It is by necessity that man is free, and it is only in necessity that he experiences liberty. The objects of nature are, it is true, subject exclusively to necessity; but liberty without necessity is an arbitrary abstraction, a purely formal liberty.

This concrete idea develops itself in obedience to certain laws which it determines of itself. Among these Hegel distinguishes three species of thought, or three productions of thought in general. 1, the *thought*, which he calls formal, as considered independent of its subject-matter, or, in the Hegelian terminology, of all its *contents*; 2, the *notion*, which is thought more closely determined; and, 3, the *idea*, or thought in its totality and fully determined. The truth, determined in itself, experiences a want of development. The idea, concrete and self-developing, is an organical system, a totality comprising in itself vast treasures of degrees and *momenta*, or germs of further development. Now philosophy is nothing else than the knowledge of this development, and, in so far as it is methodical and self-conscious thought, it is the development itself. With the progress of this evolution, philosophy advances towards perfection. The more the idea develops itself the more precise and limited does it become, the wider its expansion and the deeper its intensity. All the partial results it gives rise to, as well as their systematisation, proceed from the one identical *idea*. Particular systems are but so many diversified forms of the same *life*; they have no reality but in this unity, and their differences and their specific determinations taken collectively are but the expression of the forms contained in the idea. The idea is at once the centre and the circumference—the source of light, which in all its expansions does not pass out of itself; it is both the system of necessity and its own necessity, and yet nevertheless liberty.

In the history of philosophy we have, under the form of accidental succession, the actual development of philosophy itself. In the different systems which the history records there is one and the same philosophy at different degrees of its development, and the different principles which have been employed to support these systems are but branches of a single unity and of one whole. The philosophy therefore which is the last in time is the result of all preceding systems, and consequently must comprise the principles of all, and therefore it is the most perfectly developed, the richest, and the most 'concrete.' The more concrete the idea becomes, the more widely extended is the domain of science. It reconciles the apparent inconsistencies of appearance and reason, and a true philosophy removes the contradiction in which the ancient philosophy was involved with the natural and historical development of the human mind. Starting from and nourished by experience, the thought rises to the idea of the general and the absolute, and, being allowed its free course, passes beyond the moment of doubt and difficulty, to reproduce all that it has conceived in a rational order, and to impress upon it the stamp of a logical necessity. For all verity is virtually contained in thought, from which, being made fruitful by experience, it is the duty of philosophy to draw it, and to deduce the actual consciousness. Accordingly it is the high pretension of the Hegelian philosophy to reconcile philosophy with reflection, and positive religion with the state and with every political and religious establishment. It is, he observes, an evil prejudice to suppose that true philosophy is opposed to the sober results of experience, and to the rational enactments of actual laws.

Hegel divides philosophy into three parts:—1, Logic, or the science of the idea in and by itself, or in the abstract element of pure thought; 2, Philosophy of nature, or the science of the idea out of itself—or in nature, or as nature; 3, Philosophy of mind, or the science of the idea in its return into itself. Into the details of this division it would be idle to enter, as it would only lead to a dry and barren nomenclature. Each part is again divided into three parts; for this holy number determines throughout the divisions and subdivisions of the system. In this respect, as well as for his obscurity and neologism, Hegel well deserves the reproach of Wolfianism, which his master Schelling has urged against him, Schelling indeed disavowed him as his disciple,

which honour however Hegel still loved to claim with a satisfaction mingled with regret.

HEGESIAS (*Hēgias*), a Greek rhetorician and historian, was a native of Magnesia, and lived about the time of the historian Timæus, that is, about B.C. 250. Respecting his life no particulars are known, but as an author he appears to have been of some importance in antiquity, though more for his bad than for his good qualities. Strabo (xiv. p. 648) calls him the founder of that florid and inflated style of oratory which was afterwards designated by the name of the Asiatic; and this testimony is borne out by Cicero ('*Brut.*' 83; '*Orat.*' 67, 69) and others. Hegesias himself pretended to imitate the Attic orators, especially Lysias. He seems to have been destitute of all the qualities required of an orator, and to have taken a great delight in childish conceits and a pretty way of expressing them. This we must conclude both from the opinions of ancient critics as well as from the few specimens of his oratory which have come down to us, and are preserved in Dionysius ('*De Compos. Verb.*' 4, 18) and Photius ('*Biblioth. Cod.*' 250). As an historian he appears not to have been much better than as an orator. The subject which he chose was the history of Alexander the Great, but that he had no notion of the dignity of history is evident from the specimens given by Dionysius, Photius, and Plutarch ('*Alex.*' 3); and A. Gellius (ix. 4) does not appear to be much mistaken in classing him among those who, unconcerned about historical truth, filled their books with marvellous occurrences and incredible stories. (Compare Strabo, ix. p. 396; Longinus, '*De Sublim.*' 3; Theon, '*Progymnasim.*' 2; St. Croix, '*Examen critique des Historiens d'Alexandre*, p. 47, &c.)

From this Hegesias we must distinguish HEGESIAS 'the Cyrenaic philosopher,' who lived somewhat earlier, in the reign of Ptolemæus Philadelphus, and was a disciple of Paraebates. His doctrines however differed in several points from those of other Cyrenaics, and so much so that his followers were regarded as a distinct school, and are called as such Hegesiaci. In the main points they agreed with Aristippus, the founder of the Cyrenaic school, who maintained that pleasure was the great object of man's life; but Hegesias and his school went further; they denied that kindness, friendship, and benevolence had any independent existence, but that they arise and disappear with our feeling of the want of them. Happiness, they said, is a thing impossible to attain, for our body is subject to many sufferings, and the soul suffers with it. Life and death are equally desirable; nothing is by nature either agreeable or disagreeable, but becomes so through the circumstances in which a man lives. A wise person therefore looks upon life with indifference, and regards nothing and nobody so much as himself, reducing everything to his own convenience. This miserable view of human life was somewhat softened down and improved by Anniceris, the disciple of Hegesias. Hegesias wrote a work entitled *Ἀποκαταστάσις*, in which he introduced a person resolved to starve himself, and explaining to his friends why death was more desirable than life. He seems to have taught philosophy at Alexandria, but as in consequence of his doctrines many persons destroyed themselves, King Ptolemy Philadelphus is said to have forbidden him to teach any more. (Diogenes Laert., ii. 86, 93-96; Cicero, '*Tuscul.*' i. 34.)

HEIBERG, PETER ANDREAS, a Danish dramatic and miscellaneous writer of considerable reputation, the husband of a lady whose novels are of great excellence, and the father of a dramatic writer [HEIBERG, JOHAN LUDWIG] whose works have been more successful than his own. Peter Andreas was born on the 16th of November 1758, at Vordingborg in Sjælland, and is thus by birth a Dane, though he has often been taken for a Norwegian, owing to his having spent much of his early life in Norway, and published in later life a political work in French under the title of '*Lettres d'un Norvégien de la vieille roche.*' He was established at Copenhagen as an official translator in 1783, and continued a resident at that city till 1799, when he was banished from the Danish dominions by a judicial sentence for seditious expressions contained in some of his poetical works. He took up his residence in Paris, and there obtained employment in the department of foreign affairs under Napoleon I.; his knowledge of northern languages and affairs rendering him a useful clerk to Talleyrand, whom he frequently accompanied in his negotiations in Germany. The fall of Napoleon led to the dismissal of Heiberg, but not to the loss of a pension for his services to the French government, on which he continued to subsist at Paris till his death in that city on the 30th of April 1841. His wife, Thomasina Christina Buntzen, who remained at Copenhagen on his banishment, and contracted a fresh marriage, died in or about 1856, and was the author of '*An Every-Day Story*' ('*En Hverdags-Historie*'), and of a series of anonymous novels which followed it, which ran through numerous editions, and were collected in several volumes under the title of '*Novels by the Author of an Every-Day Story.*' They are considered by the Danes the most lively and truthful delineations of Danish society ever written; and it is singular that up to the present moment, though many foreign works of inferior merit have had great success in England, the works of this '*Danish Miss Austen*' have not met with an English translator. The dramatic works of Peter Andreas were collected and published by his friend the critic Rahbek, in 4 vols.: '*Samlede Skuespil*,' Copenhagen, 1808-19. The comedy of '*Heckingborn*,' and the two operettas '*The Voyager to China*' and '*The Solemn Entry*,' are regarded as the

most successful. Heiberg's later works in the Danish language were published in Norway, and two of them, '*Three Years in Bergen*' and some reminiscences of his career in the French service, are of an autobiographical character. He wrote in French, a '*Précis historique de la monarchie Danoise*,' and for several years accounts and criticisms on the current Danish literature in the '*Révue Encyclopédique.*' At the time of the union of Norway to Sweden, at the close of the war in 1814, a series of articles from his pen, remonstrating on the part taken by England in the affair, appeared in English in the '*Globe*' London newspaper. His '*Lettres d'un Norvégien*' (Paris, 1822), which have been already mentioned, and a work in Danish against capital punishment, are the most important of his remaining works, of which a complete list will be found in Erslev's '*Forfatter-Lexikon.*'

*HEIBERG, JOHAN LUDWIG, a Danish metaphysician and comic dramatist, was born at Copenhagen on the 14th of December 1791. At the age of eight years he lost the care of his father [HEIBERG, PETER ANDREAS], who was banished for sedition, and emigrated to France. The next two years of the boy's life were spent under the roof of his father's friend, the indefatigable Knud Lyne Rahbek, whose house was at that time the usual place of assemblage for half the literary men of Copenhagen. From Rahbek's he went to school, and at the age of thirteen took up his residence with his mother, who, remaining in Denmark after the banishment of her husband, had married another banished man, the Swedish Count Ehrensvärd, one of the conspirators against Gustavus III., who resided at Copenhagen under the name of Gyllenberg. The house of Madame Gyllenberg was the favourite resort of Oehlenschläger and Oersted, and young Heiberg found himself again surrounded with the best literary society. In 1811 he produced his first drama, '*Tyge Brahes Spaadom*,' or '*Tycho Brahe's Prediction*,' and in 1816 another, '*Julespøg och Nytaarslöier*' ('*Christmas Fun and New Year's Laughter*'). He had taken a degree at the university in 1809, and in 1817 he wrote a characteristic dissertation for the attainment of the doctorate in philosophy: '*De pœeseos dramaticæ generis Hispanico et præsertim de Petro Calderone de la Barca, principe dramaticorum.*' At the age of twenty-seven he was still without a profession, and afterwards said that he did not know himself if he should become "a poet or a critic, a physician or a naturalist, a diplomatist or a surveyor." From this embarrassment he was relieved by receiving from government a travelling pension, which enabled him to pay a short visit to London, and to stop three years at Paris, where he lived at his father's, and saw much of the best Parisian society. At Paris he earned part of his living as a professor of the guitar; and on his return to Denmark in 1822 he obtained the post of professor of the Danish language at the University of Kiel, in Holstein. The dullness of a residence in the provinces was insupportable to him, and he threw up the situation after three years. In the meantime he had directed his attention to metaphysics, and took a trip to Berlin to make himself personally acquainted with Hegel and the Hegelian philosophy, but was returning home unable to comprehend it when, according to his own account, the "central thought" of the whole system flashed on him all at once in a moment at Hamburg. Another thought which occurred to him about the same time was, to try to introduce on the Danish stage an imitation of the French vaudevilles. The first drama of the kind—'*King Solomon and the Hatter*,' produced in November 1825—had the most brilliant success, and was acted more than fifty times. It was speedily followed by several others—'*The Danes in Paris*,' '*No*,' &c., and in 1828 by '*Elverhøi*,' or '*The Fairies*' Hillock, a play in five acts: the success of all of which was so decided that in 1829 he received the appointment of Royal Dramatic Poet and Translator, an important official post connected with the theatre. Two years after he married Johanne Louise Patges, a rising actress, who is now, as Madame Heiberg, considered the principal ornament of the Danish stage. In 1830 he was appointed teacher of logic, æsthetics, and Danish literature at the Military High-School. Since that period Heiberg has produced several works of reputation in both the drama and philosophy, and is still one of the leading personages of Danish literature. In his '*New Poems*,' published in 1841, '*A Soul after Death*' was particularly noticed. His '*Outlines of the Philosophy of Philosophy, or Speculative Logic*,' were followed by a periodical under the name of '*Perseus, or a Journal for Speculative Ideas*,' commenced in 1837, but which was not of long duration. A periodical of a different kind, '*The Flying Post of Copenhagen*,' which was edited in 1827 and 1828 and also at a later date by Heiberg, was eminently popular. In it first appeared, anonymously, the '*Every-Day Story*,' which is considered one of the finest of Danish novels, the authorship of which and of those which followed it by the same hand was often attributed to Heiberg himself till it was ascertained that they were from the pen of his mother, Madame Gyllenberg. The position of women in society has been one of the subjects that have recently engaged his attention, and several pamphlets for and against the doctrines which he advocates have testified to the interest which his views awaken in the Danish public. A collection of his works up to that time was published more than ten years ago.

HEINE, HEINRICH, was born on the 1st of January 1800 at Düsseldorf, in the Prussian Rhine-Province, of Jewish parents. His father was a merchant. He was educated at the Lyceum at Düsseldorf, and as he was intended for the mercantile profession, he was

sent in 1816 to Hamburg, to receive the necessary instruction and training. He remained there till 1819, when his father, as well as his uncle, Salomon Heine, a banker in Hamburg, acquiesced in his wish to be educated for a literary profession, and in the summer of that year he was sent to the university of Bonn, in order to study jurisprudence. In 1820 he went to Göttingen, but soon left it, and in 1821 removed to Berlin, where, in 1822, he published the first collection of his poems, 'Gedichte, von Heinrich Heine,' 12mo. Some of the earliest of these productions date as far back as 1816, and several of them had previously appeared in the periodical called 'Der Wächter' at Hamburg. He travelled in Poland in 1822, and after his return to Berlin published his remarks in the 'Gesellschafter.' In 1823 he published his tragedy of 'Almansor,' together with a one-act tragedy named 'William Radcliff,' and a 'Lyrisches Intermezzo.' While he remained at Berlin he also published in 'Der Sprecher' a series of letters under the head of 'Briefe aus Berlin,' which attracted much attention. In 1823 he returned to Göttingen, and resumed his studies in jurisprudence. On the 30th of July 1825 he took a degree in law, and then proceeded to Hamburg, for the purpose of establishing himself there as an advocate. The practice of the law however seems to have been as little suited to the character of his mind, now developing itself, as the pursuits of trade. He appears about this time to have renounced the religion of his ancestors for that of the New Testament, in the Lutheran form, but afterwards became an unbeliever. While at Göttingen, in 1824, he had made a tour in the Harz Mountains, of which he published an account at Hamburg, 'Die Harzreise,' 1826. He afterwards made tours to the islands of the Baltic, to England, to South Germany, and to Italy, and wrote a descriptive account of each. The whole of these, including the 'Harzreise,' were published at Hamburg under the title of 'Reisebilder,' vols. 1-2 in 1826-27, and vols. 3-4 in 1830-31. These works he himself many years afterwards translated into French under the title of 'Impressions de Voyages.' In 1827 he published at Hamburg another volume of short poems, the 'Buch der Lieder,' and about the same period his poem of 'Alta Troll, ein Sommernachtstraum.' After his return from England he was employed at Stuttgart as the editor of the 'Neue Politischen Annalen.' He also wrote for the 'Morgenblatt' and the 'Augsburger Zeitung,' and of the latter he became afterwards the Paris correspondent.

In 1831 Heine removed to Paris, where he continued to reside during the remainder of his life. In this year he published his series of letters 'On Nobility' ('Ueber den Adel'), Hamburg, 1831. In 1833 appeared his essays on modern literature in Germany, 'Zur Geschichte der Neueren Schönen Literatur in Deutschland,' 12mo, Paris and Leipzig, and his remarks on the state of France, 'Französische Zustände,' 12mo, Hamburg, which is a collection of articles previously published in the 'Augsburger Gazette.' 'Der Salon,' one of the most important of his prose works, was published at Hamburg, in 4 vols. 8vo, 1834-40. About this period he married a Frenchwoman, who was a Roman Catholic, and married her according to the Roman Catholic ritual. His observations on the 'Romantic School' ('Die Romantische Schule') appeared in 1836 at Hamburg. In 1840 he published his bitter personal attack on Börne, with whom he had become acquainted when he went to Paris in 1831, 'Ueber Ludwig Börne,' 8vo, Hamburg.

In the winter of 1843-44, Heine visited Germany for the last time. After his return to Paris he published his 'Deutschland, ein Wintermärchen' ('Winter's Tale'), which is a description of his journey. In 1847 he experienced an attack of paralysis, which deprived him of the sight of one eye; in other respects he recovered, but another attack in 1848 deprived him of the sight of the other eye also, and subjected him likewise to extreme bodily suffering, without at all injuring his mental faculties. He never afterwards left his chamber, but continued his literary labours by the aid of an amanuensis, with a cheerful resignation which was only interrupted occasionally by the severity of his sufferings. His latest poetical productions were the 'Romancero,' written in 1850-51; 'Das Buch des Lazarus,' written in 1854, and 'Neuer Frühling' ('New Spring'), written in 1855. In July 1855 he published at Paris, in the 'Bibliothèque Contemporaine,' a translation of his poems into French prose, under the title of 'Poèmes et Legendes, par Henri Heine.' The translations were made under his own supervision by his friend, the late Gérard de Nerval. A similar translation of the 'Neuer Frühling' appeared in the 'Revue des Deux Mondes,' vol. xl, 1855. His state of bodily suffering, during which he was dutifully attended by Madame Heine, was terminated by his death, on the 17th of February 1856.

Soon after Heine's death, his brother, Dr. Gustav Heine, of Vienna, communicated to the 'Freundenblatt' of that city some particulars of his last moments, together with the seventh clause of his will, in which he says, "Though I belong to the Lutheran confession, I do not desire to be followed to the grave by any clergyman of that denomination, and I wish to dispense with any other sacred solemnity at my burial. This is not the weak fancy of a freethinker. For the last four years I have cast aside all philosophical pride, and have again felt the power of religious truth." He regrets having so often spoken of sacred subjects in a disrespectful manner, and implores "forgiveness for any offence which in his ignorance he may have given to good manners and morals, which are the true emanations of all faith."

Heine wrote French with apparently as much facility as his native

language, and was a contributor to the periodicals of Paris as well as to those of Germany. His prose-works are distinguished by great brilliancy of style and vividness of imagination, but are too often pervaded by a spirit of sarcasm which has no respect for persons, and are frequently traversed by veins of mockery which touch the most sacred subjects. His poems are distinguished by originality, freshness of feeling, fine fancy, and extraordinary beauty of versification, and will probably endure long after his prose, from its want of sincerity, has fallen into comparative neglect. The best as well as the most recent translation of his smaller poems is 'Heinrich Heine's Book of Songs, a Translation by John E. Wallis,' 12mo, London, 1856.

HEINECCIUS, JOHN GOTTLIEB, born at Eisenberg, in Saxony, in 1681, was one of the most learned jurists that Germany has produced. He was appointed professor of philosophy at Halle in 1713, and was afterwards professor of law at Franeker in West Friesland, which place he left in 1727 on account of ill-health. He was then appointed professor of law at Frankfurt-on-the-Oder, and lastly he filled the same chair at Halle, where he died in 1741. His principal works are:—1. 'Antiquitatum Romanarum Jurisprudentiam illustrantium Syntagma, secundum Ordinem Institutionum Justiniani digestum, in quo multa Juris Romani, atque Auctorum Veterum loca explicantur atque illustrantur,' 8vo, 1741; a very useful work, which has since been edited by Haubold, 1822. 2. 'Elementa Juris Civilis, secundum Ordinem Institutionum.' 3. 'Elementa Juris Civilis secundum Ordinem Pandectarum, commoda Auditoribus Methodo adornata.' This work, which comprises a course of civil law, explains the origin, object, and application of the various laws. 4. 'Historia Juris Civilis Romani ac Germanici,' published with Ritter's notes, Leyden, 1748. 5. 'Elementa Juris Germanici, tum Veteris tum Hodierni,' 2 vols. 8vo, Halle, 1736. 6. 'Corpus Juris Germanici Antiqui,' 4to, 1738. 7. 'Prolectiones Academicæ in H. Grotii de Jure Belli et Pacis libros.' 8. 'Elementa Juris Naturæ et Gentium,' translated into English under the title of 'A Methodical System of Universal Law, or the Law of Nature and Nations, deduced from Certain Principles and applied to Proper Cases,' by G. Turnbull, 2 vols. 8vo, London, 1763. 9. 'Fundamenta Styli Cultioris.' 10. 'Elementa Philosophiæ Rationalis et Moralis,' besides academical dissertations, &c. The works of Heineccius were collected and published at Geneva, 'Opera Omnia,' 9 vols. 4to, 1771, with additions and notes by his son, John Christopher (Gottl.) Heineccius who prefixed to the first volume a life of his father.

HEINECKEN, or HEINECKE, CHRISTIAN HEINRICH, born at Lübeck the 6th of February 1721, was the son of a painter, Paul Heinecken, and younger brother of Karl Heinrich Heinecken, also an artist, and a writer on the fine arts. Christian Heinrich was an extraordinarily precocious child. At the age of ten months he could speak and repeat every word which was said to him; when twelve months old he knew by heart the principal events narrated in the Pentateuch; in his second year he learned the greater part of the history of the Bible, both of the Old and New Testaments; in his third year he could reply to most questions on universal history and geography, and in the same year he learned to speak Latin and French; in his fourth year he employed himself with the study of religion and the history of the Church, and he was able not only to repeat what he had read, but also, it is affirmed, to reason upon it, and express his own judgment. The fame of this wonderful child spread widely, and many persons resorted to Lübeck on purpose to see and hear him. The King of Denmark wishing to see him, he was taken to Copenhagen, and there examined before the court, and pronounced to be a wonder. On his return home he learned to write, but his constitution being weak, he shortly after fell ill. Though he rallied for a time, he soon relapsed, and died on the 27th of June 1725, without, it is said, showing much uneasiness at the approach of death. His teacher, Christian von Schöneich, published a narrative of his life, 8vo, Lübeck, 1726, and his account is confirmed by many respectable contemporary authorities; among others—Hirsching, in his 'Historisch-literarisches Handbuch,' 3rd part, pp. 62-64; the 'Deutsche Bibliothek,' vol. xvii; and by most of the journals of the time. See also Jöcher, 'Gelehrtenlexicon,' vol. ii., p. 1454; and the 'Allgemeine Encyclopädie der Wissenschaften und Kunst,' Leipzig, 1829, art. 'Heinecken.' Martini published a dissertation at Lübeck, 1730, in which he endeavoured to account for the circumstances of the child's early development of intellect.

HEINRICH, CARL FREIDRICH, a distinguished German scholar, was born on the 8th of February 1774, at Moschleben, in the duchy of Saxe-Gotha, where his father was pastor. He received his first education at the Klosterschule of Dondorf, and afterwards at the Gymnasium of Gotha, where he enjoyed the instruction of Döring, Manse, Jacobs, and other eminent scholars. Heinrich had read the principal Greek writers even before he entered the gymnasium, and his intimate acquaintance with them caused him to be looked upon as a wonderful boy. In 1791 he went to Göttingen, where he became the favourite pupil of Heyne, who made him the tutor of his son. In 1795 Heinrich was appointed teacher at the Gymnasium of Breslau, and in 1801 he obtained the title of professor. Böttiger, the eminent archaeologist, persuaded him to take an interest in the theatre at Breslau, and Heinrich not only exerted himself to raise its character, but wrote several dramas for it, and in the end became one of the managers of the theatre. In 1804 Heyne procured him the professorship of eloquence and of Greek in the University of Kiel. Philological studies had

been greatly neglected there, and Heinrich at first lectured to empty benches, but he soon attracted a great concourse of students. In 1819 he was invited to a professorship in the newly-established University of Bonn. He accepted the offer, and henceforth continued to lecture there until his death on the 20th of February 1838.

Heinrich was a very excellent Latin scholar, though his lectures on Latin authors are very unequal. The best were those on the Satires of Horace, Juvenal, and Persius, for he himself had great satirical talent; his explanations always excited a most lively interest, being seasoned with his own wit and sarcastic allusions. The philological seminary of Bonn was much indebted to his exertions; but his personal character was anything but amiable—he was whimsical, inconstant, and not unfrequently malicious. He published few works, but all of them have great merit; the following is a list of them:—1. 'Epimenides aus Creta, eine kritisch-historische Zusammenstellung aus Bruchstücken; nebst Zwei kleinern antiquarischen Versuchen,' Leipzig, 1801, 8vo; an excellent critical essay on the life of Epimenides and the works attributed to him. 2. 'Lycurgi Oratio in Leocratem,' Bonn, 1821, 8vo. 3. An edition of Cicero's treatise 'De Re Publica,' Bonn, 1823, 8vo, with an extensive critical commentary. He further wrote critical essays in several periodical works, and was one of the editors of Köppen's 'German Commentary on Homer,' in 6 vols., Hanover, 1794-1823. In the year after Heinrich's death his edition of Juvenal, for which all preparations were made before, was published by his son, in 2 vols. 8vo, Bonn, 1839, which is the best edition of Juvenal that we have. (See Long, in the 'Classical Museum,' vol. i. p. 369, &c.) An edition of Persius, for which Heinrich had likewise left the manuscript ready, was published by Otto Jahn.

HEINSE, WILLIAM, was born at Langewiesen, near Ilmenau in Thuringia, in 1749. After passing through a course of legal studies at the University of Jena, he took up his residence at Erfurt, where, being encouraged to apply himself to literature by Wieland, he commenced his career as an author by a translation of Petronius (1773), which was quickly followed by 'Laidon, or the Eleusinian Mysteries.' The choice he had shown in selecting the first-mentioned work, together with the fidelity with which he adhered to the original, and also many parts of the other, scandalised not only the public, but Wieland himself. His next productions were less objectionable for their tendency, being a prose translation of Tasso's 'Jerusalem,' and another of Ariosto's 'Orlando,' both which he is said to have executed during his residence in Italy (1780-83); but these tasks did not prevent him from giving full scope to his unrestrained passion for enjoyment, and with what license he abandoned himself to the gratifications which Italy—long the object of his wishes—presented to him, may easily be inferred from his 'Ardinghello,' which may be considered in some degree as the record of his own feelings and opinions, and while it gives us much eloquent and impassioned criticism on art, abounds not only with the most dissolute scenes, but with maxims immoral in the extreme. Fortunately the narrative and incidents are so interrupted by the dialogues and disquisitions on art, that the work can hardly be classed as a romance; for most of the scenes and characters which belong to it as such are calculated only to corrupt. However, if we estimate the critic apart from the novelist, Heinse must be allowed to have here manifested an extraordinary sympathy for art; and although some of his views of it may be erroneous, he is always original, forcible, and enthusiastic. His 'Dialogues on Music' were not published till after his death, which happened on the 22nd of June 1803. Besides another romance, entitled 'Hildegard,' he contributed a variety of articles to the 'Deutsche Mercur,' and other periodicals, including a critical account of the principal pictures of the Düsseldorf Gallery, in a series of letters to Gleim. A complete edition of his works has been published in 10 vols. 8vo, with a critical and biographical introduction by Laube.

HEINSIUS, DANIEL, was born at Ghent in 1580 or 1581. He was taken to England at an early age by his father, who was obliged to leave Holland in consequence of the part he took in the wars which then prevailed in his native country. His father returned to Holland after a short time, and sent his son, at the age of fourteen, to study law at Franeker. But Heinsius, contrary to the wish of his father, resolved to study ancient literature; and accordingly, after remaining at Franeker only six months, he went to Leyden, where he prosecuted the study of the classics under Joseph Scaliger. At the age of eighteen he explained the Latin classes in the university, and seven years afterwards was appointed professor of history and politics. In 1607 he was made librarian and secretary to the university. Heinsius was considered one of the most learned men of his time, and was repeatedly solicited by many of the monarchs of Europe to settle in their dominions; but he refused to leave his native country, in which he died on the 23rd of February 1655, at the age of seventy-five. He held the office of historian to the states of Holland, from which he received a handsome salary. He also took an active part in the theological warfare of the times, and was appointed secretary to the celebrated synod of Dort in 1618.

The name of Heinsius is principally known by his editions of the

Greek and Roman classics. But his Latin poems, which are seldom read in the present day, were highly esteemed by his contemporaries; they were published at Leyden in 1602. He also wrote some poems in his native language, which were published by Petrus Scriverius in 1616.

The following is a list of the principal classical authors edited by Heinsius:—'Crepundia Siliana, sive notæ in Silium Italicum,' 1600; 'Theocritus,' 1603; 'Hesiod,' 1603; 'Paraphrasis Andronici Rhodii in Aristotelis Ethica,' 1607, 1617; 'Maximi Tryrii Dissertationes,' 1607, 1614; 'Dissertatio de Nonni Dionysiaca,' 1610; 'Seneca Tragediæ,' 1611; 'Aristotelis Poetica,' 1611, 1643; 'Theophrastus Eresius,' 1611, 1613; 'Horatius et de Satira Horatiana,' 1612; 'Animadversiones et Notæ in Horatii Opera,' 1629; 'Notæ et Emendationes in Clementem Alexandrinum,' 1616; Terence, 1618; 'Paraphrasis Perpetua in Politicâ Aristotelis,' 1621; 'Aristarchus sacer, sive Exeritationes ad Nonni Paraphrasin in Johannem,' 1627; Ovid, 1630, 1653, 1661; Livy, 1620, 1631, 1634; Aurelius Prudentius, 1637; 'Exeritationes Sacrae ad Novum Testamentum,' 1639. Heinsius was also the author of 'Rerum ad Sylvam Ducis atque alibi in Belgia aut a Belgis anno 1629 Gestarum Historia,' fol., Leyden, 1631; 'Orationes varii Argumenti,' 12mo, Leyden, 1615, 1620.

HEINSIUS, NICHOLAS, only son of Daniel Heinsius, was born at Leyden, 29th of July 1620. His education was carefully attended to by his father, and he enjoyed the advice and instruction of Gronovius, Grotius, and other learned men of the time. Nicholas Heinsius visited England in 1642, and afterwards went to France, Germany, and Italy, principally with the view of consulting manuscripts of Ovid and Claudian. In 1649 he was invited by Christina, queen of Sweden, to settle at Stockholm, where he remained till the death of his father in 1655. He resided principally in Holland during the remainder of his life. He was sent on a public mission to Russia in 1667. He died on the 7th of October 1681.

Heinsius edited Claudian, 1650, 1665; Ovid, 1652, 1661; Virgil, 1676; Valerius Flaccus, 1680. His Latin poems were published at Amsterdam in 1666. He also left behind him many manuscript notes on the Latin poets, which have been published by Burmann, in his editions of Virgil, Valerius Flaccus, Silius Italicus, Phædrus, &c.

(*Life of Heinsius*, prefixed to Burmann's 'Adversaria,' 4to, 1742.)

HE'LENA, ST., the first wife of Constantius Chlorus, was born of obscure parents, in a village called Drepanum in Bithynia, which was afterwards raised by her son Constantine to the rank of a city, under the name of Helenopolis. Her husband Constantius, on being made Cæsar by Diocletian and Maximianus (A.D. 292), repudiated Helena, and married Theodora, daughter of Maximianus. Helena withdrew into retirement, until her son Constantine, having become emperor and triumphed over his enemies, called his mother to his court, and gave her the title of Augusta. He also gave her large sums of money, which she employed in building and endowing churches and in relieving the poor. About the year 325 she set out on a pilgrimage to Palestine, and having explored the site of Jerusalem, she thought that she had discovered the sepulchre of Jesus Christ, and also the cross on which he died. The identity of the cross which she found has very reasonably been much doubted; she however built a church on the spot supposed to be that of the Sepulchre, which has continued to be venerated by that name to the present day. She also built a church at Bethlehem in honour of the nativity of our Saviour. From Palestine she rejoined her son at Nicomedia, in Bithynia, where she expired in the year 327, at a very advanced age. She is numbered by the Roman Church among the saints. (Eusebius, *Life of Constantine*; Hübner, *De Crucis Dominicæ per Helenam inventionem*, Helmstädt, 1724.)

HE'LENA, daughter of Constantine the Great and of Fausta, was given in marriage by her brother Constantius to her cousin Julian, when he made him Cæsar, at Milan, A.D. 355. She followed her husband to his government of Gaul, and died in 359 at Vienne. The historian Ammianus Marcellinus (b. xvi., c. 10) reports that the Empress Eusebia bribed Helena's midwife, who occasioned the death of a son, the only child that Helena bore; and yet Eusebia had been the constant protectress of her husband Julian. The truth of the story is doubted by Gibbon, in his 'Decline and Fall' (ch. xix.).

HELIODORUS, was born at Emesa in Syria, in the fourth century of the Christian era. He was bishop of Tricca in Thessaly, and is said to have introduced into his diocese the custom of deposing from their office all priests who lived with their wives after their ordination.

He wrote in his youth a romance in the Greek language entitled 'Æthiopia,' which contains an account of the wonderful adventures of two lovers, Chariclea, the daughter of Hydaspes, king of Ethiopia, and Theagenes, a noble Thessalian. It has been remarked that the work of Heliodorus served as a kind of model to the subsequent Greek writers of romance. Though without merit in point of style and animated description, it belongs to that kind of works of fiction which deal in improbabilities and strange adventure. This work was published for the first time by Obsopoeus, 4to, Basel, 1534; afterwards by Commelinus, 8vo, 1596, and has been many times reprinted: the best edition is by Coraëa, 2 vols. 8vo, Paris, 1804. The 'Æthiopia' has been translated into most of the modern European languages. At least half a dozen other Greek writers of the name of Heliodorus are mentioned.

HELIOGABALUS. [ELACABALUS.]

HELL, MAXIMILIAN, a distinguished astronomer and member of the order of Jesuits, was born May 15, 1720, at Schemnitz in Hungary, and manifested, at an early age, a decided taste for the study of natural philosophy and astronomy. At twenty-five years of age he was employed as an assistant in an observatory belonging to the Jesuits at Vienna, and he was at the same time keeper of the museum of experimental philosophy which had just then been formed in that city. In 1746 he was made rector of an academy at Leutschau in Hungary; but this post he held only one year, when he returned to Vienna. Here he completed his theological studies, and received a small number of pupils, whom he instructed in mathematics. He took orders in 1751, and after three years obtained the rank of doctor, with an appointment to the professorship of mathematics at Clausenburg in Transylvania. Having continued in this situation four years, he again returned to Vienna, where he was established in an observatory which had been built in conformity to his own directions; and he held the appointment during the remainder of his life. Besides the duty of making celestial observations, he was charged with that of giving lessons in mechanics; as, in England, about eighty years earlier, the first astronomer royal was required to teach the use of nautical instruments to two boys from Christ's Hospital: the German astronomer however gave the lessons only during one year, his time afterwards being fully occupied in performing services more important to science.

Through the mediation of Count Bachoff, who was sent from Copenhagen for the purpose of making the proposal, he accepted an invitation from the court of Denmark to undertake a journey to Wardhuys in Lapland, in order to observe there the transit of Venus over the sun's disc. Accordingly he set out from Vienna in 1768; and, after staying a short time at Copenhagen, he proceeded to the place of his destination: he was absent about two years and a half on that mission, when having fully succeeded in its object, he returned to Vienna. Besides observing the transit, Hell took advantage of his residence in Lapland to study the geography, the natural history, and the climate of the country; the history, language and religion of the people, with the state of the arts among them: he made also numerous observations on terrestrial magnetism, on the phenomena of the tides and winds, and on the variations of the barometrical column; and he measured the heights of the principal mountains. After his return he prepared a work containing a full account of his researches, which was to have been published in three volumes, 4to, but it never appeared.

Hell was very fortunate in the sky being favourable, on the day (June 3, 1769) that the transit took place, so that he was enabled to observe the interior contact at the commencement, and both the interior and exterior contacts at the termination of the phenomenon; and it is a proof of the accuracy of his observations that the value of the sun's parallax, which he deduced by comparing them with the corresponding observations at certain other places, agreed, within one-fifth of a second, with the value afterwards determined from comparisons with all the best observations which were made.

On accepting the engagement, Hell was enjoined by the Danish ministry to abstain from publishing any account of his observations till his return to Copenhagen, and till he had made all the requisite computations. The delay which, in consequence of this injunction, took place in making Hell's observations public, gave offence to Lalande, who had, by letters addressed to the different governments of Europe, greatly promoted the measure of observing the phenomenon at different places on the earth's surface; the two astronomers were however soon reconciled, and they continued to correspond with each other as before. Hell drew up a memoir relating to the transit, which was read before the Academy of Sciences of Copenhagen, November 24, 1769.

The principal work published by this astronomer was a series of Ephemerides in thirty-five volumes, 8vo, the collection being entitled 'Ephemerides Anni 1757-1791 ad Meridianum Vindobonensem Calculis definitis.' With the exception of two volumes, these contain appendices on astronomical subjects by himself or other scientific men, chiefly by Pilgram and Trisnecker; the former of whom edited the work during the absence of Hell in Lapland. The rest of his publications on astronomical subjects are as follow:—'Tabulæ Solares Nicol. Ludov. de la Caille cum Supplemento Reliquarum Tabularum,' 1763; 'Tabulæ Lunares Tob. Mayer cum Supplemento, etc.,' 1763; 'De Satellite Veneris,' 1765; 'De Transitu Veneris ante Discum Solis die 3 Jun., 1769, Wardochusii observato,' 1770; 'De Parallaxi Solis ex Observationibus Transitus Veneris, anni 1769,' 1773; and 'Methodus Astronomica sine Usu Quadrantis, etc.,' 1775. He also edited a collection, which had been made by Hallerstein, of the astronomical observations made by the Jesuits at Pekin from 1717 to 1752; this was published at Vienna, in 2 vols. 4to, in 1768.

Besides these works he published 'Elementa Algebrae J. Crivellii,' 8vo, 1745; 'Adjumentum Memoriae Manuale Chronologico-Generologico-Historicum,' 16mo, 1750; 'Elementa Arithmetice Numerice et Literalis,' 8vo, 1763; also a tract on the true magnitudes of the sun and moon when seen by the naked eye, 1775; and one on a 'New Theory of the Aurora Borealis,' 1776.

All his works were published at Vienna; and he died in that city,

April 14, 1792, being seventy-two years of age. A brother of Hell was a distinguished mechanician at Schemnitz, and the inventor of a sort of siphon for draining mines: this is described in the 'Mémoires de l'Académie des Sciences de Paris' for the year 1760.

(*Biographie Universelle*; Delambre, *Hist. de l'Astronomie au Dix-huitième Siècle*.)

HELLANICUS, one of the early Greek prose writers, was born at Mitylene in the island of Lesbos, B.C. 496 ('Gell.,' xv. 23). According to Lucian ('Macrob.,' c. 22) he lived to the age of eighty-five. Suidas says that he lived at the court of Amyntas, king of Macedon, together with Herodotus; but this statement is inaccurate, since there was no king of Macedon of the name of Amyntas during the lives of Hellenicus or Herodotus.

He wrote several works, which are frequently quoted by ancient writers; of which the most important appear to have been, a 'History of Argos,' arranged in chronological order, according to the successive priestesses of the temple of Hera in that city; a 'History of Attica, Cyprus, Æolia, and Lesbos;' an account of Phœnicia, Persia, Scythia, and other Eastern nations, and some geographical pieces. Hellenicus is mentioned by Thucydides (i. 97).

The fragments which remain of the writings of Hellenicus were published by Sturz, 8vo, Leip., 1787; 2nd edition, 1823; and in the 'Museum Criticum,' vol. ii., pp. 90-107, Camb., 1826.

HELMERS, JAN FREDERIK, a popular Dutch poet, one of whose works is still frequently reprinted and much read in Holland. He was born at Amsterdam in 1767, was educated for commerce, but after the success of an 'Ode to Night' and of a poem in three cantos entitled 'Socrates,' gave himself up to literature, and published his principal poem, 'De Hollandische Natie,' or 'The Dutch Nation,' not long before his death, which took place on the 26th of February 1813. The work is divided into six cantos, the first treating of morality, the second of heroism by land, the third of heroism at sea, the fourth of navigation, the fifth of sciences, and the sixth of fine arts, in all of which the 'Dutch nation' is represented as leaving all other nations immeasurably in the rear. In the sixth canto we are gravely told that "no Briton, no Gaul, no German, no Italian" will be admitted by the poet to excel his countrymen in the domain of the fine arts, but he condescends to add that there was one race "that even more than equalled it," and allows that the Greeks surpassed the Dutch. In another passage he calls attention to the fact that his countrymen could boast of a Vondel, when the barbarism of Shakspeare still sounded beautiful to British ears. The only excuse for the hyperbolic laudation of his countrymen which pervades the poem is that it was published at a period when Holland was lying crushed beneath the feet of Napoleon, and when a patriot might naturally revolt at the contempt with which he saw the real glories of his country treated. But though the poem contains passages of considerable merit, its continued popularity is not creditable to the fine feelings of taste, which in one passage the poet asserts is born with every Dutchman.

HELMONT, JOHN BAPTIST VAN, was born at Brussels in 1577, the youngest son of a noble family, who derived their name from an estate and castle in Brabant. He has left an account of himself prefixed to his 'Ortus Medicinæ,' published at Amsterdam in 1615, from which we learn that he was educated at the university of Louvain, and intended for the church; but was so dissatisfied with the course of study there that he refused to take a degree when only seventeen. He says he had studied Euclid and Copernicus, but had no relish for them. He next tried metaphysics, which suited him as little. At length he applied to the medical sciences, particularly botany and chemistry. He read he says Galen, Hippocrates, Avicenna, and Greek, Arabian, and modern authors, to the number of six hundred, and after ten years study took a medical degree at Louvain; after which, being then married, he retired to Vilvorde in 1609. There he employed himself in chemical investigations, and studied Paracelsus, but says he found only obscurity and error in him. His memoir is a curious mixture of devotion and insanity. He had arrived at the conclusion that all his books and his acquired knowledge were a "mass of stuff," and he prayed for and believed he had acquired spiritual help. He nevertheless effected some remarkable cures, particularly during a season of plague. For these he was arrested by the inquisition as a sorcerer, but successfully cleared himself; and to avoid a similar inconvenience he removed to Holland. He has been reckoned among the alchemists, and no doubt many of his experiments were in that direction; but he also effected some service in chemistry. It was he who first used the term gas to denote all elastic fluids which differ from atmospheric air; and he noticed some of the properties of what he called gas sylvestre, or carbonic acid gas. He stated that it is invisible, and fixed in bodies; and he attributed the phenomenon of the Grotto del Cane to its presence. He died December 30, 1644. He had published several works in his life-time; among them were 'De Magnetica Vulnerum Naturali et Legitima Curatione,' 1621; 'The Ternary of Paradoxes; the Magnetic Cure of Wounds, the Nativity of Tartar in Wine, and the Image of God in Man,' 4to, translated by W. Charleton in 1650. He likewise left a considerable number of his writings, which he strictly enjoined his son to have published in the state in which he left them. They were issued in folio in 1648, and are a continuous attack on the Galenists, but of very little value.

FRANCIS MERCURIUS VAN HELMONT, his son, who was born in 1618, and died in 1698, was also a physician, and the author of several works, which, like his father's, are more noticeable for their eccentricity than their value.

HELOISE. [ABELARD.]

*HELPS, ARTHUR, is a name less familiar to the British public than it will be when it is openly associated with certain writings which, in an anonymous form, have been widely read and highly admired. In 1841 a new English author made his modest debut in a work entitled 'Essays written in the Intervals of Business.' From the same pen there came 'Catherine Douglas; a Tragedy,' and 'King Henry the Second; an Historical Drama,' both published in 1843. The author's next publication was 'The Claims of Labour; an Essay on the Duties of the Employers to the Employed; to which is added an Essay on the Means of Improving the Health, &c., of the Labouring Classes.' This appeared in 1845, and was followed by 'Friends in Council: a Series of Reading and Discourse thereon,' 1847-49; to which were subsequently added two other works, namely, 'The Conquerors of the New World and their Bondsmen; being a Narrative of the Principal Events which led to Negro Slavery in the West Indies and America,' 1843; and 'Companions of my Solitude' (a kind of sequel to 'Friends in Council'), 1851. While these writings were being widely circulated, and the author was being spoken of under his assumed designation as the author of 'Friends in Council,' it was no secret in literary circles that the thoughtful writer was Mr. Arthur Helps, a gentleman of independent means, who had been educated at Trinity College, Cambridge (where he had graduated B.A. in 1835), had subsequently for some years held an official appointment in one of the chief departments of civil service, and had at length retired to enjoy literary and philosophic leisure on his property near Bishop's Waltham in Hampshire. As Mr. Helps, though he had published anonymously, never wished to conceal the fact of his being the author of the writings that have been mentioned, it has been thought no breach of etiquette by his friends to refer to him by name in connection with his literary successes; and recently he has given his own authority for this, by publishing one more extensive and elaborate work with his name on the title-page. This work, which is an expansion of one of those already named, is entitled 'The Spanish Conquest in America, and its relations to the History of Slavery and to the Government of the Colonies,' by Arthur Helps, 2 vols., 1855. Like all Mr. Helps' writings, it is remarkable for its simple English style and its calm wisdom; but, being on a larger scale than his essays, it permits the display of qualities not there so visible. It is, in fact, a valuable history; and those who know its merits, and who know also that Mr. Helps is still (1856) in the prime of life, augur from it many more admirable contributions to English literature from the same quiet and graceful pen.

HELVETIUS, CLAUDE-ADRIEN, was born at Paris in January 1715, and was educated at the Jesuits' College of Louis-le-Grand, where his earlier years were far from betokening those talents of shrewdness and observation which his writings subsequently exhibited. Having passed through a course of legal study, Helvetius was sent to his maternal uncle, D'Armancourt, directeur des fermes at Caen, in order to acquire a practical knowledge of finance, and he shortly afterwards obtained the lucrative appointment of fermier-général, through the influence of the queen, Marie Leczinsky, to whom his father was physician; but disgusted with the oppressive nature of its duties, which however he discharged with singular lenity, he resigned this situation, and purchased that of chamberlain to the queen's household. At this period Helvetius led a disorderly life, without having any elevated or moral end in view, though his general conduct was relieved by occasional acts of the noblest generosity. Into these excesses he appears to have been led by an inordinate vanity thirst for universal admiration. Thus, in order to gain the applause of the theatre, he danced on the public stage in the mask of Javiller (for masks had not yet been exploded by Voltaire), and his temporary study of mathematics was stimulated by the honours and attention which were lavished by the highest circles at Paris upon Maupertuis, after his return from a scientific visit to Lapland. Aspiring to rival the dramatic fame of Voltaire, he composed the tragedy 'La Conjuración de Fiesque,' and upon the appearance of Montesquieu's work, 'L'Esprit des Loix,' Helvetius declared that he too would raise a monument worthy to stand by the side of that of the philosophical legislator. But Helvetius was as kind-hearted as he was vain, and an act of beneficence was as dear to him for its own sake as the applause which he courted so eagerly. When Saurin the academicien married, Helvetius not only made him a free gift of 200*l.*, but also settled upon him an annuity of 80*l.*; and when Marivaux, to whom he allowed a yearly pension of 120*l.*, forgot the decencies of gratitude, Helvetius mildly observed, "How would I have answered him if he had not, by accepting my favours, laid me under an obligation to him!"

In 1751 Helvetius married the beautiful and accomplished daughter of the Comte de Ligneville, and niece of Madame de Graffigny, by whom she had been brought up. From this time he lived chiefly in retirement at a small estate at Voré, enjoying with his wife and children the pleasures of domestic life, and ameliorating the condition of his tenants and vassals. He is said to have been very jealous of the game on his estates, and very severe against violators of the game-laws. In

1758 he published the treatise 'De l'Esprit,' which, while it was favourably received by the self-styled philosophical party, was denounced by the court and the Jesuits as dangerous to society and to religion, and as being nothing less than a summary of all the evil doctrines of the 'Encyclopédie.' A strong passion for praise is usually accompanied by a keen sensibility to censure: to regain the favour of the court Helvetius thought no concession too great, and he successively published three letters of apology which gradually advanced in humility and submission. Notwithstanding the confession which they contained of a Christian faith, and his disclaimer of all opinions inconsistent with its spirit, the doctors of the Sorbonne drew up a formal condemnation of the work, which they declared to be a compendium of all the evil contained in all the bad books that had yet appeared. It was publicly burned, according to a decree of the parliament of Paris. As to the literary merits of this work, the style is vicious and declamatory, but the argument is well sustained throughout, and enforced by great felicity and copiousness of illustration. In 1764 Helvetius visited England, and in the following year Germany, where he was received by Frederick the Great with marks of the highest consideration and esteem. Helvetius died at Paris on the 26th of December 1771, leaving a work behind him entitled 'De l'Homme, de ses Facultés, et de son Éducation,' which was published the same year at London by Prince Gallitzin. Among the earliest works of Helvetius is his poem 'Sur le Bonheur,' which, however secondary as a poetical composition, evinces much of that nice observation of men and manners which forms at once the truth and the charm of his philosophical essays. These may be considered to constitute the practical portion of the sensuous system which in this part was left incomplete by Condillac, who confined himself to the exposition and derivation of the cognitive faculties. By 'esprit' Helvetius understood as well the mental faculties as the ideas acquired by them. Both faculties and ideas he reduced to simple sensation, and he accounts for man's superiority over the brutes by the finer organism of his senses and the structure of his hands. Man, he considers, is the work of nature, but his intelligence and virtue are the fruits of education. The end of virtue is happiness, and utility determines the value of all actions, of which those are virtuous which are generally useful. Utility and inutility are however merely relative, and there is consequently nothing which is either absolutely good or absolutely evil. The happiness and enlightenment of the people he makes to be the true end of all human government; and, denying a Divine Providence in the government of the world, he declares all religion to be a cheat and a prejudice.

(*Œuvres d'Helvetius*, 3 vols., Paris, 1818.)

HEMANS, FELICIA DOROTHEA, was born September 25th 1794, at Liverpool, where her father, whose name was Browne, was engaged in mercantile pursuits. He was a native of Ireland; her mother was an Englishwoman, but was descended from a Venetian family through her father, who was commercial agent at Liverpool for the Venetian government. About the year 1800 Mr. Browne, in consequence of the failure of a mercantile concern in which he was engaged, removed his family from Liverpool to an old mansion, spacious and solitary, called Grwych, not far from Abergele in Denbighshire, North Wales. Mr. Browne died not long afterwards. Felicia Browne began to write poetry before she was nine years of age, and her mother, a woman of education and taste, was her first confidant and encourager.

Miss Browne's first volume of poems was published in 1803, and contains some verses written by her as early as 1803 or 1804. A harsh review of this little volume affected her so much that she was confined to her bed for several days. Her second volume, 'The Domestic Affections,' was published in 1812.

In 1812 Miss Browne became the wife of Captain Hemans of the fourth regiment. His constitution had suffered so severely in the retreat upon Corunna, and subsequently by fever caught in the disastrous Walcheren expedition, that he felt it necessary, a few years after their marriage, to exchange his native climate for that of Italy. This at least is the motive assigned for his leaving his wife; but their union, it is said, was not happy, and this separation, which took place just before the birth of her fifth son, closed it for ever. Mrs. Hemans with her five sons went to reside with her mother, then living at Brouwylfa, near St. Asaph, in North Wales.

Mrs. Hemans now resumed her literary and poetical pursuits with increased ardour. She studied the Latin, Italian, Spanish, Portuguese, and German languages. She made some translations from Horace, Herrera, and Camoens, and contributed a series of papers on 'Foreign Literature' to the 'Edinburgh Magazine.' 'The Restoration of the Works of Art to Italy' was published in 1815; 'Tales and Historic Scenes' in 1819; and about the same time 'The Sceptic,' a didactic poem, in heroic rhyme; and 'Modern Greece,' in ten-line stanzas. Her poem of 'Dartmoor' obtained the prize from the Royal Society of Literature in 1821.

When about twenty-five years of age, Mrs. Hemans became acquainted with the Rev. Reginald Heber, afterwards Bishop of Calcutta, who passed a part of every year at Bodryddan, near St. Asaph, and their acquaintance soon ripened into friendship. At his suggestion she wrote her first dramatic work, the tragedy of 'The Vespers of Palermo,' which was represented at Covent Garden Theatre, London, in 1823. It was unsuccessful there, but was afterwards better received at Edinburgh, when Walter Scott wrote an epilogue for it. 'The Siege

of Valence, the Last Constantine, and other Poems' was published in 1828.

In 1825 Mrs. Hemans removed, with her mother, her sister, and her own sons, to Rhyllon, near St. Asaph. Her sister had returned, in 1821, from Germany, where one of her brothers was attached to the Vienna embassy, bringing with her a fresh supply of German books, and Mrs. Hemans's delight in German literature may be dated from that time. Her 'Lays of many Lands,' most of which appeared in the 'New Monthly Magazine,' then edited by Thomas Campbell, were suggested by Herder's 'Stimmen der Völker in Liedern,' and preceded by 'The Forest Sanctuary,' formed her next volume, published in 1827, which was sanctioned, in 1828, by the 'Records of Woman.' Most of these poems were written at Rhyllon, and many of those in the last volume are tinged by the melancholy occasioned by the recent death of her mother, for whom her affection was always exceedingly strong.

In the autumn of 1828, on the marriage of her sister, and the removal of her brother, who was in the army, to Ireland, Mrs. Hemans established herself at the village of Wavertree, near Liverpool, in the expectation of obtaining good schools for her children and pleasant society for herself. She had however little success in either of these objects. In the early part of the summer of 1829 Mrs. Hemans paid a visit to Scotland, and was introduced to Sir Walter Scott, with whom she afterwards spent several days at Abbotsford. In 1830 she published another volume of poetry, 'The Songs of the Affections,' and in the summer of the same year paid a visit to the lakes of Cumberland and Westmoreland. She remained a fortnight with Wordsworth at Rydal Mount, and then took up her residence at Dove-Nest Cottage, near Ambleside. After remaining some weeks, she was induced to make a second visit to Scotland, on which occasion she spent the greater part of the time at Milburn Tower, the seat of Sir Robert Liston. During this visit she formed a friendship, in consequence of which she was induced to visit Dublin before she returned to Wavertree, and ultimately decided on leaving England, and fixing her abode at Dublin.

In the spring of 1831 Mrs. Hemans left England for Dublin, where she took lodgings. Her health, from the time of her leaving England, became rapidly worse, to which the advancing age of the sons remaining under her care was an additional cause of anxiety. The latter months of 1833 were busily spent by Mrs. Hemans in arranging and preparing for publication the three collections of her poems which were published in the spring and summer of 1834: 'Hymns for Childhood'; 'National Lyrics and Songs for Music'; and 'Scenes and Hymns of Life.'

In August 1834, Mrs. Hemans took the scarlet fever, and when imperfectly recovered, caught a cold; ague was superinduced, and never left her till it was subdued by her last fatal malady, dropsy, which before the end of 1834 had assumed an unequivocally dangerous aspect. The summer residence of the Archbishop (Whately) of Dublin was placed at her disposal; change of scene and the kind attentions of the archbishop and his wife afforded some relief, but no permanent benefit; and in order to be near her physicians, she was taken back to Dublin. On the 26th of April 1835, Mrs. Hemans dictated her last poetical effort, the 'Sabbath Sonnet.' She continued to sink gradually till May 12, 1835, when, after a long and quiet sleep, she died without a sigh or movement. She was buried in St. Anne's Church, Dawson-street, Dublin, which is close to the house in which she died. A tablet was erected by her brothers in the cathedral of St. Asaph, "in memory of Felicia Hemans, whose character is best portrayed in her writings." A volume of 'Poetical Remains' was published after her death.

Mrs. Hemans's love of the art to which she had devoted herself was intense, and her appreciation of it was serious and high, as a means to purify and elevate the mind. In her later years her religious impressions became stronger, and her poetry became more tinged with religious thoughts and feelings. Poetry was the object of all her studies, and she sought for its materials in history, voyages and travels, and the fine arts; but her especial delight was to contemplate the scenes of nature in all their aspects of beauty, and to muse upon the associations and sympathies connected with them. Her thoughts are unborrowed, are never vague or indistinct, and always seem to flow naturally from the scene or circumstance present to her mind. She is most successful when the subject is native, something which she has seen, or something which by its associations calls up the sympathies which are familiar to her. Her poetry is thus peculiarly and strikingly the representation of her own character, of the thoughts and feelings of the woman; it is essentially lyrical and descriptive, filled with imagery, sometimes overflowing with it. She has no dramatic power; she cannot enter into the thoughts and feelings of others; she can only exhibit her own. Her tragedy was deservedly condemned. Her great defect is the similarity of tone and treatment which pervades all her works. Many of her lyrical pieces are exceedingly beautiful.

(Chorley, *Memoirs of Mrs. Hemans; Mrs. Hemans's Poems.*)

HEMINGFORD, WALTER, sometimes called HEMINGBURGH, a canon regular of the Austin Priory of Gisburn, or Gisbrough, in Yorkshire, where he died in 1347. His history, which begins from the Norman Conquest, continues to the reign of King Edward II. It

was first published by Gale in his 'Scriptores V.,' fol., Oxford, 1687; and again by Hearn, in 2 vols. 8vo, Oxford, 1731.

HEMLING, HANS. (HEMLING, HANA.)

HEMSTERHUYS, TIBERIUS, the son of a French physician, was born at Groningen in 1685. He entered the university of that town in his fourteenth year, and studied theology and philology under Braun, oriental literature under Schultens, and mathematics and philosophy under Bernoulli. He afterwards went to Leyden to hear the lectures of Perizonius on ancient history, where he was engaged to put in order the manuscripts belonging to the university library. In his nineteenth year he was appointed professor of mathematics and philosophy at Amsterdam, and shortly afterwards undertook to complete an edition of Pollux which Lederlin had left unfinished. Bentley in two letters to Hemsterhuys pointed out the faults of this edition, which so much discouraged Hemsterhuys that he did not open a Greek book for two months afterwards. Conscious of his own deficiencies, he resolved to acquire an accurate knowledge of the Greek language, and for that purpose read through all the Greek writers in chronological order. In 1720 he succeeded Lambert Bos at Fraecker as professor of Greek; and in 1740 removed to Leyden, where he was also professor of the same language. He died April 7th 1766.

Hemsterhuys did not write much, but he was an accurate and laborious scholar; and it was principally owing to his reputation and exertions that the study of the Greek language, which had been greatly neglected in Holland, again became general in that country. He introduced what has been called the analogical system, which prevailed in the universities of Holland for a long time, and which is fully developed in the writings of Lennep. Hemsterhuys was not only a good classical scholar, but he was acquainted with several of the oriental languages, and had a considerable reputation for his knowledge of mathematics and philosophy.

The principal works of Hemsterhuys are:—the latter part of the edition of 'Pollux' by Lederlin, 1706; 'Luciani Colloquia et Timon,' 1708; 'Plutus of Aristophanes, 1744; 'Latin Orations,' published by Valckenær, 1784; Latin translation of the 'Birds' of Aristophanes, in the edition of Kuster; 'Notes and Emendations on Xenophon of Epheesus,' inserted in the third volume of the 'Miscellanea Critica' of Amsterdam. He also edited the early part of the edition of Lucian, which was completed by Reitz. The life of Hemsterhuys has been written by Ruhken.

HÉNAULT, CHARLES-JEAN, born at Paris in 1685, was the son of a fermier-général. He showed at an early age a taste for literature, and wrote several poems. Being made intendant-general of the queen's household, he became by his pleasing address and suavity of manners a great favourite with the high society of the capital. He was also appointed president of the Court of Enquêtes. In 1723 he was made a member of the French Academy. At the age of fifty he withdrew from the fashionable world, and gave himself up entirely to study and to practices of devotion; but his devotion was free from moroseness or superstition. He died at Paris in 1770. The work for which Hénault is best known is his 'Abrégé Chronologique de l'Histoire de France,' which is a very good model of works of that kind. It has gone through numerous editions, and has been translated into several languages. In two small volumes the author has registered under each year every event of any importance in the annals of the French monarchy, from its first establishment to the death of Louis XIV.: with a happy conciseness of expression he has cleared up many doubtful or controverted points, and he has introduced many wise, moral, and political reflections on the character of men and times. The arrangement is clear, and the hand of a man deeply versed in the laws and the records of his country is visible throughout the work. Hénault has had many imitators and continuators. Hénault wrote also 'Histoire Critique de l'Établissement des François dans les Gaules,' and several dramatic works collected under the title of 'Pièces de Théâtre,' 1 vol. 8vo, 1770.

HENDERSON, THOMAS, was the son of a respectable tradesman at Dundee, where he was born December 28, 1798. After an education such as his native town could afford, he was apprenticed to a writer (or attorney) for six years. At the end of this term he was sent to Edinburgh, at the age of twenty-one, to complete his legal instruction. He was then successively secretary to the celebrated judge John Clerk of Eldin, the Earl of Lauderdale, and the Lord Advocate Jeffrey, and in these employments he continued till 1831.

During his residence at Dundee, Henderson acquired a taste for practical astronomy, as well as for the history and literature of that science. At Edinburgh he frequented the observatory, then a very small establishment, but sufficiently well equipped to give valuable opportunities to a learner. Weak health and a tendency to disorder in the eyes are very poor aids to an astronomer, but they did not hinder Mr. Henderson from bringing himself into notice, though his scientific pursuits could only be the relaxations of a life of business. In 1824 he began to communicate with Dr. Thomas Young, then superintendent of the 'Nautical Almanac,' whom he assisted both by methods and calculations. The consequence was, that at Young's death it was found that he had placed in the hands of Professor Rigaud a memorandum desiring that the Admiralty might be immediately informed, as soon as his death should take place, that he knew of no one more competent than Mr. Henderson to be appointed

his successor. The government however confided the trust to Mr. Pond, the astronomer royal, who immediately offered Mr. Henderson, on terms of remuneration, employment for a great part of his time. This offer was not accepted: but on the death of Mr. Fallows the Admiralty proposed to Mr. Henderson to succeed him in the charge of the observatory at the Cape of Good Hope. This offer was accepted; and from April 1832, the date of his arrival at the Cape, he must be considered as a professional astronomer.

After vigorous application to his duties for little more than a year, he found his health and spirits give way. His isolated position and separation from his family, accompanied by the knowledge that he was subject to a disorder of the heart, which might at any time, and which finally did, prove fatal, made him wish to return to Scotland. He came back accordingly in 1833, with a rich store of observations, the reduction of which he imposed upon himself as a voluntary duty. In 1834, by an agreement between the government and the Astronomical Institution of Edinburgh, the latter gave up their observatory to the university, the government agreeing to appoint and provide for an astronomer, who was also to hold the professorship of practical astronomy in the university. On the recommendation of the Astronomical Society of London, to whom Lord Melbourne applied for advice, Mr. Henderson was appointed the first astronomer royal for Scotland. Here, in the midst of his friends, and in the position which, of all that could have been imagined, he would have chosen for himself, he pursued his observations and researches till his death, which took place suddenly, November 23, 1844.

A very full account of Mr. Henderson's astronomical writings will be found in the 'Annual Report of the Astronomical Society for 1845,' with a list of his writings, which consist of upwards of seventy communications, of different degrees of magnitude and importance, to different scientific publications, independently of the volumes of observations which issued from the Edinburgh Observatory. We might particularise what he did on occultations, on the solar and lunar parallaxes, &c.; but it will better suit our limits and the nature of the subjects, to refer the reader to the memoir just cited, and to confine ourselves to a mention of the manner in which his name is connected with the discovery of the parallax of the fixed stars. Mr. Henderson, when at the Cape, repeated the attempt in which Brinkley had failed, namely, the detection of the effect of parallax upon the meridian observations. The stars chosen were α^1 and α^2 Centauri; and the results derived from the former star show discordances, both in right ascension and declination, very much resembling those which parallax would cause. Mr. Main, in his elaborate investigation of the modern claims upon this subject ('Mem. Astron. Soc.' vol. xii.) says that in the event of a parallax at all comparable to that assigned by Mr. Henderson being ultimately found to belong to the star, he will deserve the merit of the first discovery. Mr. Maclear, Mr. Henderson's successor, made a new series of observations on the same stars, with a different instrument, from which Mr. Henderson produced results very nearly agreeing with his own.
